The articles seem to be an attack upon what the writer terms "the cranks who preside over our State fisheries" for the passage of laws to which he objects. From my knowledge of the Commissioners, I seriously doubt if any one of them would dignify the articles with a reply of any sort. They do not make the laws and are not responsible for their passage, except as they may recommend certain measures and oppose others (a privilege granted to every citizen in the State as well as to the Commissioners), which their official experience teaches them are best to advocate or combat, and in their capacity of advisers they are far more competent to make suggestions, from the very nature of their official positions, as to what the laws should provide than one who shows his utter ignorance of the subject and his unfitness to write of it without prejudice, when he speaks of "the Fish Commissioners, who think it high treason for any one but a sport to capture such a specimen"—referring to a fish.

The tenor of the whole article makes it read like a grand-stand play on the part of some interested party to capture the farmer for some purpose or another, but I believe the farmers are much too intelligent to be fooled by any such gold brick game; for I must assume that the very small number of farmers who could in any way be affected by the statute complained of have no desire to wipe out a law which would result in the extinction of a food product which in the seeking by the people is the means of healthful recreation to thousands. But here is the article to speak for itself under

A Law that Greatly Injures the Farmer.

There are times when brook trout sell readily in the New York market for prices ranging from 50 cents to $1 per pound. In many parts of the State, especially in counties like Delaware, where springs abound, trout could be artificially propagated and grown for market purposes, and the business could be made to yield a desirable addition to the farmer's revenue. But he cannot do this business under the existing laws. He may build his pond and, by stealth, may stock it, but he cannot take the fish from it save by hook and line, though the pond is his own, and the fish are as much his own property as the fowls in his poultry yard or the cattle on the hillsides. No other human being has any right to them, no one else may catch them. The law forbids him to take them with a net or by drawing off the water, so it destroys a possibly lucrative business. But if he were allowed to catch them he must keep them at home or throw them away. Parties in the city might and probably would be glad to pay him $1 a pound for them, but the law steps in and says emphatically "No." In order that our readers may see the odious character of the law, we transcribe Section 109 of the game Law. [Here is printed the law which forbids the transportation of trout of any kind unless the fish are accompanied by their owner.]

There you have it. The city fisherman may come up in the mountains for a day's fishing and in most cases he is welcomed. When he has filled his creel he may give it to the expressman on the train on which he himself returns or he may carry it with him undisturbed by the law. When he gets the fish to the city he may sell them, eat them or throw them into the sewer. On the other hand, the farmer may catch his own trout, not from public streams, but from his private pond, but he cannot send them nor may the express company carry them for him. It does not need a profound intellect to see that such laws are outrages, that they are tyrannical and unjust. The instance quoted is only one of a multitude of phases of the law which must be mitigated. The trout in a private pond are the property of the owner and he has a moral right to catch them when he pleases, eat them when he pleases or send them where he pleases, unhampered by the law. That is obvious to any one with a spoonful of brains.

The conditions described in this bid for the farmer's support are, aside from the quoted law, it seems to me, wholly imaginary, for I do not believe there is a farmer in the State who can, as an adjunct to his farming, build a trout pond, rear trout artificially, feed them till they reach a marketable size and make a dollar at the business, provided the statute complained of was wiped from the books.

It has been tried by trained fishculturists who have given their entire attention to it, and as one expressed it, he hauled his food for the fish to his ponds in a two-horse wagon and carried his trout to market in a basket on his arm. There are a number of successful fish farms in operation in this country, but they are not a side issue to raising wheat and corn, and they are under the direction of competent fish breeders trained to the business, who devote all their energies to the work of fish rearing.

I am not sure that any one of them, even under the most favorable conditions of water, temperature, situation, and natural food, would be successful financially if they aimed only to raise trout for the table, to be sold in the open market. The chief objects of these fish farms are to furnish impregnated ova, fish fry, yearlings or older fish for stocking or restocking other waters, but this requires more skill and more training than it does to plant a hill of beans. If a farmer has a natural trout pond, all his very, very own, which is self-sustaining, and he desires to dispose of surplus fish, he finds the best market for the fish at his own door. Not to the "sport" mentioned, for sports are gamblers and prize fighters—and I never heard of one of these being an angler—but to the sportsman from the city or the country (is it not funny that some people have an idea that all sportsmen come from the cities?) who will pay a good price for fishing a wild trout pond; or, if the farmer prefers to catch his own fish and then sell them, he will find a better market and deliver them in a better condition in his market town.

One dollar a pound for trout is very alluring to some people when they see it in type a long way from the market place, but as yet there are no free pneumatic tubes by which trout can be shot to markets, and ice and express charges make a hole in the price of each pound. Furthermore, the extremely high prices given for brook trout in the New York market are given for live fish. A writer upon culinary topics in a recent issue of a New York city newspaper said: "The black bass, brook trout and lake trout cannot be found in their best condition in our markets because they lose flavor in every hour they are out of their native waters. To be properly served they must be cooked in the simplest manner as soon as they are caught, and their fine flavor left undisguised by sauce of any kind."

If I were a farmer who desired to try the experiment of a private fish hatchery on a private trout pond in rearing fish for city tables, I would hesitate about accepting advice from one who intimated that the first thing to do after building the pond is to break a law of the State and rob the people before I could commence business.

The people of the State are taxed that the public trout streams may receive contributions of State fish to maintain the supply, and Section 103 of the game law makes it a misdemeanor, with penalty attached, to rob the people of their fish and place them in a private pond, and yet the farmer's advocate in his editorial says to the farmer that he may build his pond and "by stealth he may stock it," and then goes on to prate of fish thus stolen from the taxpayers of the State as belonging to the farmer as much as "the fowls in his poultry yard or the cattle on his hillsides."

No matter what he said after that, I would be afraid that his purpose was to land me in jail while he professed to be my friend, and was trying to sell me an elegant gold brick in the shape of a chimerical trout pond to sink my money in that I had made from my corn crop.

This would-be reformer of our laws that have not a spoonful of brains in their construction, according to his idea, says that "the trout in a private pond are the property of the owner, and he has a moral right to catch them when he pleases, eat them when he pleases or send them where he pleases, unhampered by the law."

Not so; and for the same reason that we have laws which protect the people from bob veal and milk from swill-fed cows. A trout after spawning is a poor, miserable, slimy creature, no better for food than bob veal, and no one has a moral or legal right to send such fish to market for human food, and the people are guarded from such an imposition by the close season for trout. Trout cannot be caught or possessed during this breeding

season, nor for a sufficiently long time after to enable the fish to recover from the exhaustion of spawning and to regain their normal, healthful condition. The people attended to that matter without having to resort to the boards of health for action, and "it does not need a profound intellect to see" that it would be an abominable outrage to exempt the farmer or men of other vocations from the operations of such a righteous law simply that they might profit financially because they happened to own a trout pond that no other human being has a right to approach. Why should the farmer or the minister or the horse editor of an agricultural newspaper have a law enacted for their individual and imaginary benefit when such a law would work injury to the rights of the rest of mankind?

Let us see what led up to the passage of the law complained of, a law which has been in operation for seven years, a just and reasonable law, favored evidently by a large majority of the people or it would have been repealed before this. In this State laws that are "tyrannical and unjust" do not remain for years on the books, for the people have a way of expressing themselves through their representatives in the Legislature when it is known that a bad bill has become a law. Sometimes they are a little slow to act, as in the case of the law which permits the sale of game at all seasons and puts a premium on crime in our neighboring States, a condition of things similar to that advocated by our agricultural friend for the sale of trout, but they will arouse themselves over this game matter as they have already aroused themselves over the sale of trout when they fully understand the injustice of it.

The natural history of the brook trout is unlike that of any other fish in the State, and the trout requires peculiar conditions to exist at all. It will not live in warm water like the pike; it is not a fish of civilization like the black bass; it is not a spring spawning fish like the pike-perch, and it is the least prolific of our food fishes. The smelt, the pike-perch, the pike, the mascalonge, the pickerel and the shad may produce from 50,000 to 600,000 eggs for each female fish, and all are spring spawning fishes, which means that it requires but a few days, comparatively, for the eggs to hatch, and the fry can swim away and disperse through the water as soon as they leave the egg, or within a few days after. The black bass is also a prolific spring spawning fish, but I did not mention it, as it is the one so-called game fish that broods its young after they are hatched. All the fish mentioned will thrive in waters where trout cannot live because of the high temperature, and they will thrive in waters of commerce where trout will not stay if they can get away. The trout is a shy fish, a fish of remote mountain streams and ponds removed from the ordinary haunts of mankind. A two-year-old trout may yield 150 eggs or it may yield twice as many. The average yield of two and three-year-old trout may not be over 500 eggs, and when they get to be four and five years old they may not yield more than twice as many. The eggs may hatch in fifty days or it may take 156 days to hatch them, and after the little fish are hatched it will be another thirty days or more before they are relieved of the burden of the umbilical sac and are able to swim unhampered. During all these days, from the time the eggs are deposited until the fry swim freely, they are the helpless prey of countless enemies. In a state of nature comparatively few of the eggs deposited by the fish are impregnated—in one case where the eggs of the salmon were counted in a Canadian salmon river only two per cent. were found to be impregnated. All these facts combined, that the trout is not as prolific as other fish; that only a small percentage of its ova is unpregnated; that it requires months to hatch the eggs, and that the eggs and fry are subjected to unusual casualties, and are surrounded during the entire period of helplessness by a horde of enemies, make it necessary to surround the fish with every safeguard that the law can provide, and at the same time do everything that the science of artificial propagation can suggest to keep the species from extermination. Because trout waters are remote from ordinary observation, they are the more easily despoiled, and it is simply impossible for the force of protectors furnished by the State to watch over them all at all times. There is a poetic halo about the very name of the trout not shared by any other fish. A boy does not feel that he is a full-fledged fisherman until he has caught trout, and men will eat trout simply because they are trout, when a fresh bullhead would be much better and cost much less.

Under the circumstances it is not at all remarkable that the fish command a high price and are sought in season and out of season by various kinds of law-breakers, some tempted by the price and some by the desire to possess trout.

It was not possible to protect the trout streams and ponds for the reasons given, and they were netted by night and by day and shipped by express to market—generally a summer hotel. Once in the possession of a netter, it was out of the question to prove how he caught them and he openly boxed and shipped them. There was one way to reach this class of offenders and that was the transportation clause. He might go to the innermost recesses of the forest and net trout free from observation, but when he brought them into daylight for transportation to market he was met by a law that stopped the business in a great measure, and the same law was afterward applied to deer and game birds with beneficial results.

Admit, for the sake of argument, that there were fifty or more private trout ponds in the State, the owners of which might make a profit from the sale of their trout if the transportation clause should be repealed, would it be just to all the rest of the people in the State to remove this safeguard and permit the old order of things to come in and open every trout water in the State to those who have no fear of the law provided they can get their fish to market after they are netted? It is not imagination on my part that this would be the result of a repeal of Section 109 to benefit a favored few, for if the farmer was allowed to ship trout at any time the poacher would do. Before this section became a law I was at a summer hotel for two seasons and saw the boxes of trout received there from the Adirondacks. The proprietor received and paid for more than he could use because, as he explained to me, if he did not take what was sent the supply would go to some other hotel. It was a moral certainty that every trout so received was netted, and the hotel-keeper and I both knew it, but it could not be proven in court. The trout came such a distance and were so long on the journey that no one who knew what a fresh trout was would care for them, but there was a demand for them all the same. I know positively that the law stopped that traffic, as it did similar traffic elsewhere in the State, and nothing but the transportation clause could stop it. If it is repealed, artificial propagation and all that nature can do to keep up the stock of trout will not save them in public waters for any great length of time.

A. N. CHENEY.

MEN I HAVE FISHED WITH.

XVI.—Corporal Henry R. Neaville.

HENRY had the taste for observing the habits of beasts, birds and fishes which leads a man to study them, a taste which may, if not checked, cause him to count the fin-rays of a fish or the scales on the tarsus of a bird and then inflict his fellow man with a monograph on fin-rays and scales. Henry never reached that stage, but loved the woods and waters just the same, and was a very quiet companionable fellow of my own age. His father kept the only hotel in Potosi at that time, and Henry and his younger brother Frank were kept by the hotel. Few things troubled Henry; with him "it was always afternoon" and pleasant visions floated in his mind; yet he was not indifferent to the passage of time if aroused by something which interested him. In still-hunting deer he was tireless and no amount of fatigue dulled his ardor. If, however, wood was to be cut for the house Henry somehow never took an absorbing interest in it, and it soon turned out that Henry and I had many traits in common.

We fished for crappies, another fish new to me and one which I considered the best pan fish in the Mississippi. This is the fish, or brother of the one, called "strawberry bass" in western New York, and if my youthful judgment was correct it is a fish worthy of more attention from fish-culturists than it gets. There is a chance that my more mature palate would confirm the verdict of forty years ago, for I never did care to eat a black bass if perch could be had, and residence by salt water has intensified this preference. My friend, Prof. Jordan, says the crappie should be called *Pomoxys*, and in his "Manual of Vertebrates" gives what he thinks the word means in Greek; but I guess the name comes from the Latin *Pomum*, fruit, for the crappie is, in the argot of the day, "a peach"; a few years ago it would have been "a daisy," and so in the process of evolution the fruit succeeds the flower. Darwin, "thou reasonest well!"

A tree top was a favorite place to find the crappie and incidentally to lose fish-hooks. We used short rods, cut in the woods, but not over 7ft. long, for fishing in the tree tops, and the crappies were flat as a pancake and sometimes a foot long. In a tree top if one of them was allowed a bit of line the angler was lucky if he saved the hook. They fought fairly well too, of course not to be compared to the fight of a black bass nor of some perch, but it was sport to take them. We strung the fish through the gills and hung them in the water to keep alive. Once while pulling in my string to add another it pulled heavily and a catfish, which looked to weigh 10lbs., came to the surface. It had swallowed one crappie, but let go when it saw us. Soon after this Henry put his hand in the water and a big catfish seized it and tore the skin badly, causing him to make remarks calculated to hurt the feelings of all catfish which heard them.

As my mining partner, Charley Guyon, never objected to having a holiday, it happened that Henry and I fished frequently in the summer, and hunted for ducks, deer and other game in spring and fall. Shortly after Guyon's adventure with a buck, related last week, Henry and I were following deer up the Grant River, and I saw three of them cross to my side within easy shot. There was a buck and two does. As they came out of the water I dropped the buck, and like an echo of my shot one of the does fell. Henry took off his clothes and swam over and found me talking with a man about fifty years old who had killed the doe. He proved to be a French-Canadian named Antoine Gardapee, with whom I struck up a friendship which will be related "in our next." He was a trapper, and like my old friend Port Taylor was a "character." We dressed our deer, and Henry and I swam the river with it and took turns with the heavy saddle wrapped in the skin and the lighter forequarters.

Gardapee came to town with us and sold his venison. In those days many men threw away the forequarters of a deer. I asked Antoine to come to my house for dinner, and he did, but he insisted that a rib chop out of a fat deer was the best portion, and we had them broiled. He was right, and to-day I follow his advice when venison is in season and buy rib chops. He took a fancy to me because our tastes were in common and I had education enough to write his letters to his friends, and would talk to him on subjects in which he was interested. I looked up to him as a combined Port Tyler and Natty Bumpo rolled into one. It was a sort of love at first sight, or like that of Desdemona for Othello, of which he says:

"She lov'd me for the dangers I had pass'd;
And I lov'd her that she did pity them."

Henry Neaville had that keen sense of humor which often accompanies a poetic temperament and permits one to both enjoy a sentiment and to burlesque it at the same time. This is a possibility unknown to solemn souls who think burlesque or travesty irreverant or disrespectful, which it is not always intended to be. Byron had this faculty in perfection, and lets you down from a poetic flight with a d. s. thud. Shakespeare turns from heroic Hotspur to fat Jack Falstaff—and Henry Neaville, who had a considerable knowledge of Shakespeare, often paraphrased him. This is what called up the above quotation. Henry once said:

"She lov'd me for the fishes that I caught,
And I lov'd her that she did pickle them."

Frank Neaville, Henry and I one summer day went fishing, and we rowed up against the current of Swift Sloo and around into more quiet waters, made fast to a tree top and dropped our lines. Tree tops in these waters were abundant where the freshets had washed the soil from the roots, and the tree toppled into the water; usually it kept on growing, or at least in full leaf during the season, and afforded a good place to tie a boat and fish either among the branches or further out. A queer tapping noise came from the boat's bottom. I suspected Frank of making it because he was full of tricks of that kind, but they kept up and he did not seem to be the cause.

"Are there spirits among us seeking communication with mortals?" I asked.

"Yes," said Henry, "and I'll try to call that particular spirit from the vasty deep, and find out why he knocks on our boat."

"He wants to come in," Frank explained, "and he's too polite to do it without knocking first."

Henry put on a plump worm, took off the little bullet which served for a sinker, and let his line drift under the boat. In a short time it was evident that something was tugging at his line, and his little rod bent as the spirit, or whatever it was, struggled to get loose. Soon a large fish was pulled from under the boat, and made several kicks and splashes before it was flopping at our feet, showering water and scales. It was a "red-horse," and would weigh about 2lbs., guess weight.

"Is that the cause of the spirit-like raps on our boat?"

"Yes, he was sucking off snails and water worms. Did you never see 'em do it?"

"No, never heard of such a thing before."

"Here's another at it now; come over this side and you can see it. Come still and don't rock the boat, or you'll scare it."

I went and saw about half of the fish extending beyond the boat. It was on its back and its red fins looked bright against its white belly and straw colored sides. At every tap on the boat a slight contraction of the body was observed as he sucked his food from the boards. Frank thought he could capture the fish with his hands and tried it, but had to fish his hat from the water instead. "Golly," said he, "that fish was quick. He jumped when I touched him and slipped through my hand like an eel." After this the drumming of the red-horse was often heard, not only on the boat, but upon logs that were several feet from us. This sucker is the "mullet" or "red mullet" of western New York. It is eatable in cold weather if it is the best you can get.

Henry threw the fish overboard, saying: "Might as well let it go; we never eat 'em in summer. I only hooked it for fun and to show you what made the tappings on the boat. Don't you have red-horse where you've fished? There! Look over on the bank of the sloo. Keep still, Frank, sh!"

A queer-looking object was rolling about on the shore in a singular manner. It grew large and then small. Sometimes it was the size of a small cat and then would increase until as big as an old Thomas. It twisted, rolled sideways and back until it reached the water, where it kicked up a great bobbery.

"I'm durned if I know what that is," said Henry, "I never saw such an animal before. What do you think it is?"

"It's a coon rolling in the dirt and then washing himself off," said Frank.

Henry sneeringly replied: "Coon! yer granny! A coon's got a big bushy tail and is gray. Frank, you don't know a coon from Driesbach's pet leopard."

By this time the splashing ceased and one animal crawled out of the sloo dragging another. Henry and I said in chorus: "It's a mink!" So it was, but he had a muskrat with him, and musky was dead. Our exclamation startled the mink, and it jumped into the grass with its prey. I said to Henry: "That sight is worth more than all the fish we have caught and all the mineral Charley Guyon and I might have dug to-day, or for a week. I knew that mink were fond of muskrat meat, but a fellow might fish for a lifetime and never see a mink kill one."

"What made the mink hurry off so?" asked Frank, "he wasn't in any hurry about killing the muskrat. I'd like to have seen him eat it.

"Frank," said Henry, "that mink had several good reasons for hurrying off. It was dinner time and Mrs. Mink and all the little minks were wondering why papa didn't come home from market with the dinner. Then Mr. Mink may have thought his family might mistrust that he was lingering at Sam Coons's bar and would forget to bring any dinner at all; but the chances are that when we spoke he looked over at us and thought: 'It's best to hurry home before that durned fool, Frank Neaville, asks me a whole mess of questions.' That's the reason he went off so suddenly. Frank, he took one look at you and saw your mouth wide open ready to ask him a question and he sneaked."

Frank looked at me and said: "Henry knows a heap o' things, but somehow nobody seems to realize it but himself. He knows just why that mink hurried off as well as I do, but he won't tell the truth. Now, I'll tell you why he skipped out: the mink was so interested in his fight that he did not notice us until Henry called out. Then he looked over here and said to himself: 'There's that mean Henry Neaville and he'll take my musquash if I don't get out. That fellow is mean enough to take acorns from a blind sow.' And so that mink, which would have been delighted to have eaten his dinner in decent company, sneaked off with it into the woods for fear he would be robbed."

I had taken my rifle along because the boys thought it would be well to kill a pig on our return, and as I had "bought into a claim o' hogs" we went ashore, and after some work among these very wild animals I got a shot and dropped a "likely shoat" that would dress about 60lbs. After skinning the pig we laid it across the bow and rowed around into Swift Sloo about sundown. The strong current was taking us along toward home when Frank saw a wounded pelican near shore and grabbed a tree top to hold the boat. Quicker than it can be told the sudden check in the swift current filled the boat and it left us in the water. Henry was in the stern steering with one oar and fortunately grabbed the painter and held on. Frank and I got out from the tree top and struck for the nearest shore. A bend hid the boat and Henry from sight by the time we landed and then Frank began to cry: "Henry is drowned, I know he is, and all on account of my foolishness!"

I consoled him as well as possible by saying that his brother was a good swimmer and must be on land below the bend, and then we heard his yell, "Yee-e-e hoo-ooo," and answered it. We went down to him, and found that the boat and one oar was all there was left, except the three strings of fish which were tied to the gunwale.

"Well, we might as well go on home," said Frank.

I thought a moment and said: "You boys can go if you like, but my rifle is in the sloo near the tree top and I'm goin' to stay on this island and try to get it when morning comes."

The boys decided to remain after I produced a little bot-

tle of matches, a trick learned from my old preceptor, Port Tyler. Said Port: "You don't never want to go a-shootin' nur a-fishin' with yer matches loose in yer pocket, nor in one o' them metal match boxes; they leak, an' if ye get caught in a rain or tumble in the crick yer matches are all wet when ye want 'em most." The lesson had been firmly implanted by a neglect to follow it on one occasion, and here was proof of the wisdom of the old woodsman. At such a time, when wet, cold and hungry, one good match was worth a king's ransom, and I had it. Dead wood was plenty, and the little breeze which kept the mosquitoes from the open sloo was not felt in the underbush. Before the fire we stripped and spread our clothing on poles cut for the purpose, and then—there is a dim remembrance of three fellows trying to keep their bodies in the smoke and their eyes out of it.

This was a mosquito paradise, for them. For us the term might be reversed, and it would require the pen of Dante to describe the place. Still, most readers of FOREST AND STREAM have sat in smudges and have wondered whether it were nobler in the mind to suffer the stings and poisons of tormenting 'skeeters or by smudging end them. "Smoke follows beauty," is the adage; but when sitting in a smudge of dry fungus we old campaigners know that we are not beautiful because the smoke dodges us. Sometimes it is a question whether the insects are not to be preferred to smarting eyes, but eventually the ayes have it, and more smudge is made.

Our lunch was saved and there was plenty of it—but the bread was soaked too much to use, the pies which Mrs. Neaville had put in the basket had disintegrated, and the ham and chicken had been eaten. We slapped mosquitoes and roasted fish and shifted to keep in the smoke. When the fish were cooked we ate supper.

"Where's the salt?" asked Frank.

Henry looked up and quietly said: "Frank, look in the basket; you'll find the salt tied up in a rag; bring us some;" and he never cracked a smile while his brother held up the soaked rag, looked at it, and threw it down. "I never like salt on fish," said Henry, "it makes me think they're not fresh." Frank and I ate fresh fish and made no comment. After dinner Henry took his felt hat and went to the sloo and brought it up full of water. Said he: "I always want a drink after a fish dinner, and of all the drinks in this world there's nothing like Mississippi River water; it's rich, food and drink too, and there's no better place to get it than from Swift Sloo! Boys, here's fun!"

It was desirable to get our clothes on at the earliest moment, so that there would be a minimum of cuticle exposed to the enemy, and after dressing we could dry the garments from the inside as well as by the fire, so we dressed and dragged the boat ashore, turned it over and slept the sleep of the just under it, leaving the hordes of mosquitoes to sing us a lullaby on the outside, while only a few of them found entrance from the ground.

Frank said: "I've had enough of this, and I'm going to get up!" And it was morning—broad daylight! The dawn had been obscured by the heavy timber and the overturned boat. A breakfast which somehow was much like the supper, in the presence of fresh fish and the absence of salt and everything else, was satisfactory to all but Frank. He said: "If I only had a cup of coffee I wouldn't care."

"Frank," I replied, "you are not an epicure. There is no more delicious breakfast known than roasted crappie cooked without salt and washed down with water from Swift Sloo. Your palate is not educated; coffee just now—hot coffee, I mean—would spoil the combination; you don't want coffee, nor anything else."

"Coffee!" exclaimed Henry, "why, coffee would spoil the taste of those delicate crappies, which all epicures eat without salt." And then he added: "Coffee would queer the whole show," a remark which made me ask if he had gone off with Charley Guyon, Montpleasure and the others on their trip into Iowa, and he admitted that he had been the treasurer of the troupe. How little things serve to show what will "queer" a larger thing! I asked: "Henry, what was it that 'queered' our trip?" And he simply answered: "Frank."

Don't think that Frank was any sort of a "hoodoo" because we guyed him in this way. He was a good, honest boy, but had no taste for camp life—hunting, fishing and mosquitoes. He afforded plenty of sport to his brother and I because he was green at these things. He wanted to know what there was interesting in seeing a mink kill a muskrat.

Henry replied: "Why, you bloomin' idiot, you might live in the woods for fifty years and never see such a thing but once.

"Well," drawled Frank, "after you've seen it what does it amount to? You knew that mink killed muskrats and what more is there to it?"

Henry was dazed at this practical question, and no one replied to Frank. What could you say? If a man has no liking for a thing, what can be said to prove that he ought to like it? We could only feel sorry for a fellow who had no care to observe animals in a state of nature when they were unaware of the presence of man. If a man doesn't care for literature, science or art, there's no use talking to him about them. This may be illustrated by the following story: Two fellows had journeyed from New York to see Niagara Falls, of which they had heard much. As they came in sight of the mighty cataract one said: "There, Jim! them's the falls!" The other asked: "Is them the falls?" and added: "Them's nice falls; now let's go and get some beer." That, I think, puts the case fairly—perhaps as strongly as that of "casting pearls before swine," but not in such an offensive manner. If Henry Neaville was alive to-day he would spend a week to see that solitary animal, a mink, capture and kill his prey in the manner one did when we were fishing near Swift Sloo. Frank had no interest in such things.

We cut a stiff pole, and with our remaining oar poled and paddled back to the tree top, where Frank capsized the boat in order to look at the wounded pelican. After a survey of the bottom we found the spot where the rifle lay, and I undressed and brought it up at the first dive, for the water was not more than 6ft. deep, there was no mud to cover the gun in the swift water, and it lay within 3ft. of where the boat upset. We then saw where a board had lodged in the last freshet, and as our loose seats were gone I proposed to replace them with the board.

"But you have no saw. How are you going to cut that board to make two seats?" asked Frank.

I showed him how to cut a board off square with a pocket knife by taking the measure and following the mark with the point of a knife. Then slightly bending the board at the mark and drawing the knife in the cut, taking care not to bend it too much; the fibers separated with a snap under the point of the knife and we had two seats with ends as square as if sawed. It was done so quickly that he was surprised and I showed him how a small tree could be cut by a sharp-pointed knife if the tree could be bent so as to strain the fibres, and he very ungrammatically remarked: "Well, I'm be blowed!"

Henry Neaville was one of those rare fellows who are charming companions in camp—one of those cheerful men who never grumble no matter what happens. It might rain and wet him to the skin when there was no chance to make a fire; he might lose his fishing tackle when no more could be had and he would joke about it. He would be happy when it was a choice between being eaten alive by mosquitoes or being smothered and blinded by smoke. Mark Tapley could not have been jollier under adverse circumstances than was Henry Neaville. I was with him a year and a half later in camp in northern Minnesota with a surveying party and saw him come in with both feet frozen so badly that I feared amputation might be necessary, and as I dressed his feet afterward when they were swollen almost to bursting he said: "If you should have to cut these feet off just box 'em up and send 'em back to Potosi and write father to tell the girls that I'm not dancing this winter." That I loved such a cheerful companion is not strange; any sportsman would have taken him to his heart, for if there is a disagreeable quality in a man it will show itself in camp. If he is cranky, cross or grumbly it will come out in time, and if he is a hog who will take the choice corner of the tent every time, or the best fish in pan, it is soon known, and right here let me say I have met many such: men who seemed to think that no one was wet and cold but themselves, nobody tired and hungry except their own carcasses; one trip with them is always enough. They are the fellows who will shoot across you at your birds, throw out their lines alongside yours if they see you have a nibble, and in many ways, beside bragging of their personal prowess, make themselves disagreeable. You've all met 'em and dropped 'em. I will tell you more about Henry two weeks later.

We drifted down Swift Sloo and poled and paddled to the landing, made the boat fast, and marched through the partly deserted villages of Lafayette and Van Buren to picturesque Potosi. Mr. Kaltenbach, who had been postmaster for some twenty years then and who recently died in office, the oldest postmaster known to the service, hailed us with: "Hello! boys, did you get so many fish that you couldn't carry 'em?" But Henry told him that several wagons were on the way with our catch. John Nicholas and Bill Patterson wanted to know if we forgot to spit on our bait, but they got no reply. We had enjoyed the trip, that is, Henry and I did—it was not certain about Frank, and it was useless to try to explain it to people who measure your fun by the amount of game brought back, a most false measure and one that should come under the supervision of the State "sealer of weights and measures."

In the fall Pete Loeser, who you will remember came from Albany with me, sent an invitation to go up some fifteen miles to Fenimore Grove and shoot prairie chickens. Henry went along and was enthusiastic about the sport, which could not be had in the heavily timbered district near Potosi.

On the drive to Lancaster Henry learned that I had never seen a prairie hen alive, and he gave me an account of the habits of the bird and how they went in flocks like quail, and while scattered about feeding would rise by dozens, by twos and threes and single birds, affording a chance to use both barrels and often to load again before the last bird took wing. Said he: "I've heard you talk about partridge shooting, but it beats that all hollow. Why, the partridge is not to be named the same day when we talk of prairie chickens." Such talk naturally raised my expectations of great sport with a new and untried game bird which was said to excel the ruffed grouse as an object of pursuit, and when we met Pete and he said, "The tay vos yust ride, und dere was t'ousands of bra'rie shickens in de wheat stubble und de cornfields," we were elated.

We had no dog, but we spread out at proper distances to take in cross shots without interference, and walked the birds up. The ease with which they were dropped surprised me after being wrought up by Henry's extravagant talk. On our return with big bags of this fine bird, Henry asked what I thought of the sport and I summed it up in about this style: "Henry, the prairie chicken is a fine large bird and a good game bird, but as a bird to shoot it is easier than the little quail; it flies in the open, and in such a way that a duffer could hardly miss it if within range. It doesn't compare with woodcock shooting in a thicket as a test of skill, and as for partridge, I tell you that there is a feeling of triumph in downing a wary old bird, which starts like a rocket and puts a tree between you and himself before he has gone 10ft., if the tree is there, that the killing of 100 prairie chickens cannot equal. Come with me some day and try them back of the river bluffs toward Cassville, and if you don't agree with me when we return I'll eat my hat." [Since this was written I have read the excellent article on ruffed grouse by Mr. Waters in last week's paper, and he and I agree on this point.]

Since that day I have shot prairie chickens in Kansas and in other States, and still adhere to my opinion concerning the merits of the two birds from the standpoint of a sportsman whose object is to bag a difficult bird regardless of whether he gets two or twenty. For the table I prefer the dark-meated prairie fowl, but that is another question. Also I would say that up to that time I had never seen nor heard of the practice of treeing partridges with a dog. It is only in sparsely settled districts where this can be done, and it was many years after that I had practical knowledge of this method of shooting. About the thickly settled districts of New York, where I learned to shoot, the ruffed grouse would never take to a tree for a yelping spaniel; they crouched for a spring at the approach of man or dog, and often the thunder of their wings was the first intimation the gunner had of their presence, and he was lucky if he could flesh his shot before the swift bird had put a tree between them. It was largely snap shooting, and, as I have said, the feeling of triumph in dropping one under such conditions was great, and there were men in that day and there are men to-day who will agree to every word of this. At the risk of calling down a host of antagonists who will go for my scalp, I will say that the grandest game bird of America is the ruffed grouse, called "partridge" in New York and New England, and "pheasant" in Pennsylvania and the South. The wild turkey is a wary bird and carries more meat about his person, but an experience in shooting both makes me put the turkey in the second place.

This talk has led me from Henry Neaville, whom I wanted you to know, but a vagabond pen wandered from the subject. I will tell you something of him later on, for he and I joined a party of Government surveyors a year later that explored a portion of northern Minnesota; but before we get to that I must, in the natural order of events, tell you about a winter spent in trapping for fur with Antoine Gardapee, whom you met in the first part of this article. Henry was my intimate companion on the surveying trip and afterward; we had so much in common that we could not keep apart if we had tried.

In gathering information about my old-time friends I was pleased to find that Hon. J. W. Seaton is still living in Potosi. During the time of which I write he published a weekly paper there and was afterward a member of the State Senate for several terms. He writes me as follows: "Bill Patterson is living at Portland, Ore. All your other friends are dead except Thomas Davies, who went with you on the surveying trip. Henry and Frank Neaville went out with Company C, 2d Wisconsin Infantry, afterward part of the famous 'Iron Brigade.' Henry was made a Corporal and Frank was First Sergeant. Frank was killed at Bull Run Aug. 28, 1862, and Henry was killed at Antietam nineteen days later."

"The neighing troop, the flashing blade,
The bugle's stirring blast,
The charge, the dreadful cannonade,
The din and shout are past;
Nor war's wild note, nor glory's peal,
Shall thrill with fierce delight
Those breasts that never more may feel
The rapture of the fight."

FRED MATHER.

GEORGE DAWSON'S LETTERS.

LANSING, Mich., Sept. 26.—I have just returned from a visit to my old home in the State of New York. Before I started for the East I read Mr. Fred Mather's article on George Dawson, and it reminded me of a circumstance. When I was a lad, living on a farm near Batavia, N. Y., the Albany *Journal* was one of the papers which came to our house regularly for many years. Mr. Dawson was at that time in the prime of life, and every season for many years he took his outing in the Adirondacks. Every week while he was in the woods the *Journal* would contain a lengthy article giving a detailed description of his doings, and I need not tell you that I looked very anxiously for the coming of the *Journal*, which would tell me all about Paul Smith's, and the big trout, and the wonders of life in the big woods. Every week for some years I would cut out these articles, roll them together and put them away, with the expectation of some day making a scrap book. But the war came upon us and I left my home, and when events brought me home again I was a bigger boy and had other hopes and aspirations, and I drifted away, never to return nor to know what a pleasant reality my early home life had been.

During all of these years I have often thought of that big roll of clippings, and when I was at our old farmhouse home a few weeks ago I hunted the house high and low, from cellar to garret, in hope of finding the articles, but it was all in vain; I could get no trace of them. To be candid—it seemed to me but yesterday that I could pick them up, read them over and carefully roll them up again and put them away in the big drawer, but thirty-five years have passed since then. Do you wonder that I want to thank Mr. Mather for his articles, and to say to him that I enjoy reading them very much?

Mr. Genio C. Scott, another of Mr. Mather's fishing friends, was also an early time acquaintance of my own. This was some years before he wrote "Fishing in American Waters," and he was making notes at the time for his book. I spent three days with him at Silver Lake, in western New York, about that time, and I well remember the talks we had about the book and what he was going to say in it. One thing about his fishing I shall never forget: at Silver Lake the fishing in those days was all done by trolling except an occasional cast with a crab after bass, but Mr. Scott insisted upon standing up in the front end of the boat and with a heavy bass rod and small spoon cast among the lilypads for hours, and I do not recall that he took a single fish. He laughed about his bad luck and said that the only trouble was that the fish at Silver Lake were not educated and did not know a good thing when they saw it. So Mr. Mather has again freshened my memory and taken me back to pleasant days in early life. I wonder how many men in this country can appreciate the articles which Mr. Mather is writing, and draw upon memory for something of actual fact to illustrate the days that are past and gone.

JULIAN.

Some Iowa Fishing.

CHARLES CITY, Ia.—Pike fishing has proven exceptionally good below the dam on the Cedar River this the first few days in October, the writer and one other party having secured fourteen wall-eyed pike weighing 42¾lbs. The five largest weighed as follows: 7¼, 6½, 4, 3½ and 3lbs., the other nine averaging 2lbs. apiece.

Seven miles above here, on Sept. 30, Dr. Sitzer caught six of the largest small-mouthed black bass taken (at one time) from these waters in years, the lot weighing 18½lbs., the largest one 4¼lbs.

While fishing three miles below this place, some few weeks ago, one young man of the party caught a monster snapping turtle, with a strip of brass securely fastened through a hole in the back part of the top shell. When removed and cleaned the following inscription was found upon it: "A. W. Cook—1866." This was the name of a prosperous farmer (long since dead) who lived only a short ways from where this fellow was caught.

A few years ago, while fishing in Spirit Lake, Iowa, I caught a croppy that weighed 2lbs. 2oz. Will some one of the many readers of FOREST AND STREAM state about how large croppies grow?

V. V. S.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

CHICAGO AND THE WEST.

Comparative Anatomy of Fish.

CHICAGO, Ill., Oct. 3.—This fall one day two Chicago gentlemen, Messrs. Jim Donnell and Charlie Jurnagin, were fishing for muscallonge up near State Line, Wis., and they had an awful strike and fought a tremendous muscallonge all over the country for an hour or two, the struggle being one worthy of an Iliad with two Homers and a full set of Siberian bloodhounds. At last they got the monster up to the boat and Mr. Jurnagin struck the gaff into its heaving sides, from which the rainbow spray was flying like suds in a laundry on Monday morning. The fish broke away with a mighty effort and escaped, with the gaff hook hanging in his side. The two fishermen looked at each other with pale faces and gasping breath, and then slowly wended their way back to camp. Conservative estimates placed the weight of the fish at not less than 40lbs., and it was thought to be one of the mossbacks which are so rarely seen nowadays. The next day two guides out on the lake found the fish, which had come ashore dead, with the gaff hook still fast to it. It weighed just 6½lbs., gaff hook and all.

Among the Anglers.

Gov. Wm. Pitt Kellogg, of Louisiana, passed through this city for his home in the South this fall, after a long trip to the grand fishing waters of Canada. The Governor is a hale and hearty-looking gentleman, with white hair and a clear eye, who appears good for many more trips to the woods.

Mr. Graham Harris has been having some late fly-fishing for bass, taking ten nice ones one day last week in the Kankakee river, near Davis, Ind. He used the scarlet-ibis.

Fishing Notes.

Muscallonge are biting the hard, glittering, unreal spoon hook up in Wisconsin this month, but no big fish have been taken and no number of small ones worth special mention. The Fox River west of town has been yielding some nice catches of small-mouth bass. Paul Bielenberg, of Elgin, last week got two small-mouths on the same day which are said to have crowded 5lbs. each very closely, and had four whose total was 16lbs.; certainly a very fine day's take.

Mr. C. W. Stansell has returned from a pleasant fishing trip with a yachting party of Detroit gentlemen who went out to the St. Clair Flats. They met not the best of wind and weather, but Mr. Stansell had thirty-seven small-mouths to his own rod in one day, which is good enough for anybody.

Richmond Rod and Gun Club.

Richmond Rod and Gun Club, of Richmond, Ind., are doing a notable work in stocking waters with the small-mouth black bass. Their fine club preserve is gradually coming to be well supplied with this admirable fish, owing to an intelligent selection and breeding of the fish. The water this club preserves is, as I understand it, tributary to the White River of Indiana, a famous bass water. It is the wish of the club that the U. S. Fish Commission should help them in their efforts to stock thoroughly the waters in question with the small-mouth bass. Surely the Commission might do worse than aid so worthy an enterprise, keeping meantime quite within its prescribed duties. The cars of the Commission pass not far from this region, and the club would probably not ask a contribution for private purposes alone. Mr. C. P. Holton is president of this active body of sportsmen, Mr. M. B. Craighead treasurer, and Mr. W. S. Iliff secretary. The membership holds strong at about thirty, and the club is something more than a trap-shooting body. The shooting clubs of the country can do a lot of good when they try.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

Salt-Water Fishing Near New York.

NEW YORK, Oct. 12.—The fishermen who frequent Sheepshead Bay and that vicinity are having their first good fishing since the fluke fishing early in the summer. The snappers, whose arrival everybody awaited with impatience, didn't arrive at all. The porgies, too, were very scarce. Nobody seems able to account for this state of affairs. Last season the snappers and porgies were very thick, and catches of fifty to 100 were not uncommon. On Labor Day of last year Will Fox and George Gatje caught 180 odd snappers and porgies, while on the same day this year Will Fox and myself got seven porgies.

But while the snappers and porgies proved disappointments, the blackfish and sea bass, especially the former, are doing nobly, from a fisherman's standpoint, and striped bass are being caught as they never were before in that vicinity. There are not many fish in the bay, but one can catch a good mess in a short time at the "stone pile," which I described in FOREST AND STREAM of Sept. 19 as being off the Oriental Hotel on Manhattan Beach, but which is really off the Manhattan Hotel.

John O'Neill, who keeps the boat house at Sheepshead, caught eighteen striped bass off Manhattan Beach last week. Most of these weighed from 3 to 6lbs., and one weighed 18lbs. This is the season's record striped bass for that vicinity, I believe. He uses blood worms for bait and trolls for the fish. Most of the fishing boats are put up for the winter. The owners report a profitable season despite the poor bluefishing.

The route to Sheepshead Bay is by trolley car from Brooklyn Bridge or ferries, or steam cars from Atlantic avenue depot.

G. F. DIEHL.

As They Esteem It.

MILWAUKEE, Wis.—Inclosed find check for renewal. This has been my first year with FOREST AND STREAM, and I never expect to try to do without it. I admire its sportsmanlike tone. C. P. S.

THOMPSONTOWN, Pa.—I desire to tender my thanks for the spotless purity of FOREST AND STREAM, free from anything coarse or bitter. Also for nice discrimination in selections for publication. T. S. T.

Game Laws in Brief.

THE *Game Laws in Brief*, current edition, sold everywhere, has new game and fish laws for more than thirty of the States. It covers the entire country, is carefully prepared, and gives all that shooters and anglers require. See advertisement.

FIELD TRIALS AND FIELD DOGS.

CONSIDERING the time, attention and money expended on the field trial dog, he has not won his way into the permanent good opinion of sportsmen, nor improved in his manner of doing the work required in field shooting. He has not come up to the sportsman's standard as he should have done, and as the sportsmen, whose interest and support make field trials possible, had a right to expect that he would do.

Aside from any consideration of hard times, the field trial dog as such has steadily lost ground in the opinion of most sportsmen who once supported him, and he has not added to the list of his admirers to any noteworthy degree. There is no sound reason why the field trial dog of the correct stamp should not be the accepted field dog of all sportsmen, one to delight them in actual shooting as well as being successful in competition.

There have been, however, some constant features of field trials which are repugnant to the sportsman's standard of a field dog. Bad breaking has been one of the most constant, for there is never an important trial held which has not dogs in it which are remarkably disobedient, or which require laborious effort, offensively loud continuous whistling and orders loudly shouted, all to keep them within reasonable bounds and all very much of an exhibition of how a dog should not be handled. Indeed, dogs which are practicably uncontrollable from the standpoint of what is required of a dog to give pleasure to a sportsman in every-day shooting are not so rare as one might think they are. There has been a kind of understanding that bad breaking was in some way useful in trials. Some trainers permit their dogs to be disobedient on the score that the opposing handler's whistle or the work of the opposing dog may not deter the partly broken dogs from getting all they can, though there have been suspicions that this plea has been advanced to cover up an imperfect and neglected training, and to make all training easier from the lower standard thus set.

However much such imperfect training may have been of use in field trials, and it was of use as a means to win money so long as field trial clubs and judges accepted it, the sportsman could only derive ill success and disappointment from it in actual shooting. Too often the imperfectly broken dog for field trials was not finished as he should be for field shooting. The fact that the dog had the stamp of field trial approval was set forth to the owner as proof of the dog's good training, so that the rule worked both ways and the both ways worked anyhow—the dog needed to be partly trained for field trial competition from a field trial view, and having run in a field trial he was all right to return to the owner as a dog for field shooting. Not only did the field trial dog fall into disfavor, but the field trial style of breaking likewise fell into disfavor, and very properly so.

The bad breaking, fostered so long by field trials, was not all. The wide-ranging dog, the dog of transcendent merit when he is really seeking birds and working to the gun, had many imitators and shams. Some dogs will range wide and appear to be seeking birds when in reality they are not, as a greyhound or a cur might be ranging wide and still have no thought of birds. The distinction between the wide ranger which was really seeking birds, and the wide ranger seeking amusement and exercise, was not properly observed. They were classed too much as being alike. In actual work afield the field trial estimate was worthless.

Again, an impossible style of speed was encouraged. Instead of the steady, trained, swinging gallop which denotes the dog of real working ability for all day or part of a day, a nervous slam-bang sort of speed, the overflow of restrained energies, the dog whose speed has been timed for an hour's sprinting and which not infrequently falls short of it, was fostered and established. Thus came about the hit-or-miss sort of dog work over which was thrown the glamour of style and dash, both of which seemed to transcend in merit the really useful instead of being subordinate to it.

As if all these things were not enough in themselves, some of the trainers made an invidious distinction between the field trial dog and the dog for field shooting, designating the latter as a "plug shooting dog," as if there was some stigma on the dog over which a gentleman could really shoot birds for no other reason than that such dog was useful to the gun. If field trials are to have a new support now that the commercial incentive is waning, it must be by returning to the principles of real usefulness for field work instead of a quick means of winning prizes.

That dogs can be well broken for field trial use, and handled quietly and skillfully when so broken, was demonstrated by Mr. Thos. Johnson, of Winnipeg, in the last Continental Club's field trials in Minnesota, and in several of the members' stakes in recent years, where the absence of shouting and the incessant tooting of the whistle was a pleasure to note. If owners would insist that their dogs be broken properly to obey orders and work to the gun, discarding all field trial excuses, they would have better trained dogs and field trials would be relieved of much that a field trial dog should not be.

ALABAMA AND FOX HUNTING.

HUNTSVILLE, Ala.—*Editor Forest and Stream:* Court adjourned here two weeks ago, and finding a few days' leisure I hied myself to the dear old County of Limestone to mingle with those congenial spirits and peerless gentlemen, Dr. Ike De Loney, J. W. Tillman, Clarence W. Spiers, Capt. W. N. Richardson, and a host of other magnificent men. Arriving at Athens at 12 o'clock P. M., after seven hours' rest I betook myself to the residence of Mr. Tillman, who greeted me with that incomparable cordiality peculiar to those who love the chase, and after the compliments of the day were exchanged we prepared to dine at Dr. De Loney's. Behind his smart roadsters, the drive of six miles through a hunting country that even pessimists must allow is splendid, the distance was lessened by his interesting conversation, and the thrilling manner of relating the incidents of a fox chase.

Arriving at the Doctor's residence, our coming was made known by the salute of some thirty hounds. Among the number I recognized the peculiar type of the strain worshiped by that prince of modern chevaliers, Wilford Ivanhoe Spiers, Esq., of Willis fame, and when that gentleman came out and extended his noble and honest hand my happiness was complete. Mr. Spiers had come up to visit Dr. De Loney and his nephew Clarence, and expected to jolt the foxes up and down the beautiful serpentine stream of Sevan Creek, but, the drought still being on, could do aught but hunt, jump and lose the fox.

"Say, boys," I said, "are there any foxes around here?"

"What are you talking about, John, Jr.? Don't you know foxes are thick in Limestone county?"

"I know, Wilford Ivanhoe! I never have been hunting in this section in my life, when favorable conditions of weather prevailed, and failed to start game."

"John, Jr., I'll tell you candidly, Clarence and I went hunting yesterday morning after that little shower, and started two foxes. That evening we ran another, and last night we had a chase that lasted until 12 o'clock."

Dr. De Loney then spoke up: "Gentlemen, I am of the sincere opinion that in a radius of five miles from where we sit there can be started fifty foxes. Just across Round Island Creek there are three dens, which at least would represent twelve foxes, and all of them are reds too."

The conversation then turned to the next meet of the Dixie Red Fox Club. I told the gentlemen of the large increase of members and of the interest manifested by the sporting fraternity in the welfare of the club, and called the names of many well-known hunters who had expressed their intention of attending our next meet. All present were extremely hopeful and confident that from the point of attendance our meet in December would eclipse our last, and any one familiar with the climate of north Alabama knows that the middle of December is always the most propitious season we have for hunting.

After partaking of a sumptuous and elegant spread Mr. Tillman and I bade our friends a fond adieu until the ides of December shall be thrilled and mellowed by the hunting horn.

At Athens the young men insisted on taking their old bachelor friend to see the ladies. And the women of old Athens, with the first bloom of youth tinting their dimpled cheeks, their magnificent Di Vernon beauty, flashing black eyes and flowing tresses, which can only be rivaled by their patrician lineage and the high culture bestowed on their minds, were glad to see me, and promised that on Friday night, Dec. 18, a leap year ball would be given at the City Hall, complimentary to the gallant knights of the horses and hounds who attend the meet in Dixie. May their immaculate lives be lengthened and may their ability to charm and entertain never be diminished!

JOHN, JR.

C. F. T. C. Trials.

INDIANAPOLIS, Ind., Oct. 10.—*Editor Forest and Stream:* I have just returned home from the South and have located the quail trials of the Continental F. T. Club at Tupelo, Miss., where I have secured 15,000 acres of the finest field trials grounds that I have ever seen. Mr. N. B. Nesbitt drew the grounds for me with champion Jingo, and although the conditions were not favorable, the dog found and pointed plenty of birds. There are as many birds at Tupelo as at any place in the South, while the grounds are of easy access, and the hotel and livery accommodations are ample and first-class, at reasonable prices. The hotel rates are $1.50 per day; double teams with driver, $2.50 per day; saddle horses, $1 per day. I found the citizens of Tupelo hospitable to a fault and anxious to have the trials at their town, they promising to do all in their power to make our stay pleasant and the trials a success. I am satisfied that they will keep their promise.

Mr. N. B. Nesbitt, of Chesterville, Miss., will take pleasure in locating in desirable places all handlers who write to him.

I desire to publicly return thanks to the citizens of Tupelo for the attention paid to me while there, and also to especially thank Mr. Nesbitt and Mr. J. N. Seale, superintendent of the Mobile & Ohio R. R., for courtesies extended.

I ordered posters printed while at Tupelo and the grounds will be posted at once. The time for holding the trials will be determined in a few days.

I see that I failed to mention Fishback & Baughan's black, white and tan English setter dog Vim Gladstone, by Gladstone's Boy out of Gath's Belle, in the list of Derby entries in the Continental Field Trials Club's quail trials. Please make correction. P. T. MADISON, Sec'y-Treas.

TECHNICAL TERMS.

Elbow out.—The elbow, it need hardly be said perhaps, is the joint at the top of the forearm. A dog is said to be "elbow out," or "out at elbows," when this joint, instead of being carried just free of the ribs, as it should be in a well-made dog, sticks outwardly. This may be the result of weakness in a young puppy; but in an adult dog, except in the case of the bull dog, in which it appears to be accepted, is a decided malformation.

Faking—Is the term used when a dog's natural appearance is dishonestly interfered with for the purpose of making it appear otherwise than it naturally is. For instance, dyeing white on a retriever's or Irish terrier's feet or chest, or coloring a Dudley nose, or performing an operation to make a fox terrier's ears fall correctly, and similar practices are called "faking." Trimming a dog's coat, such as the coat of a Bedlington or wire-haired fox terrier, is not, however, considered "faking." A dog is said to be "faked" when some illegitimate operation has been performed. A "fake" is the action taken.

Feather.—The fringe of hair on the legs, ears or tail of some breeds, such as setters and spaniels.

Felted.—When the hair of some long-hair breeds becomes matted through neglect it is said to be felted.

Filled-up.—A dog is said to be well "filled-up" below the eyes when there is no falling away or undue narrowing of the face at this point. The term is frequently used in describing terriers. A well "filled-up" face is a good point.

Flag.—A term for the tail; in use when describing setters and wavy or flat-coated retrievers.

Flews.—The chops or hanging upper lips of a dog; the bloodhound, for instance, has very pronounced flews.

Freckles.—The specks of color on the face and legs of some dogs, such as the spaniel.

Frill.—The fringe of hair on the chest of a dog; a marked feature of the collie.

Froggy-faced.—A term used in the case of the bull dog to denote a level-mouthed or overshot dog. A bull dog should be considerably under-shot; a "froggy-face" is therefore a bad point.

Furrow.—A deep line extending from the brow upward to nearly the occiput, in the bull dog.

Go-bye.—A term used in greyhound coursing. A "go-bye" is when one dog, starting a length behind another, passes him in the straight and gets a length in front.

Gooseberry-eyed.—Yellow-eyed.

Grin.—A dog is said to "grin" when the skin of upper and lower jaws do not meet in front, and so disclose the teeth.

Hare-footed.—See also *cat-footed.* A dog is said to be "hare-footed" when its feet are long, narrow and projecting in front, like the feet of the hare.

Hare-pied.—A color; hare-color and white; fairly common in beagles.

Harlequin.—A harlequin dog is one colored with large or small spots of black, gray, liver or red on a white ground. Harlequin Great Danes are not uncommon.

Haw.—The red inner eyelid of the dog; generally hidden, but very prominent in the bloodhound, and to a less extent in the St. Bernard, otterhound and old Southern hound.

Huckle-bones.—The tops of the hip-joints.

Kinks—Are congenital dislocations in the joints of the tail, very commonly seen in the tails of bull dogs.

Kissing spots.—The tan spots on the faces of Black and Tan dogs, such as the Manchester terrier, King Charles spaniel and others. The moles on the cheeks of the pug are also sometimes called "kissing spots."

Landseer-Newfoundland.—The black and white Newfoundland.

Lay-back.—A term used in bull dogs to denote the facial angle, or the slope back from the under jaw.

Leather.—The skin; a term especially applied to the skin of the ear. Thus, an ear is said to be thin in leather.

Level-jawed—Signifies when a dog's teeth meet properly, and the jaws are neither over nor under shot.

Lippy.—A term which is generally applied to a dog with hanging lips, of a tight-lipped breed, such as, for instance, a bull terrier. The term is therefore not a compliment.

Mane.—The heavy coating on the neck and shoulders of some dogs, such as the collie and the schipperke.

Monkey-faced.—A term used in bull dogs when there is not sufficient depth through the muzzle.

Occipit.—The prominent bone at the back of the skull; particularly noticeable in the bloodhound.

Over-shot.—A term applied when the upper teeth project beyond the lower. A fault in any dog.

Pear-shaped.—This has already been described under the head of "Chippendale." It signifies that a dog's chest, viewed from the front, is very wide; and below the chest the legs curve in toward the pasterns to form what is called a "pear-shaped" front. The "pear shape" is more or less out of fashion in bull dogs at present, but at one time it was a much admired point.

Pencil-marks.—The black marks on the toes of the Manchester terrier. A point of beauty.

Pily.—A quality of coat consisting of a short, woolly growth next the skin, through which grows the longer, coarser hair which is visible, such as the coat of the Dandie Dinmont terrier.

Pinched-faced.—A term used in bull dogs when the face is not sufficiently broad in proportion to the width of the skull.

Pin-wire.—A term descriptive of the hard, wiry coats of some wire-haired terriers.

Pig-jawed.—When the upper teeth project beyond the lower. An overshot jaw in a pronounced form.

Ring-tailed—Signifies when the tail curls into a ring at the end.

Roach-backed—Means when the back rises from behind the shoulders in a curve, which reaches its summit at the loins and then falls away again to the stern. This form of back, called roach or wheel, is the correct shaped back of the bull dog.

Rose-ear.—The form of ear which folds at the back, turning backward and downward, and showing the inside of the ear, as the ear of the bull dog and greyhound.

Rump-high—Is when the back curves up from the shoulders, as in the case of a "roach-back," but does not fall away again from loin to stern. "Rump-high" or "stern-high" is considered a bad point in the bull dog.

Self-colored.—A "self-colored" dog is one that has no black shadings or white markings, but is one uniform color. It is an objectionable point in the St. Bernard.

Septum.—The division between the nostrils.

Snipy.—Denoting a long, narrow muzzle, falling away below the eyes. A "snipy" face is the reverse of a face "well filled up" below the eyes.

Splay-foot.—A foot that spreads out flat, with the toes well separated. An undesirable form of foot in any dog.

Stern.—The tail.

Stern-high.—See rump-high.

Stifle joint.—The hip-joint.

Sting.—A tail is said to be "sting-like" when it tapers to a fine point, like the tail of the pointer.

Stocky.—A bitch is said to be "stocky" when she appears likely to be a good breeder. The term is not always confined to bitches; a strongly-built, lusty dog may also be said to be "stocky."

Stop.—The hollow or indentation between the eyes of some breeds of dogs, such as the bull dog, the pug and the King Charles spaniel.

Thumb-mark.—A dark mark above the forefoot of the Manchester Black and Tan terrier; like the "pencil marks," a point of beauty.

Throatiness.—A certain looseness of the skin of the throat, not necessarily amounting to pronounced dewlap.

Tick.—Small flecks of color in the white coat of a dog; common in spaniels and setters, and not rare in fox terriers and other breeds.

Tiger-dog.—See Harlequin.

Tight-lipped.—A dog is said to be "tight-lipped" when it is free from lippiness or flews, as the bull terrier, the white English terrier and the Manchester.

Trip.—A term in greyhound coursing, and signifies when a dog gets hold of the hare, but fails to kill.

Tulip-ear.—An erect, upright or pricked ear like that of the Scottish terrier.

Turn.—A term in coursing, and means when the hare is turned at an angle, not less than a right angle, from her course.

Twisted-jawed.—A dog is said to be "twisted-jawed" when the lower jaw has the appearance of being distorted. The deformity is peculiar to the bull dog; it does not exist in the bone of the jaw, but merely in the soft structures, and is due to congenital injury.

Under-shot.—A dog is said to be "under-shot" when the lower jaw projects beyond the upper, as in the bull dog.

Up-turn.—See "lay-back."

Well broken-up.—A term used to express the loose and wrinkled skin on the face of the bull dog.

Wheel-back.—See "roach-back."

Wrench.—A term in coursing, signifying when the hare has been turned at less than a right angle from her course.

Wry-faced.—See "twisted-jawed."—*John Brown in the Asian Sporting Newspaper.*

Western Massachusetts Fox Club.

THE Western Massachusetts Fox Club contemplate holding their ninth annual hunt Nov. 11 and 12. It is expected to make this gathering the most enjoyable of any thus far. With genial George W. Roraback at the head, nothing will be lacking for those participating in the forthcoming hunt to have an exceedingly pleasant time, providing the weather is more conciliatory than in the past three seasons, which have been handicapped by decidedly unpleasant weather, which interfered very much with the pleasure of those gatherings.

As usual the hunt will occur on Wednesday and Thursday, affording those who come from abroad sufficient time to come, participate and return home in the same week.

The reputation the club has gained in the past for its cordiality, good cheer and its splendid hunting facilities is well known to nearby fox hunters and others who have attended the past gatherings of the club. To all interested in fox hunting I can safely bespeak a hearty welcome. They will find the latch string ever ready to respond to their demands.

I have every reason to believe that every one who participates in the hunt this season will ever refer to it with feelings of gratification and pleasure. WORONOCO.

Eastern Field Trials Club.

GREENFIELD HILL, Conn., Oct. 10.—*Editor Forest and Stream:* The Eastern Field Trials Club's eighteenth annual field trials will begin at Newton, N. C., Nov. 13, with a sweepstake for pointers and setters owned by members of the Eastern and Philadelphia Field Trials Clubs.

Dr. J. Spencer Brown, member of E. F. T. C., has donated a valuable oil painting, value $100, to be awarded to the winner of the stake.

The Derby stake will begin Monday, Nov. 16.

The entries closed June 15 with twenty-eight setters and twenty-one pointers entered; of these entries six setters and five pointers dropped from the list Sept. 1, leaving sixteen pointers and twenty-two setters to compete for Derby honors.

The prospects for a good meeting at Newton are very encouraging. Handlers report birds plentiful, dogs doing good work, and with such desire as is known to exist for field trial honors the sportsmen of this country may expect to see a grand exhibition of field work.

All dogs entered in the Eastern or United States will be returned free of charge.

Further details of the meeting will be given you next week. S. C. BRADLEY, Sec'y.

Central Beagle Club.

SHARPSBURG, Pa., Oct 12.—*Editor Forest and Stream:* The Central Beagle Club's headquarters during their first annual trials will be at the Downey House, Waynesburg, Pa. Special rates have been secured, and also good places for the dogs. Trains for Waynesburg leave Pittsburg, Union Station, on the P. C. C. & St. Louis R. R. at 7:30 A. M. and 2:55 P. M., city time, arriving at Waynesburg 10:45 A. M. and 7:00 P. M. The annual meeting will be held on Tuesday evening, Nov. 10. The drawing will take place on the evening of the 9th. Entries close on the 20th of this month. L. O. SEIDEL.

In response to the call for a meeting of the Bull Terrier Club, to be held in the A. K. C. rooms on Monday of this week, but three members responded, namely, Dr. R. S. Huidekoper, Messrs. James Mortimer and F. F. Dole, and as there was no quorum present no meeting was held.

KENNEL NOTES.

Kennel Notes are inserted without charge; and blanks (furnished free) will be sent to any address. Prepared Blanks sent free on application.

WHELPS.

Rochdale Kennels'

Marton II., fox terrier bitch, whelped, Sept. 26, three bitches, by Stipendiary II.

Rochdale Starlight, fox terrier bitch, whelped, Oct. 2, four (one dog), by Stipendiary II.

Wheeling.

Communications for this department are requested. Anything on the bicycle in its relation to the sportsman is particularly desirable.

THE BICYCLE IN CHICAGO.

CHICAGO is one of the greatest bicycle towns in the United States or in the world. If the amount of capital invested in the bicycle trade in this city were carefully estimated, it might be found that no city in this country has so much claim to be called the greatest bicycle town, for there are centralized here for a large part of the West a number of factories which would be distributed over an entire State in the East, where manufacturing points are scattered more widely. At any event, it is certain that this city has an enormous number of factories and shops which make wheels, parts of wheels or sundries connected with the wheel. The distributing trade of the city is enormous beyond easy comprehension, and the retail trade bears its own proportion of the big figures of the wheel trade. It is literally true that not enough stores could be rented this spring in the central part of the Chicago business section to accommodate the firms wishing to sell and display bicycles. It is not an unusual thing to-day, even after these matters have more or less adjusted themselves, to see bicycles displayed in the windows of tailor shops, boot and shoe stores, furnishing goods places, etc. Add to these sales places the number of concerns offering in their windows bicycles as prizes, premiums or guessing contest incentives, and the result would convince the most casual street observer that the wheel was in the plans of all Chicago and had come to stay.

The vogue of the wheel in Chicago is entirely a natural affair. It is a natural wheeling town, and has about it a natural wheeling country. Chicago does not lie upon a long and narrow island, as does the great city of New York, but has room to spread in every direction, so that the congestion of traffic will never be so intense as in New York. The wheelman of the latter city has a serious time ahead of him when he undertakes a spin out into the country, and the wheelman of many much smaller cities has a still more serious time. The crowded city streets are no place to ride, and that city is most fortunate, from a wheeling standpoint, which makes it possible for the rider to get out upon the boulevards and roads with the least loss of time.

The FOREST AND STREAM office in Chicago is located almost exactly in the center of the business district of Chicago. Here, as all over the greater portion of the city, the streets run at right angles, and here, as all over the city and for twenty miles around it, the ground is absolutely level. From the FOREST AND STREAM office one only needs to ride across the river—about six blocks—to reach the head of Washington boulevard, along which he can ride into many pretty suburbs. Following the well-known Aurora century course, he can ride on out twenty, twenty-five or thirty miles over streets that are practically boulevarded or paved, for all that country is practically Chicago. He can get out to Wheaton, Glen Ellyn, and many other beautiful places, and by the time he is that far out he will be in a land of black dirt and many wet bogs and sloughs, where very good jacksnipe shooting is often had. He can swing to the northwest more and get into another good snipe and plover ground with equal ease.

Starting from the FOREST AND STREAM office, in the center of the city, the rider can cross the river to the North Side by a ride of about a quarter of a mile, where he then strikes a series of paved streets which will take him in a few blocks directly upon the Lincoln Park boulevards. He can ride through that park and on north along the lovely lake shore boulevards until he strikes the famous Sheridan road, one of the great bicycle ways of the entire world. He can follow this fine boulevard to its end and strike pavement and macadam for miles on out, and so come to Fort Sheridan, Lake Forest, Lake Bluff, Waukegan, Racine, and any number of a whole string of towns which lie along the side of blue Lake Michigan. This is a good direction to take for a ride out of Chicago. It also brings one into a possible shooting country. Some of the best snipe grounds near Chicago are along the little prairie sloughs west of Glencoe, and there are one or two spots not far west of Evanston where very often nice bags of woodcock are made by shooters of those suburbs. Along this northern run the native forest still stands, and there are at spots well north some steep and picturesque hills. One of these is so steep and winding and dangerous that the local authorities have forbidden bicyclists to coast it. Two men have been killed there this season, and a great many serious accidents have occurred there.

Starting again at the FOREST AND STREAM office, one can within three blocks get to Michigan avenue, one of the great boulevards of the world. This is the best place to see the swell riders of Chicago. This boulevard leads straight south, into the residence part of town, and spreads out into several others—Grand, Drexel, etc.—all arriving at the great South Park system, one of the show grounds of Chicago, and in no way less than in the display of bicycles and riders. Thence it is but a step to Jackson Park, the site of the World's Fair grounds, and the course is directly along the famous Midway, which now shows no sign of its former riotous tenancy, but is smooth as a billiard table. Still further south the smooth streets and roads go, macadamized and rolled and paved for miles and miles, to the bathing beaches and other places of enjoyment below the city. Here the shooter who is also a wheelman is close to the marshes of the once famous Calumet Lake, whose glories have now departed. If he be careful, he can once in a while get a good day with the snipe in the wet swales not far from here.

If he swing to the right at Washington Park, turning over on Garfield boulevard for a way, and thence riding

south through the edge of Englewood into Auburn Park, he is on the edge of a snipe marsh on which hundreds of snipe are killed every year. Here are located the shooting grounds of the Eureka Gun Club. A great many of the attendants at the fine weekly shoots of the Eureka Club come to the shoot on their own wheels, and one sometimes sees two or three dozen wheels piled about at a meeting. At Watson's shooting park also, which lies over toward the lake from the Eureka grounds, but easily accessible by means of the electric car tracks, which make a fair bicycle road, one very often sees a great many wheels on hand at a shoot. This is off the regular nickel-plated boulevard system of the park runs, but is not difficult for a rider who can do fifteen or twenty miles without grumbling at a loose paving block or two.

Starting again at the FOREST AND STREAM office, one is eight blocks from Jackson street bridge, from which it is only a step to the fine Jackson boulevard. This opens up yet another way out into the country and connects with another series of boulevards, Twelfth street, Ashland, etc., etc. Here one may ride out into Douglas Park, and thence cross over along the boulevards to Garfield Park. Here he can take Washington boulevard, or go on north to Humboldt Park and Humboldt boulevard. Riding a few cross streets, mostly of cedar block, he can get over to the Lincoln Park system, and strike the Sheridan road above mentioned; or if he does not care to turn toward Garfield Park when he leaves Douglas Park, he can follow on out along Western avenue and presently strike the Garfield boulevard, along which he can ride a few miles and come out upon the South Park and Michigan boulevard systems. Of course, the lake lies on the east side of Chicago, the heart of the business district being only two blocks from the water front, so that no riding can be done in that direction; but by reference to the above it will be observed that all the great boulevard systems of Chicago, to the north, the west and the south, are practically connected. One can ride on the smooth asphalt and rolled boulevards for something like fifty miles, I should say, thus skirting the edge of the thickly settled parts of the city, though he will find fine residences and practically city life many miles further out than his furthest point of such travel. It is said that no city in the country has so fine a boulevard system as Chicago, and from the above it may be seen how singularly easy of access these systems are to the rider starting from even the very business center of the town. The three great boulevard series of the city—of the north, south and west sides of town—are separated in the down-town portion by an ugly strip of some eight or ten blocks of rough granite pavements. The best way to get across from the west side to the south side is over Jackson street bridge. The allied forces of the Chicago bicyclists are beseeching the city council to set aside Jackson street and boulevard it, reserving it for the use of the carriages and bicycles alone. It is very likely that this will be done. Then indeed Chicago will be the luckiest city in the world so far as bicycle riding is concerned.

So perfect are the surfaces of these Chicago boulevards, and so absolutely level, that after a little while the rider, at least the athletic rider, tires of them. It is absolutely no exercise to ride along such roads. But it may be seen that they lead at once directly to the country roads. Along these the lover of the rod and of the gun may ride with purposes not consecrated to the wheel alone. In other words, he can make of the bicycle what it should be and what it will be, a vehicle, and not a toy. This is the future of the bicycle, and here lies the surest foundation for the permanancy of the bicycle trade. People tire of toys, but they will always use the best and readiest and cheapest vehicle. They will not let go of a vehicle which gives them sport, offers competitive athletics and takes them out of doors. The Chicago shooter or angler who goes on his wheel to the Fox River or to the snipe meadows twenty miles from town would not go if it were not that he could ride there. He would not pay a liveryman $4 for a team to take him there. But since he can step into the saddle at no expense and no loss of time, he does go, and he walks and is out in the fresh air a whole day, to say nothing of the exercise he has from the wheel. Therefore he is just one day ahead in life. He has been out of doors, whereas otherwise he might have been in a room, breathing city air, which men endure, but which never did any man any good as compared to the air of the country. E. HOUGH.

1206 BOYCE BUILDING, Chicago.

Military Wheelmen.

THE English *Illustrated Sporting and Dramatic News* of Aug. 29 has a picture of the 26th Middlesex Cycling Volunteers uniformed and equipped for the field. This corps was raised in February, 1888, and numbers 118 effectives out of an authorized strength of 121. They are armed at present with the Martini-Henri rifle, but hope soon to exchange this for the magazine rifle, as the latter has the advantage of a shorter bayonet, which is less apt to catch in the spokes of the wheel. The rifle and a hundred spare rounds of ammunition are carried in the bicycle. The "Lintot equipment," whatever that may be, has been adopted, and is found to answer well. If this has to do with the manner of carrying the rifle, the equipment apparently consists of a large leather-wrapped ring permanently attached to the head-post, into which the muzzle of the rifle is inserted, and a U-shaped device on the rear fork which catches the rifle at the grip. The rifles are carried on either right or left side of the wheel, and hang as a rule some distance below the upper brace tube, top uppermost. The officers are armed with sword and revolver carried on the machine.

These cycling volunteers are daring riders. In their recent evolutions at the Volunteer tournament in the Crystal Palace they picked up and rescued wounded men and performed other similar feats.

They carry their bugler into action sitting on one of their members' shoulders, with his feet on the handle bars.

As Regards Comfort.

THERE is a pronounced reaction from the racing models of bicycles toward more sensible road wheels. Brakes will be more in evidence next year than they have been for a number of years, and we may expect to see many other improvements designed for safety and comfort. Willis Troy, who is back in this country after a trip to France as manager of a racing team, is reported as saying:

"Many riders will yet buy 25 or 28 or even 30lb. wheels, fitted with stronger and more expensive tires, gear cases, brakes, and everything necessary for comfort and safety. Where the ball bearings and the various parts of a wheel are made and adjusted properly, road riders will get far more satisfaction out of a 30lb. wheel than out of one weighing much less. In England a few years ago the bicycle market was in precisely the same condition that it occupies here to-day, but it readjusted itself and good wheels over there again bring top prices."

Regarding tires *Bearings* says:

"The days of the shoestring tire are numbered, and next year will see the big tire in use—not universally, but here and there—and the leaven will work to the end that within another year 2in. pneumatics will be as common as the small tires which are fitted to-day. 2½in. tires were ridden by the winner of the Chicago road race on Labor Day, and although the condition of the roads was bad, and the rider a man out of training, he covered his 100 miles in a trifle over seven hours. The same rider, under the same conditions, could not ride the course in that time with 1½in. tires, and it is pretty certain that the winner of the time prize in this race could have lowered his mark with the big tires as an aid. Several men have tried the machines refered to, and although it is 2 or 3lbs. heavier than the usual run of light roadsters, they say it handles well and is fast on all kinds of surfaces. Car tracks are not noticeable, and rough cedar blocks become as asphalt. The tires are even easier to the feel on macadam than small pneumatics, and seem quite as fast. It is an open question if they are not even faster for track work than a small tire, granting, of course, that the tread and side walls are of the same thickness. The tires which we have seen are single tubes, of the road-racing weight, and are made for 26in. rims, holding the rider about the same distance from the ground as a 28 by 1½in. tire."

Regarding gear cases the same authority says:

"A gear case provides for a protection of the lubricant covered chain and sprockets, and contributes more to the comfort of the rider and the life of the machine than any attachment which could be added to our American wheels."

The Mather Wheelmen.

NEW YORK, Oct. 7.—*Editor Forest and Stream:* I beg to assure Mr. Mather that if any member of the club pronounces the name in any other way except with the "a" as in "father" or "mat" he shall be immediately requested to get out until he has learned to pronounce it properly. I hope that this will overcome all of Mr. Mather's scruples and that he will now consent "to sit on the fence and review the parade." The Mather Wheelmen are going to do their namesake proud, and he shall hear from us yet in a way that will not make him regret that he is our godfather; and I as the captain wish to say that Mr. Fred Mather has and always will have a warm spot in the hearts of the MATHER WHEELMEN.

Comments.

BROOKLAND, D. C., Oct. 4.—*Editor Forest and Stream:* In your issue of the 3d inst. I notice that you speak of the cactus as being a detriment to hunting the antelope on a bicycle. In reply would like to state, there are various tires manufactured now which are perfectly impervious to cactus or any other thorn, or even glass and nails. One of them is a single tube made wholly of rubber and fabric, and is very light.

Just a few words in conclusion. It is a pretty hard matter to ride a wheel on the ice, as I have found by experience. The least turn or wobble will send the rider sprawling. Last, but not least, it is next to impossible to mount by one's self on the ice. A. W. RIDGWAY.

Dog, Wheel and Rabbit.

IN the absence of live rabbits the Presidio Club inaugurated a new sport which is quite likely to supersede the original game. It is the running of a stuffed hare by the dogs. To do this an inverted bicycle with the tire off one of the wheels was located at one end of the field. A string, wound around the tireless wheel, stretched 125 yards off, where it was tied to a stuffed hare. The "winder" or wheelman waited for the signal and began turning the wheel so as to haul in the string and the rabbit, which the dogs tried to overtake. In one instance only did the terriers reach the game.—*San Francisco Call.*

Yachting.

THE last serious agitation of the measurement question was in 1889, the first season of the 40ft. class, when the FOREST AND STREAM, with the aid of a number of experienced yachtsmen, made a hard fight for a change of the then universal classification by waterline length to the present basis of racing length. Though excellent reasons were advanced in favor of the proposed change, it was opposed, as other progressive movements had been before, by some influential yachtsmen; some of the then prominent Eastern yachtsmen were very strongly against it, as was Mr. Burgess; and nearly all of the daily papers of New York and Boston were with them.

On account of this opposition, the matter was dropped for a time, but since then it has come forward of itself; without serious effort on the part of those who first opposed it, the opposition has dwindled away, and the change has been made, with only good results; none of those dire calamities predicted in the event of its adoption having thus far presented themselves after several years' trial.

The conditions which prevailed in 1889 are materially altered now, and for the worse; the demand on the part of a few for extreme speed at any cost has introduced the bulb-fin, the shallow hull and a construction that is both costly and lacking in durability. The present movement, in its several different forms, is directed primarily to the correction of these salient evils and the production of yachts of more moderate draft and sail area, added displacement and greater durability. To this general end several means are proposed, the simplest being the placing of certain arbitrary limitations on draft and sail in each class, and ranging from this up to the construction of a new formula, in which shall appear such factors as draft, depth, displacement, area of midship section, etc. This is the same task that has been twice attempted of late years by some of the ablest and brightest of British yachtsmen and designers, with a lack of success that is very close to an utter failure; and we have no very strong hopes that American yachtsmen will succeed in finding any one formula which will attain the end in view and bring back, in connection with some modern improvements, the generally usable yachts that made the racing in the old 70ft. and 40ft classes.

From the discussions we have heard thus far, we believe that the clubs concerned in the work are now ready to answer definitely the question that has been almost invariably evaded, as by the British Y. R. A. for years, but which is the foundation of a successful movement for a good measurement rule. "What do the clubs want? Speed without regard to cost, safety and similar wholesome requirements, or an average of good qualities in which speed, even if the first, shall not overshadow all others?" With Defender rusting at her moorings, with Wasp sailing alone for year after year in the smaller division of ths single-stick class, with Amorita and Quissetta plowing deep ditches in the bottom of the regular Sound racing courses, and with the comparatively wholesome 15-footers of 1895 completely outclassed by Glencairn and Sothis, we believe that the clubs, the racing owners, and yachtsmen at large would now not only accept, but welcome a rule that, even though it clipped off some seconds per mile as compared with the bulb fin racing machine, would produce certain types in the various classes which would be of durable construction, of practicable draft, reasonable accommodation, and above all, which could not be outbuilt in their first season by the mere use of greater draft and sail area on the part of newer adversaries.

In the one large class in which the America's Cup races have been held for some years the attempt to introduce the slightest restriction on speed would be at once strenuously opposed; but this matters not at all, as the class has no place in the regular interclub racing, and only comes into existence at odd intervals, it need in no way be considered in discussing a change of the rules. In all the other classes, of both rigs, there seems to be an opinion that unhampered experiment in draft, in sail area and in light and costly construction has finally outrun the natural limit, and that little or nothing is to be gained by continuing to seek further extremes. The experiment of Defender, for instance, has been most interesting and instructive, showing the possibilities of the great keel cutter, long a matter of dispute. The yacht is, however, so obviously useless for general yachting and racing that there is no room for argument over the demerits of the type. It would be a decided gain to American yachting if, from the knowledge gained in the experiments with Defender, Vigilant, Colonia, Volunteer, Lasca and Emerald, under one or two masts, the schooners of the 95ft. racing length class, the old 90ft., could be limited to an extreme draft of not over 14ft. This, of course, would mean a discrimination in favor of the centerboard type, but a long experience has shown that, even though a little slower in racing, this is by all means the most desirable type for Sound racing and the 'longshore work between Sandy Hook and Bar Harbor, about all that is required of these yachts.

In the smaller class of schooners the conditions call for a centerboard craft, and one of moderate draft, as in all ways most desirable; it is easy to see that about Long Island Sound a Quickstep of 7ft. draft is a far better yacht than an Amorita or Quissetta, of about the same accommodation, with 11 to 13ft.

In the single-stick classes from 36 to 75ft. racing length everything points to the keel type as the most desirable, both in speed and accommodation; and it is important that while extreme draft, such as nearly 10ft. in a 42-footer, should be prevented, the keel and centerboard be placed as nearly as possible upon equal terms.

In the classes from 25ft. downward there is little need of considering the question of internal space and accommodation; the shoal hull is permissible and the bulb-fin must be recognized, but at the same time some limitations to extreme draft and sail area are imperative.

Even though a suitable rule be found for the decked yachts in the classes from 30ft. upward, it by no means follows that the same rule will apply to the smaller classes with a larger ratio of live ballast, and it is possible that an entirely different rule may be found necessary.

THERE is some encouragement for next season in the fact that four new racing boats are already ordered, and that too in the same class. What is still better is the fact that the class is a good one, and there is reason to hope that the new yachts may be less of the machine type than any that have lately been seen. The 51ft. racing length class, to which the boats will belong, is the legitimate successor of the old 40ft. length class, and will show a longer hull of about the same beam, and a smaller sail plan than the racing forties of 1889–90. Just what the draft will be is dependent on the action of the clubs, in fact the proposed action on the rule, if any immediate results are reached, will have much to do with the shaping of the class; but the main idea seems to be to produce a fast racing yacht of moderate form and sail area, and of sufficient accommodation for owner and crew through the season. Two of these yachts will be designed by Gardner & Cox, one for F. M. Hoyt, owner of Norota, who has just sold her to D. B. Burnham, of Oyster Bay. A third will be designed and built by the Herreshoff Manufacturing Co., and a fourth, for J. B. Mills, late owner of Infanta, will be designed by Will Fife, Jr. The certainty of these boats in the racing is likely to bring out others before the season begins.

THE question of the meaning of the "mutual agreement clause" in the new deed of gift is revived by a proposal on the part of Sir George Newnes to challenge for the America's Cup, which proposal the Royal London Y. C. has declined to forward on the ground that it had no reason to alter the position which it took when the deed was first made public in 1887. In this the Royal London Y. C. sets an example in consistency and self respect that is in bold contrast to that of the Royal Yacht Squadron a little more than a year ago When the first copies of the new deed were received by these two clubs, each took much the same grounds as previously taken by the FOREST AND STREAM, substantially that the tampering with a trust was in itself illegal; that the manner in which the change was made was also illegal and contrary to club usage; and that the specific demands of the deed were unfair to all other clubs and contrary to the expressed intentions of the original donors.

After nine years of constant controversy, we have seen nothing to induce us to change the opinion which we expressed the week after the new deed appeared; while in the meantime some of the most objectionable points, such as the demand for the dimensions, have been disclaimed by the men who made them, and generally condemned as unfair by yachtsmen who at first defended them. In the effort to

repair the hasty and foolish work of 1887, an attempt has been made to place upon the clause mentioned an interpretation which is contrary to common sense and directly contradicted by the whole history of the three deeds and of the various negotiations between defender and challengers.

The mutual agreement clause must be interpreted in one of two ways: either as referring—as we have always claimed—to the immediate details of the races, after a challenge has been tendered and the dimensions of the challenger have been filed with the holder, or else as applying to all conditions of the possession, challenging and racing for the Cup. If this latter construction be the correct one, as now urged by those who made the deed, all its elaborate restrictions are as useless and unmeaning as the legal verbiage in which they are enveloped, and any future holder of the Cup may put it up for a race of 15-footers. In this connection Sir George Newnes's opinion of the new deed is important; he says, "The deed of gift can be altered yearly if the New York Yacht Club pleases."

If the new deed was bad in 1887 and 1889—and we believe that both the Squadron and the Royal London Y. C. stated the case very mildly in their condemnation—it was not a whit better in 1893, after the silly device of the mutual agreement had been arranged to quiet the scruples of the Squadron. The Royal London Y. C has done well to profit by the misfortunes of its fellow, as the cases are very similar. Like Sir George Newnes, Lord Dunraven was a novice in yachting, knowing nothing of its laws and usages, in utter ignorance of the history of the America's Cup, of the long struggle against the unfair conditions on which it was held, or the way in which those conditions had only recently been made worse for the challenger. The result, both to Lord Dunraven and to the Squadron, is enough to deter any club from fostering a challenge from a non-yachtsman and under the new deed.

As to Sir George Newnes, we know nothing save that he is one of the comparatively few men who can afford the luxury of racing for the America's Cup; he may be a good sportsman and he may make a good yachtsman; but for a task like this, requiring to-day the highest technical skill in yachting, joined to much good sense and diplomacy, we should like to see only a man of reputation in the yachting world.

THERE is one very important matter to be settled by the holder of the Cup before it accepts another challenge: that the challenging club shall give an ample voucher for the standing of its representative. It is not fitting that the holder should be compelled to ask who or what the challenger is; but the responsibility for all of his actions must be assumed by the club which not merely forwards but indorses his challenge. In the case of Lord Dunraven the Royal Yacht Squadron was able to escape all responsibility for his actions as the representative of the club, and the very unpleasant task of dealing with him was thrown upon the New York Y. C.

Without reference to this special case, it will be seen that it is only in accordance with the usage in all sporting clubs that the individual contestant should be known personally only to the club he represents. The contest is in no sense individual, but between two clubs, and each tacitly guarantees that his representative shall be in all respects a proper party, and in the event of any failure of the representative, the club must assume the responsibility of atoning for him.

This matter has never come up before in connection with the America's Cup, the long series of squabbles with the late Mr. Ashbury were very different from the case of Lord Dunraven; but now that attention has been called to the matter, it must be made a part of a distinct understanding in any future challenge.

ONE of the details of Sir George Newnes's proposal, which, by the way, he has not abandoned, but will keep in reserve, is that the races be sailed off Halifax. However grateful such a change might be to Lord Dunraven and some of his American friends as a vindication of their efforts to take the races away from Sandy Hook, the proposal is too absurd to call for serious discussion.

THE committee of the Royal Canadian Y. C. having in charge Com. Berriman's challenge for next year has notified him that the club is unwilling to accept a challenge from a yacht of the proposed size, the reasons being, as given last spring, that such a yacht would be of no use save for this special series of races. In accordance with this decision, Com. Berriman has decided to build in the regular 42ft. class. The new yacht will be designed by Poeckel and built by the Racine Boat Manufacturing Co.

IT is reported that W. K. Vanderbilt, the principal owner of Defender, will not sell her for conversion to a schooner, but that she will be kept under the cutter rig for service in case of a challenge at any time.

DURING the hurry and bustle of the racing season it has been impossible to continue from week to week the series of articles on Yacht Designing which were begun last winter. In answer to many inquiries we may say that we shall resume the publication of the articles very shortly; just at present we have in hand several more designs of modern yachts, such as those of El Heirie and Ethelwynn, which must appear first.

IT now seems probable that the 20ft. class will be adopted in several localities to supersede a larger and more expensive class with crews of six to ten men. The expense of racing these latter boats is in itself no small objection to many, and apart from that is the serious difficulty of getting and keeping together a properly trained racing crew, and the uselessness of the boats for pleasure sailing when not racing. With the modern 20-footer and a crew of three, many of these difficulties disappear, the racing is quite as keen and the speed as great.

We note with regret in the discussion of the new class a disposition to adhere to the obsolete and incorrect term, "one-rater," just as the 15-footers are frequently termed "half-raters." There is no good reason whatever for applying the English term to an American yacht when it does not fit in any way; not only has the rating rule been abolished, but even if in existence the yachts of the 20ft. class would not measure to one-rating, nor would the 15-footers measure to one-half rating. Even the few yachts of these rating classes imported from England have been canvased out of their home classes after arriving in America. The new boats are in no sense "raters," and it is a foolish affectation to call them so; let them have their proper names, as 20-footers or 15-footers.

The case is entirely different in another instance, that of cutter and sloop. For some years the sloop rig has been obsolete in America on all yachts of over 30ft.; it is found to-day only on the special 30-footers, the special 21-footers, the 20 and 15-footers and yachts of the older types of 30ft. downward. Not only all of the Cup defenders, but all smaller single-stickers, old and new, have been rigged as cutters, and should be classed as such. So far from this being the case, even the largest clubs continue to class such yachts as Queen Mab, Uvira, Jessica and Minerva as sloops, apparently for no better reason than that they are not schooners. It is not a little absurd and confusing to see these yachts, or even such cutters as Wasp, Gloriana and Gossoon, regularly classed as sloops.

A BROKEN TILLER.

WHEN the little Roamer came into existence she was looked upon by few friendly eyes. She was born amid the turmoil of a fierce yacht designing controversy, for it was in the early 80s when she first slid into her natural elements—back in that time when, gallant and alone, the FOREST AND STREAM stood boldly forth and championed the principles of scientific design.

This was the time when the brilliant but unfortunate C. P. Kunhardt was even slandered by some opponents, who were as weak in argument as they were strong in abuse, and for no other reason than that this powerful writer expressed his honest convictions. His opponents were blind to sound scientific ideas on yacht building. Theirs was blindness in its very worst form; they would not see.

Inch by inch, step by step, was the battle fought; surely it was a mighty battle too. It was the cause of the first adoption of those features which thorough trial has long since demonstrated to be correct, the lead keel and full cutter rig first introduced to the American yachting public by the FOREST AND STREAM. They have been the direct means of preserving to this country, on five different occasions, the much coveted America's Cup.

Arrayed against the FOREST AND STREAM, in this great fight, were what may properly be termed the hysterical forces of a patriotic delusion. These forces were composed of a mixture of sharpie and other shallow, centerboard "death-trap" advocates, who innocently imagined that the centerboard was an American something that must not be attacked, even though lives might be saved by introducing better ideas. These persons were compelled to abandon their first line of breastworks when, to their false patriotic indignation, progressive Americans came to the front and demonstrated, with both time and money, that the imported lead keel was superior to the originally imported centerboard.

This was the first decisive victory for reason, and to the FOREST AND STREAM belongs the journalistic credit for the same. When it was further demonstrated, however, that, in order to study (from a distance generally) the beautiful lines of the graceful, symmetrical overhanging sterns of the much-abused "lead mines" (especially in a heavy weather race), it would require almost superhuman exertions on the part of the retrogressive contingent to get their skimming dishes near enough, even in the first part of a race, then their indignation changed to consternation, and the FOREST AND STREAM had won progressive victory number two.

How this lead keel innovation (combined sometimes with the centerboard) was followed by still other new ideas in yacht designing, advocated by the FOREST AND STREAM, such as flush decks, housing topmasts, pole bowsprits and the full cutter rig, is an old story and a matter of true yachting history.

It must be admitted by the conscientious truth seeker, however, that there are still narrow-minded individuals who will stubbornly persist in calling a cutter a sloop if she wins a race, and who will just as stubbornly pronounce the same boat a cutter if she should lose the next race The truth seeking yacht historian of the future, however, will not tolerate nor be controlled by such stupid prejudice as this, but will properly classify boats with cutter rigs as cutters, whether they have centerboards or keels; and he will also give to the FOREST AND STREAM full credit for its gallant fight, and the good it has accomplished.

About the time when this controversy had reached a boiling point, there appeared in the columns of the FOREST AND STREAM the lines of a small yawl named Windward, if I am not mistaken, designed by W. P. Stephens It was from this design that I had constructed the little Roamer, which took part in a race from New Haven to and around Block Island and return, an account of which appeared in a former issue of the FOREST AND STREAM.

Unlike Windward, however, Roamer was rigged as a sloop. While I think that, on account of her small size, she would have given better satisfaction rigged in a less complicated manner, still Roamer proved herself on many occasions an honest and able little cruiser. Many a time have I taken a dash on the Sound in her under single reefed mainsail and jib when the sails of no other yacht could be seen.

Roamer's length over all was exactly 22ft.; waterline, 18ft.; beam, 6ft ,and she drew 4ft. 6in. Her least freeboard was 20in. She had a lead keel of 2,000lbs. in weight, and her inside lead weighed 1,800lbs. and was cast to fit. The cabin roof was raised 12in. above the deck aft and 9in. forward. This roof allowed 5ft. 6in. headroom. The cockpit was a small self-emptying well 4ft. in diameter. There were two bunks, so constructed as to allow sleeping accommodations for four persons if needed. Back of and under the companion stairs there was placed a galvanized water tank, which filled through a lead pipe that led from the cockpit rail. The water was drawn from the tank through a small brass faucet in the cabin. There were plenty of lockers and a small table. This table was hinged to the side, and swung up and buttoned when not in use. She was constructed of cedar, oak, mahogany, and white and yellow pine. Her fastenings throughout were of copper and galvanized iron. She carried two anchors: one 45lbs., the other 35lbs. Her tender was a small, handy skiff, 9ft. long and 3ft. beam.

I had owned alone or had been part owner of a number of boats of different kinds before Roamer was built; but I never realized the amount of real solid comfort that it is possible to extract from a cruise in a small boat until I experienced the same aboard this little lead keel craft.

Now that I have given a rather long description of Roamer and the causes that led to her construction (the lines of Windward in the FOREST AND STREAM, and the lead keel controversy), I will tell of a short cruise taken in her in the month of August, 1885. On this cruise we met conditions that I feel sure would have resulted disastrously to us had we been compelled to depend on a turn-turtle skimming dish. Especially am I sure that such would have been the result if I had had anything to do with the handling of such a boat. I confess that I do not like them, and to a feeling of insecurity when aboard of one. I have myself succeeded on one or two occasions in getting their bottoms where their decks should be.

It was a warm morning and the faintest of zephyrs breathed out of the hazy southwest, barely ruffling the bosom of New Haven Harbor and the Sound. Under mainsail, topsail, jib and jibtopsail, Roamer slowly made her way, with the assistance of the ebb tide, in the direction of Southwest Ledge Lighthouse. Although we made slow progress, we did not mind that much, as it was still early morning.

Our ship's company consisted of three—Thomas Humphreys, George Humphreys and myself. We were jolly and contented; why should we not be? Each one of us was captain and we were all members of the crew at the same time. Under this arrangement individual members of the crew could sass the captain to their heart's content, yet there could be no mutiny.

Past the mounds of old Fort Hale we slowly drifted. It took nearly two hours to reach the mouth of the harbor, and it was six bells before we passed Southwest Ledge Light. From here to Pond Point Buoy it was nothing but drift. The Sound appeared like a huge glaring mirror, encircled by a smoky halo of mist. Out of the edge of this mist would creep now and then a serpentine-like string of coal barges, or perhaps a stray steamboat or steam yacht would put in an appearance. By this time the sun was making deep impressions on our memories, for his greetings were warm.

George has a reputation for improving opportunities, so took advantage of this chance to manufacture large quantities of claret lemonade. I like to take advantage of some opportunities too, so I drank large quantities of George's manufactured article, while Tom blasted his eyes and whistled for wind. We lay motionless halfway between Pond Point and Charles Island from four bells A. M. until seven bells P. M. before we were favored with any wind. When the wind did come, however, it was with a rush and out of the S.W. By two bells the conditions that had existed up to within an hour of that time were completely reversed. Instead of there being no wind there was more than a sufficiency of it. The sea, too, rose so considerably that we were soon pounding our way laboriously through it against the tide under mainsail and jib.

We had thrashed out through the white-crested seas, five miles to windward, and were off Stratford Point, one mile out; George was at the tiller, and Tom and I were hanging on with fingers, toes and eyelids, while we kept a vigilant watch to windward, ready to dodge any stray sea that might be inclined to take a "snap shot" at us over the weather bow. Suddenly there was a sharp snap, and George tumbled into the cockpit with the broken tiller in his hands

Tillerless, of course any boat is at the mercy of wind and wave. This time, however, there was to be no sacrifice of human life to Davy Jones. That we were in a dilemma, however, goes without saying. Had we been compelled to face such conditions with a bob-tailed, triangle-shaped trap we undoubtedly would have had to swim for it. We had hardly time to think, let alone act, when Roamer came up into the wind of her own sweet will and swung off on the other tack; as the wind then hit her with all its force she went down, down, down, until her sails were nearly flattened on the water.

Neptune and his legions found this time, however, a little antagonist fully capable of meeting them in a contest. This was no sandbagger to turn turtle and sink! Gradually eating her way into the wind, she slowly righted until her sails were ashake, then as she fell off she received another knock down like the first one.

The wind and sea toyed with our little vessel in this manner until we managed to disentangle things forward, so as to allow us to lower the sails and let go the anchor. Then as she swung to her cable and bowed defiantly to each oncoming billow, as though challenging them to continue the contest, we realized what we owed to the lead keel.

Six fathoms of cable ran out before our 45lb. right bower found the bottom. As Roamer plunged heavily into the seas, she dragged her anchor and drifted steadily in the direction from which she had come. The tiller had broken off close up to the rudderhead, and in spite of every effort on our part we found it utterly impossible to drive the broken end out. After considerable trouble we managed to lash the boom crotch in such a manner to the rudderhead as to answer for a tiller.

It was after four bells, and we were pretty thoroughly drenched by the time we succeeded in getting our anchor and were away once more, making the spray fly on our way to windward. The tide was running ebb again and the wind came as hard as ever out of the southwest, so we were a good half hour pounding our way back to where the tiller had broken. Although awkward and clumsy, our boom crotch served very well as a tiller. The sun cast long, lance-like shafts of gold aslant the white-crested seas of emerald, or shimmered on schooners' sails and sandy beaches in soft glimmers of light, ere we reached a position that enabled us to start sheet and lay our course for Bridgeport Light. Out on the Middle Ground the lantern of Stratford Shoal Light twinkled in the sun's rays like a far-off star. Gayly we swung in rhythmic time, quartering each snowy crest as we raced over the turbulent billows half a mile off the sandy shore of Long Beach. Out of the golden western horizon rolled masses of snow-white clouds, which, as they mounted the purple vault, burned with all the hues of the rainbow in the rays of the westering sun.

It was nearly eight bells, and the red and white eyes of the lighthouses were silently peering through the dusky night shadows, when Roamer passed the inner beacon in Bridgeport Harbor and cast anchor to the southeast of the long wharf that makes out from the west side of the harbor. After partaking of a substantial supper we retired for the night.

A glance out of the companionway next morning revealed no sign of wind. When breakfast had been disposed of we set to work on the rudderhead, and after considerable trouble we managed to remove the broken tiller end. Taking the two pieces of tiller, we set out in the skiff for a boat-building establishment on a wharf on the west side of the harbor. Here I had constructed, from the toughest piece of wood I had ever seen, a new tiller. I do not remember to what variety this wood belonged, but distinctly remember that it took the edge off the tools which were used in turning it out. When the tiller was finished we went aboard and

got up our sails preparatory to taking advantage of any wind that might stray our way.

The Sound lay as smooth as glass under the sun's scorching rays until nearly eight bells. With a faint west wind we then slipped out of the harbor against the flood tide under mainsail, jib, topsail and jibtopsail. After passing Bridgeport Light we received the benefit of the tide, which now favored us, and made excellent progress in the direction of Penfield Reef Light, passing it at one bell M.

By the time Penfield Reef was two miles astern the wind died entirely out again, and we were left to fry in the doldrums. A heavy haze now settled on the water and before long objects became indistinguishable outside a radius of two and a half miles or so. The sun's rays, however, managed to penetrate this haze and it was so oppressively hot as to impart to us a sense of suffocation. The only object to meet our gaze was Penfield Reef Lighthouse, which, on account of the wavering heat that filled the air, seemed to rise out of a bed of molten copper. To make matters doubly interesting, we were regaled now and then by the heavy grumble of thunder in the southwest. Much to our gratification our expected thunderstorm did not materialize. At five bells we were once more bowling merrily on our way under full sail and over a surface that was wrinkled by a flattering, southerly breeze. The tide had been running ebb for over an hour before the breeze came, consequently we had been carried fully two miles astern. With a fair wind it took but a short time to regain our lost ground, however.

Under the wind's persuasive influence the haze soon departed and the atmosphere became perfectly clear. There was just sufficient wind to put our lee rail within 2 or 3in. of the water's surface under started sheet. Under these favorable conditions we enjoyed those ecstatic sensations of freedom to be experienced only aboard of a boat when on its most perfect sailing point, reaching. With graceful leaning courtesyings, Roamer slid easily over the undulating swells. Meeting the approaching seas, her knife-like stem parted their olive crests in soft furrows of creamy foam. Off Pine Creek Point we passed a number of menhaden seines, they were being hauled by the crews of three or four menhaden steamers that lay rising and falling on the waves near by.

We proceeded in the above manner until six bells, when the wind left us once more, and we lay idly rolling on the waves to the south of the red buoy which marks the Cows Rocks, off Shippan Point.

Like a lusterless copper ball, the sun sank in a sky of dull, hazy yellow. At eight bells the lighthouses were once more sending forth their warning gleams. Night was spreading her sable blanket over the waters; still we lay idly rolling in the same place and there was no prospect of us reaching a harbor. This being the first time we had ever cruised to the westward on the Sound, we were therefore entirely ignorant of the harbors and were naturally anxious regarding our situation.

By two bells we became disagreeably aware of the fact that we might have our hands full of business before long. At that hour a heavy thunderstorm had begun to concentrate its forces in that most fickle quarter, the southwest. Dull flashes of lightning, followed by surly, muttering thunder, trembled at regular intervals athwart the inky sky in that direction. A mile and a half to the north the steady, red glare of Stamford Light peered through the darkness. From its elevated perch in the southeast Eaton's Neck Light sent white warning shafts over the somber waves. Norwalk Island Light too flashed alternating danger gleams of red and white out of the ebony-hued eastnortheast.

Higher and higher climbed the black-robed legions of the storm in the starless sky; fiercer and fiercer the lightning sent its dazzling bolts; deeper and deeper boomed the thunder's mighty voice; the timbers of the little Roamer trembled, and we—well, we would rather have been at home in bed about that time; at least I would.

We had taken in the topsail and jibtopsail and were anxiously awaiting, under close-reefed mainsail and jib, the contest that seemed inevitable. Being unacquainted with the neighborhood, we were undecided as to the best course to pursue, but finally decided to run before the storm for the Norwalk Islands. We had hardly gotten Roamer's bowsprit pointed in that direction before, with a blinding flash and deafening roar, the storm was upon us.

I have often wished for a picture of that scene. Excepting Roamer and the ghostly gleam of the rain-lashed sea, revealed at regular intervals by the lightning's flash, everything was completely hidden from view. Tom and I were in the cockpit handling the boat. The companion slide, open an inch or two, revealed the dimly lighted interior of the cabin and George, with chart and compass before him, coolly directing us how to steer. Although Roamer yawed at a frightful rate, still, considering her small size, she made excellent weather of it and rose and fell on the heavy seas as buoyant as a rubber ball.

Although it remained very dark and cloudy, and the wind and sea continued heavy, we were greatly relieved when the rain ceased to behold the welcome gleams of the lighthouses once more. We were also pleased to find that George from the cabin had directed us correctly in our steering.

After passing a lot of breakers on the port hand which we could plainly hear, but not see, it was not long before we observed a dark object rising and falling on the waves off our starboard bow. By the sound of breakers roaring for a long distance to the east, we judged this object to be the buoy that marks the west end of Green's Ledge. Giving the breakers a wide berth, we ran well to the north of Sheffield Island, then trimming sheet we kept the lead line going and slowly felt our way close in back of the lighthouse; here we anchored in two fathoms of comparatively smooth water. Once more had the little Roamer demonstrated her ability to easily cope with Neptune's briny forces. It was nearly five bells when, after furling our sails, we hung out the riding light and went below. We tackled a late but substantial supper that night with that hungry aggressiveness imparted by hard work in the open air. While it was not raining when we turned in at eight bells, still the sky had a dirty, threatening appearance.

Morning broke with every indication of settled rain. Gray clouds scudding out of the southwest completely covered the sky and banked themselves in heavy masses in the gloomy northeast. When we had disposed of breakfast we hauled our anchor aboard, and at six bells we were once more thrashing our way to windward under mainsail and jib, and against a heavy, lead-colored sea which rolled out of the southwest.

We had gone but a short distance when a disagreeable drizzle set in, compelling us to don oilers and rubber coats. We were fully two hours bucking the heavy sea before we arrived at the place from which we had been compelled to run the night before.

It was three bells in the afternoon when we rounded Greenwich Point, and we anchored in Indian Harbor at four bells. Here we met friends, and our run to the westward ended.

While it took three days for Roamer to cover fifty miles, that is no proof that she was slow, as she covered the same course in eight hours afterward. The able manner in which she behaved under adverse circumstances, however, demonstrated that, were all small cruisers constructed on such safe, sensible lines as hers were, there would be few sailing fatalities to chronicle each year. The greenest, least experienced novice couldn't possibly capsize such a boat.

ETHELWYNN.

(*Concluded from page 295, Oct. 10.*)

IN working under a length classification the designer has an easy task, as the sole limitation is that the yacht shall not exceed in waterline length the limit of the proposed class, and even if she does many clubs have in the past been weak and complacent enough to remit the just penalty by passing each year an exemption clause. The waterline disposed of in this easy way, the designer is free to put on or cut off sail as he pleases, until he has a sail plan that is not only suitable for the stability of the yacht, but that balances as perfectly as is possible. Under the racing length classification and the rules as now rigidly enforced by the leading clubs, the problem is far more difficult; not only must the sail plan be fitted to the power of the hull, but it must be of a certain definite area, as there is no allowance to be had in the event of measuring under the class, and the yacht is certain to be disqualified if she measures over. In addition to this, and no less important, is the balance of sail—one of the first essentials to good windward work.

The proposed figures for Ethelwynn, as already stated, were: l.w.l. 14ft. 6in., sail area 240sq. ft., making 15ft. racing length. Though sailed in some of the races with no ballast, as it was intended that she should be, the yacht was never measured with less than 100lbs. of ballast aboard, with this weight going just over 15ft. l.w.l. Had there been any object in so doing, she could have been brought to about 14ft. 6in., but there was little to be gained by this, as she had not sail enough to make it necessary. The sail plan as first drawn had the same mainsail as shown in the present plan, of 189sq. ft. and a jib of 50sq. ft., that nearly filled the whole fore triangle, the luff nearly parallel to the mast and the clew very low, with a light club on the foot, the single jib sheet working on a traveler across the deck. With a new and unstretched mainsail the yacht balanced very badly, having too much lee helm, although the C.E. was placed well aft of the C.L.R. The mainsail at the same time set poorly and was recut, making it still smaller, and to balance it the original jib was discarded for a smaller one without the club. A new mainsail was made which also proved short on the hoist, but being a good sail, it was carried in the trial and cup races. The final result in the way of head sail was a very small jib cut after the peculiar fashion devised by Mr. Gilbert Wilson. The boat was very sensitive, and while she worked admirably to windward under this odd little sail, she performed indifferently with one to all appearances as good in cut, but half a dozen feet larger.

The dotted lines show the sails as officially measured by Mr. Hyslop, by pegging them down on a lawn, the day preceding the first cup race. The area of mainsail is but 168.6sq. ft., and that of the jib 29.5sq. ft., or 198sq. ft. in all. With the longest measurement of the waterline, with 150lbs. of ballast, the allowance of sail would be 218sq. ft., or 20ft. in excess of that actually carried. While this deficit of over 10 per cent. was a serious handicap in the light winds that prevailed, there was no help for it under the circumstances. The larger jib shown in the plan, of 35sq. ft. area, was drawn later as of the proper size to balance such a mainsail as would fill the spars and at the same time to give the amount of sail which the waterline allowed.

In planning the spars there was little to go on as to the diameters for hollow sticks; the matter was discussed with the spar maker, Mr. Young, and Mr. C. J. Stevens, and the result was a 4¼in. mast. Mr. Fraser, of the Spalding-St. Lawrence Co., advocated strongly a much smaller spar, but was overruled, as it was decided to be on the safe side as far as the stiffness of the mast was concerned, the jib being set flying. The experience of this past year has shown that the spar was far too heavy, even for the rig as originally planned, and more so for the small sails finally carried. With just 100sq ft. more sail, the mast of Glencairn was, we believe, but 3¼in. diameter at the deck. As it was, the runners were not required, but it would seem now that for the sail plan as it actually was a hollow stick of 3in. and of about one-half the weight would be fully strong enough. The boom was also hollow, of about 2¾in. diameter in the slings. The rigging was of phosphor bronze wire rope, headstay $\frac{3}{32}$in. diameter, shrouds $\frac{3}{16}$in. diameter and runners ⅛in. Both main and jib halyards were of the same material, ⅛in. diameter. The main halyard ran over a 2in. sheave in the masthead, a single part with a whip tackle at the deck. The jib halyard was double, with a jig. The running rigging was of imported English cord.

The centerboard was of manganese bronze, of $\frac{3}{16}$in. thickness, weighing about 65lbs. It was, we believe, of a sheet of the metal rolled for the plating of Defender. It was fitted with a lifting arm, a separate casting of bronze, with a tackle to the forward deck just abaft the mast. The board was hung from two brass straps, one on each side, with a pin through the lower ends, as frequently illustrated in connection with canoes. As it proved, the board was too light, bending badly during the cup races and taking a permanent set that could not be removed with the appliances at hand at Oyster Bay.

The rudder construction was something of a novelty; the stock was cast in one piece with an oval rim about 1½in. wide and ⅝in. thick, tapering to a sharp edge on its outside, of the outline shown in the drawings. The main part of the blade, in the center of the rim, was to have been filled in with mahogany, in two thicknesses riveted together. A very good casting was procured, but the rudder was spoiled in the making, being filled in with oak fastened only with a few brass wire nails. The result was that after a couple of days in the water the wood swelled and buckled so badly

SAIL PLAN.—ETHELWYNN.

Designed by W. P. Stephens and built by the Spalding-St. Lawrence Boat Company, 1895.

that the rudder could not be used. In this emergency an old rudder was procured, originally made for an 18ft. Scarecrow, and of rough construction, the two plates being poorly fitted and riveted, the edges being bent and anything but smooth. This was fitted to the boat and carried through the trial and cup races, proving to be of the right size.

In thus minutely describing Ethelwynn we have endeavored to show the boat exactly as she was, with all of her imperfections and defects. These were numerous enough, and perhaps may be considered as not to the credit of her designer and others connected with her, but it must be remembered that the whole work of designing, building and racing her was done in a hurry, and even where mistakes were apparent there was little opportunity to rectify them. Of all connected with her there was no one with the necessary time to give his undivided attention to her proper trial and working up. It is easy enough to see where she might have been materially improved, with larger sails, much lighter spars, and better centerboard and rudder.

Among the many criticisms, mostly, be it said, of a friendly nature, are two that may be properly noted here: one to the effect that Ethelwynn was but a copy of the English half-raters; the other that it was but a small task to defeat Spruce IIII. We have already mentioned our obligations to Sorceress for the idea of the knife board, and the performances of this exceptionally fast yacht, as described in the English journals during her first season, demonstrated the merits of this general type in the small classes. At the same time Ethelwynn is in no sense a mere copy of Sorceress or any other boat, but represents a carefully worked out design with many individual features.

As for the merits of defeating the English challenger, as far as the boat herself is concerned, they were little enough, and we have never claimed to the contrary. In weight of construction; in clumsy and useless fittings, such as the oak tabernacle; in complicated rig, to say nothing of her actual form, Spruce IIII. was not a formidable opponent for any boat of fairly good design and construction. With equal handling Ethelwynn should have sailed away from her every time they met, and probably would have done so. When it comes to comparing crews the case is altered; Mr. Brand had grown up with the half-rating class, sailing year after year from forty to sixty races in a season, and he had with him an exceptionally smart professional who had served as his crew for four years. Spruce IIII. had been planned and built during the winter and had sailed a number of races before coming to America, being tried against the best English boats of the year and changed in many respects to improve her speed; in fact, the conditions of her ownership and handling were such as to bring out everything that was in the boat. Under the Seawanhaka, as compared with the Y. R. A. rule, Spruce IIII. gained in being able to increase her sail area for her American races.

How hastily Ethelwynn was designed and built, with no exact idea of what her antagonist was to be, has already been told. Her helmsman in both trial and cup races, Mr. B C. Ball, though a skillful sailor, was accustomed only to a larger and very different type of yacht; he had never seen a modern boat of the 15 or 20ft. classes prior to sailing Ethelwynn, and being in business and living at a distance from the Sound, he was aboard of her only a few times before the trial races, thus having small opportunity to learn the boat and to improve her. As crew in all but two of the races he had a novice, with no experience in racing, and lacking that practice so essential to the quick handling of sails in these little craft. In the last two races he was very ably seconded by his brother, a skillful sailor, but entirely unacquainted with Ethelwynn, not even knowing the lead of the gear when he went aboard her. As compared with Mr. Brand, with his weight and physique, his long racing experience and his professional crew, the odds were entirely against Ethelwynn in the very important matter of handling, and while she might easily have done more, it is very much to the credit of both Mr. Ball and the boat that they did enough in successfully defending the Seawanhaka cup.

Canada and the Cup.

We can understand how the following letter might be written and sent to the *Field*, as very few of those who discuss the America's Cup on either side of the Atlantic ever take the trouble to study the different deeds under which it has been held. What we cannot understand is, how anything so silly found its way into print, the editor of the *Field* being perfectly conversant with the whole subject, and knowing very well that the barring of the Canadians was done fourteen years ago, and not within a few weeks. This being the case, Mr. Gretton's heroics only serve to make him ridiculous.

Editor, the Field:

It is worth drawing the attention of English yachtsmen to the compliment recently paid to the chief designers in the empire by the New York Yacht Club. That extremely wary body of sportsmen have announced within the last week or so that they will refuse to accept a challenge for the America's Cup from a Canadian yacht club.

Their decision comes treading on the heels of the success of the Canadians in winning the Seawanhaka challenge cup with a ½-rater built and designed in Canada, and the more important and striking success of their champion in winning the International challenge cup of the lakes on Lake Ontario. The latter vessel was designed by Mr. Fife, Jr., and built in Canada.

Every one who has a practical knowledge of yacht racing under the present rating rule knows what an enormous handicap it is to have to construct a vessel on this side of the 3,000 stormy miles of the Atlantic and to sail her over before competing with a vessel specially constructed in America for the purpose of winning two or three special races in American waters. This handicap, it would appear, the New York Y. C. are unwilling to forego, for a vessel might easily be built in Canada designed by the most distinguished British experts, which would escape the heavy handicap of an ocean voyage, and so by courtesy of the captains of American excursion steamers a British yacht might meet the American champion in some future contest on equal terms.

English yachting men will not fail to appreciate this compliment to the skill of British yacht designers. John Gretton, Jr.

Niagara's Tanks.

The recent letter of Howard Gould to the Council of the Y. R. A. was considered at a meeting of the Association on Oct. 12, and the following reply was decided upon:

"Sir: I am directed by the Council of the Yacht Racing Association to acknowledge the receipt of a letter from you dated Sept. 28. I am to reply that the visit of their committee was made in the usual course, solely in consequence of the official measurer having in May, 1896, in the execution of his duty, reported to the Council that the yacht's water tanks were constructed together in such a manner that they might be used in shifting ballast.

"Notice of such visits is never given. The committee expected to find you on board, but hearing from the captain that you had gone to London a few minutes previously, they requested permission to inspect the water tanks, which was readily given. Their observation confirmed the report of the measurer, and they recommended to you, in writing, that the tanks should be disconnected, at the same time expressly disclaiming any imputation that the tanks were actually put to improper use.

"The Council fail to perceive that any discourtesy was displayed toward you; certainly none was intended. It is not necessary to enter into discussion of the other points raised by your letter. As you have thought fit to make your grievance public, it is proposed that this reply pass through the same channel. Dixon Kemp."

The case of the Earl of Dunraven's twenty-rater Audrey, which won the Dunraven challenge cup in the races held at Calshot under the auspices of the Castle Y. C. on Aug. 10, and was disqualified by the Castle Y. C. on the ground that the yacht was not qualified to race for a prize offered by her owner, was taken up and disposed of. The Association upheld the ruling of the Castle Y. C. and awarded the cup to Niagara, which finished second in the race.

The Association also decided that centerboards in future shall be measured at their greatest depth, so they will count in girth measurement the same as a fixed keel.

The rules for measuring yachts over 36ft. lineal rating were not changed, but the rules for the measurement of yachts under that length were altered.

The Improvement of Racing Rules.

It is one hopeful sign of the times in yachting that at last a general movement has set in for the amendment of racing rules, especially the measurement and classification rules; and that the agitation in this latter detail has at last taken the form of a proposal to limit in some way the extreme features which are doing so much to hurt yachting and yacht racing. The Larchmont Y. C. has already taken steps to impose arbitrary limits to draft and sail area in all classes, and the Seawanhaka, the New York and the Yacht Racing Union of Long Island Sound are engaged in the consideration of the best changes that may be made.

A meeting of the race committee and several members of the Seawanhaka C. Y. C. was held last week at the suggestion of Com. Rouse; the result of a long discussion of various proposals being a determination that the most desirable end was the amendment of the present rule by the addition of some factor tending to produce an increase of displacement and depth of body. The subject will be continued at future meetings.

Among the various proposals for temporary measures tending to promote racing among existing boats next season is one set forth by Irving Cox, of Gardner & Cox, the designers of Norota and Quissetta, as follows:

I understand that the race committee of the Seawanhaka Corinthian Yacht Club have at present under consideration the advisability of reformulating the rule known as the Seawanhaka corrected length rule, governing the time allowance received by a smaller yacht from a larger one. I also understand that the proposed change is in no way on account of any failure of the rule between boats of the same general type as Colonia, Emerald, Amorita, Quissetta, representing the latest advance in design and construction, or as between Marguerite, Sachem, Mayflower, Sea Fox and Iroquois, representing the cruising class; but when boats of both types are raced together in one class a system of time allowance, based solely on waterline length and sail area, is manifestly inadequate and favors the boats of excessive draft and over all length.

When the formula, load waterline length, plus the square root of the sail area divided by two. equals the racing length, was evolved, racing yachts were radically different in model from the present canoe form, with weighted fin-like underwater body, and in order to bring the two types together in a race we must tax the excessive proportions of the newer boats, not to the extent of forcing any reversion of type, but simply to bring about a fair race between boats of practically equal size, although of unequal dimensions. Furthermore, the present type of racing yacht, while undoubtedly fast, has some very undesirable features. Comparing the models of the Iroquois and the Amorita, the former gives a good cruising boat, easy in a seaway and with proper distribution of weights to make her so. She also, thanks to her large keel line, will be steady running and will lay to well. She will have more cabin room than the other on very much less draft of water, and will cost a third less at least. The Amorita type is faster, it is true, but at what a cost. She has so great a metacentric height, in other words, her righting lever is so long and the weight at the ends so heavy, that she is practically dangerous in a seaway. Her lateral resistance is so centralized that when hove to there is danger from broaching to with every wave that strikes the long overhanging ends, and finally, she is in danger of grounding in most of our home ports, and cannot make Southern cruises on the same grounds.

As a result of comparing all the forms of the best known cruising and racing schooners of to-day, together with their records in races, I have evolved a formula, or rather an addition to the existing formula, which seems to fit the purpose I have had in view, namely, to encourage yacht racing without unduly taxing any element either of seaworthiness or of speed. I simply add to the present racing length a proportionate amount for every increase above the normal in draft, over all length and sail area. I find that a modern racing schooner's draft varies as 1.4 multiplied by the square root of the load waterline, and that a mean of existing boats gives a proportion of over all to load waterline length of 100 to 75, or for allowable over all length take 1.33 multiplied by load waterline length, and that a fair mean of the square root of the sail area is 1.05 multiplied by load waterline length, or, in other words, that the square root of the sail area is on the general average 5 per cent. more than the load waterline length.

Now, my contention is that up to these limits boats are fair and normal, and should pay no penalty for excess in dimensions, but that above these proportions boats are machines and abnormal, and should pay an extra penalty when racing with a normal and sensible type of boat. My formula for obtaining amount of said extra tax is as follows:

Let A equal excess of draft on 1.4 multiplied by the square root of the load waterline.

Let B equal excess of over all length above 1.33 multiplied by load waterline length.

Let C equal the excess of the square root of the sail area above 1.05 multiplied by load waterline length.

Then A multiplied by 3, plus B, plus C, plus the load waterline length, and the square root of the sail area divided by 2 equals the racing length.

Excess of depth has a value of six as against the value of one for excess of length and excess of the square root of the sail area, because depth and length are as six is to one, and inversely the square root of the sail area is supposedly equal to length in speed value.

To illustrate this point, compare the dimensions of Amorita and Iroquois. Amorita is, roughly speaking, 99ft. over all, 70ft. on the waterline. 13ft. draft, and 80 square root of the sail area. Her racing length is 75ft. Iroquois is 97ft. over all, 80ft. on the waterline, 10ft. draft, 84 square root of sail area, racing length 82ft.

The new formula for Amorita will be A equals excess of draft over 1.4 of the square root of the waterline equals 13 minus 1.4 multiplied by 8.367 equals 1.3. B equals excess of over all length above 1.33 multiplied by load waterline equals 99 minus 1.33 multiplied by 70, equals 5.90. C equals excess of square root of sail area above 1.05 multiplied by load waterline length equals 80 minus 1.05 multiplied by 70 equals 6.50.

Then the formula will work out as follows:

$$\frac{3.9+5.90+6.50+70+80}{2}=83.15=\text{racing length.}$$

The Iroquois has no excess of length over the dimensions that are suggested to get taxed and her racing length is the same under both rules.

On Oct. 8 a meeting of the council of the Y. R. U. took place, at which the following changes were proposed, to be submitted later on to the union:

That no special classes be recognized for the coming season, it being desirable to reduce the number of classes, which action, if adopted, will have the effect of making the 34ft. raters sail in the 36ft. class of sloops, the 30-raters in the regular 30ft. class, the 21-footers in the regular 25ft. class, the 1-raters in the regular 20ft. class, and the ½-raters in the regular 15ft. class.

That there be no time allowance from other yachts in their classes for yachts launched after Nov. 1, 1896, in order to encourage the building of yachts to the full limit of the classes.

That one-gun starts be generally adopted.

That if practicable a uniform starting hour be generally adopted, and that this hour be not later than noon.

That Wednesdays be accepted as racing days as well as Saturdays on account of the large number of races given on the Sound and the inadvisability of holding more than one race on the same day.

It was also decided to offer the following amendments to the racing rules:

An addendum to be added to the measurement rule providing for the measurement of yachts using jibheaded mainsails.

All yachts in the 30, 25, 20 and 15ft. classes to be measured with an empirical weight of 150lbs. aboard for each man aboard allowed for crew, but any yacht increasing her measurement beyond her class limit by the application of this rule to be considered as in her class, but time to be allowed on her actual racing length.

That the 80ft. class of sloops be abolished.

That the provision for allowing the use of shiftable ballast in certain classes of open yachts be done away with.

That there be no classes for open boats over 25ft. racing length, and no classes for cabin yachts of 20ft. racing length and under.

That the allowance for crew in the 36, 30 and 25ft. classes be reduced to seven, five and four men respectively, and that the allowance for crews in the schooner and large sloop classes be somewhat increased.

That racing numbers be placed upon the leech instead of the luff and near the peak of the mainsail.

That instead of allowing ten days for a yacht to file her official measurement, all yachts be officially measured and hold measurement certificates before being allowed to start.

That the signal for sailing the course in a reverse direction shall be flag "B" of the code displayed above the preparatory flag.

A. C. A. Membership.

Applications for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the Forest and Stream.

YACHTING NEWS NOTES.

On Sept. 25, during a gale on the English coast, Mr. J. A. Brand's 20-tonner Tina had a narrow escape from shipwreck in Portland Roads. On the preceding day she left Dartmouth with Mr. Brand aboard for Wivenhoe, on the east coast, to lay up, but was caught by the storm and put into Portland Harbor. With the wind from S.W., she was on a lee shore next morning, and when her second cable parted she was in great danger of drifting on the breakwater, but after much difficult work she was taken in tow by a tug and safely moored in Weymouth Harbor, having met with but trifling damage.

Margarita II., steam yacht, A. J. Drexel, is now at Cramp's yard for docking and painting, preparatory to a long cruise to the Mediterranean, thence through the Red Sea to China and back, in time for the spring regattas on the Riviera. The steam yacht May, recently purchased by Mrs. Sarah G. Fell, sister to Mr. Drexel, has fitted out at the Erie Basin dry docks, and will sail in company with Margarita for an extended cruise. Mrs. Fell's former yacht, Barracouta, has been laid up on the sale list at Tebo's.

Gnome, the Herreshoff 15-footer built this year for F. M. Hoyt, has been sold to Harold M. Faxon, of Quincy, Mass., who will refit her with a larger rig and race her in the class of 15 to 18ft. in the Massachusetts Y. R. A. As a 15-footer Gnome was a complete failure, but it may be that she is capable of improvement by alteration. Her weak point, like her older sister, Olita, was in windward work.

Seabury & Co., now of Morris Heights, will begin at once a steam yacht for Chas. Fleischmann, owner of the Hiawatha, built last winter by the firm. The new yacht will be 178ft. over all, 140ft. l.w.l., 21ft. beam, and between 11ft. and 12ft. draft, with steel hull. The yacht and her machinery will be designed as well as built by Seabury & Co.

At a meeting of the governors of the Penataquit Corinthian Y. C., of Bay Shore, L. I., it was decided to offer a cup costing $100 for the 15ft. class next season, to go to the yacht winning the greatest number of races in a series of seven, only club boats being eligible.

The suit of J. Montgomery Strong against the Atlantic Y. C. has been discontinued upon the consent of all parties and the injunction vacated. The matter has not yet been settled in the club.

Intrepid, steam yacht, Lloyd Phoenix, while at Southampton on Sept. 24, was fouled by another yacht during a gale, sustaining some damage. She is now, from all reports, on the Atlantic, bound for New York.

Arcturus, steam yacht, Rutherford Stuyvesant, was in a heavy gale off the English coast on Sept. 24, losing her lifeboat and jib, and damaging her cutter.

Sanibel, steam yacht, Rutherford Stuyvesant, has been sold through Manning's Agency to Chas. R. and Wallace B. Flint, who will use her at once in the Chesapeake.

The Racine Boat Manufacturing Co. has contracted to build a sixteen-mile steel steam launch for Gen. J. T. Torrance, to be 45ft. long and 8ft. beam.

Tacoma, sloop, has been sold by S. N. Small to Melbourne MacDowell, former owner of Cleopatra.

Rifle Range and Gallery.

Cincinnati Rifle Association.

Cincinnati, O., Oct. 4.—The members of the Cincinnati Rifle Association made to-day the scores given below on two separate targets. The conditions were: 200yds., off-hand, standard target, and 200yds., off-hand, at a 20-ring target, with 1in. rings counting from 1 to 20, the center ring, 2in. in diameter, counting 20. Some creditable scores were made on this target, and it seemed to give very general satisfaction. Scores:

Revolver Shooting in New York City.

New York, Oct. 9.—The revolver contest which has been held at the gallery of the Knickerbocker Club, Forty-fifth street and Madison avenue, during the past ten days, has been brought to a conclusion. The prize was a hunting scene, by A. B. Frost; it was won by Dr. R. H. Tozier, who made 50 out of a possible 60. The conditions were: 40yds., standard target reduced for this distance, best 6 shots to count. Dr. J. A. Boyken was second with a score of 47. Other scores were: A. A. Cohen 45. W. J. Furness and H. E. Westberg 44, G. E. Grey 43, J. L. Ivey 41, H. J. Smith 40.

Mr. A. A. Cohen fired 40 shots with a .40cal. revolver, at 20yds.; the 4 targets of 10 shots each showed as follows: 91, 90, 91 and 92. This is the best on record so far as I know.

The revolver club shoots every Thursday evening. J. S. Conlin.

Calumet Heights Rifle Scores.

Chicago, Ill., Oct. 3.—The rifle shooters of the Calumet Heights Gun Club shot their scores to-day in the regular weekly shoot, Norcom winning the medal in Class A and Miss Ervin in Class B. Scores:

Class A.—200yds., off-hand, standard target:

Paterson.....2032433222—23 Spalding.....0333033023—20
Norcom.....3344244430—31 Lamphere.....4233333433—31

Class B.—For ladies, 100yds., Creedmoor target, with rest:

Mrs Marshall.....3332353333—31 Miss Ervin.....5444434544—41

Patty.

Trap-Shooting.

FIXTURES.

Oct. 16-17.—Tacoma, Wash.—Tournament of the Washington State Sportsmen's Association, under the auspices of the Tacoma Rifle, Rod and Gun Club. G. H. Garrison, Sec'y.

Oct. 17.—Hackensack, N. J.—Fifth monthly shoot of the New Jersey Amateur Trap-Shooters' League, under the auspices of the Oritani Field Club.

Oct. 23-24.—Marion, N. J.—Merchandise shoot of the Endeavor Gun Club. Targets. Entries in 100-target handicaps close Oct. 22, to A. R. Strader, 371 New York avenue, Jersey City, N. J., or to Carl von Lengerke, 8 Murray street, New York city. Entries to be accompanied by $2 forfeit.

Oct. 26-27.—Liberty, Ind.—Tournament of the Red Owl Gun Club. Live birds and targets. R. A. Creek, Sec'y.

Oct. 27-28.—Elizabeth, N. J.—Eighth bi-monthly tournament of the Elizabeth Gun Club. First day, targets; second day, live birds.

Oct. 28-29.—Ironton, O.—Third annual tournament of the Iron City Gun Club. Targets.

Oct. 29.—Macon, Ga.—All-day shoot at live birds, under the auspices of the Macon Gun Club. F. C. Etheridge, Sec'y.

Oct. 29-30.—Dexter Park, L. I.—Tournament under the auspices of the Emerald Gun Club, of New York. First day, targets; second day, live birds.

Nov. 7.—Hackensack, N. J.—Cup contest, under the auspices of the Bergen County Gun Club. C. O Gardiner, Sec'y.

Dec. 1-3.—Trenton, N. J.—Proposed contest for live-bird championship; 100 live birds per man, $100 entry. Under the management of Charles Zwirlein.

1897.

Jan. 4-5.—Prescott, Arizona.—Fourth annual tournament of the Arizona State Sportsmen's Association, under the auspices of the Prescott Gun Club. Roy Hill, Sec'y.

January.—San Antonio, Tex.—Second midwinter tournament, under the management of Oscar Guessaz, etc.

March 23-25.—New York City.—The Interstate Association's fifth annual Grand American Handicap at live birds.

April 15-17.—San Antonio, Tex.—Tournament of the San Antonio Gun Club. Open to amateurs only. Willard T. Simpson, Chairman Ex. Com.

June (third week).—Cleveland, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The programme issued by the Iron City Gun Club, of Ironton, O., for its tournament, Oct 28-29, is not only artistically a success, but contains a schedule of events that ought to draw out all shooters in the vicinity of Ironton The Rose system of dividing purses will be adopted; in all 10 and 15-target events there will be three moneys; in all others there will be four moneys. Targets will be thrown at 2 cents each. The club's grounds are at Fifth and Oak streets. The programme for the first day consists of four 10-target events, $1 entrance; three 15-target events, $1 50 entrance; two 20-target events, $2 entrance, and one event at 25 targets, $2.50 entrance; a total of 150 targets, $15 entrance. On the second day, Oct. 29, there are only six events—a 10, two 15s, two 20s and a 25-target event, at an average entrance of 10 cents per target. The programme states that on this day "at 2 o'clock the match race will be shot between Capt. A. W. West and C. E. Verges, of Ohio, vs. Levi Stevens and Robert Clarke, of West Virginia, 50 live birds per man, for a stake of $400." Considerable interest is evinced in the outcome of the above match.

Mr. C. O. Gardiner, secretary of the Bergen County Gun Club, sends us the following communication in regard to offer of a silver cup, emblematic of the championship of New Jersey at targets: "A handsome silver challenge championship cup has been offered in the interest of trap-shooting in the State of New Jersey by G. O. Shields, editor and manager of *Recreation*. This trophy will represent the championship of the State of New Jersey, and members of all New Jersey clubs will be eligible to compete for it. The cup will be shot for under the auspices of the Bergen County Gun Club. At a meeting of that club held very recently it was agreed to hold the shoot for the state championship Nov. 7, notice of which date has already been given in Forest and Stream. The cup, which is a very handsome one, will be exhibited in a few days at Messrs. Schoverling, Daly & Gales, 302 Broadway. Several of the well-known shots of the State have approved this method of deciding who is the real champion target shot of the State, and several representatives of leading clubs have promised their hearty support of this movement. The full conditions will be announced in a few days."

The postponed annual meeting of the Cobweb Gun Club, of New York city, was held on Friday evening last, Oct. 9, in the club's rooms, 2277 Third avenue. There was a fair attendance of members. The chair was taken by Vice-President P. F. McKeon at the request of President George Barker, who was also present. The officers elected for the ensuing twelve months are: President, A. C. Bage; Vice-President, Hon. R. Arnow; Treasurer, R. Hughes; Secretary, G. W. Thompson, Jr.; Captain, P. F. McKeon; Assistant Captain, M. B. McDonnell. The board of directors will be chosen at the next regular meeting of the club. A committee of three was appointed to consider the advisability of holding a tournament during the week of the Sportsmen's Exposition, the week commencing March 17, 1897, the committee to report at the next meeting. The club showed its appreciation of the services rendered the club in the past by its late captain, Fred L. Train, now of Boston, Mass., by unanimously electing him an honorary member of the club, an honor shared by only three members.

Jack Rogers, a resident of Newburgh, N. Y., makes an able assistant cashier and a capable newspaper man. He also has some of the essentials of a diplomat; he can remember faces; his failing is that he has a poor memory for names and doesn't know it. We were standing in the office of the United States Hotel at Newburgh, N. Y., talking to Byer, of Rochester, when in walked Mr. Rogers. "Hello, Robbins," said he, wringing our right hand warmly, "when did you get in?" Our look of distress warned him that he had made a mistake, so he hastened to apologize, adding: "I'm afraid you'll not feel complimented at my error?" Then the conversation lagged a moment while he thought again. This was the outcome of that thought: "How's the magautrap?" "It's all right," said we, somewhat mystified. "Got one with you?" was his next query. Then it flashed across us that we were Paul North! Jack Robbins and Paul North can settle this thing between themselves. We settled it with Rogers.

A two-days' tournament will be held at Dexter Park, L. I., Oct. 29-30. The first day's programme consists of ten events at targets; the total number of targets on the programme is 175, the entrance money being $17.50. A certain sum of money, ranging from $1 up to $6 in each event, is added to the purses, the amounts being graduated according to the number of entries. Targets will be thrown at 2 cents each; the Rose system of dividing purses will be adopted. On the second day there are three events at live birds. No. 1 is at 5 birds, $3, 28yds. rise, birds included in entrance fee; No. 2 is 7 birds, $5, birds included, 28yds. rise; No. 3, called for 12:30 P. M., is the Dexter Park handicap, 15 birds, $10, birds included, handicaps 25 to 31yds. If fifteen entries in this event, $10 added; if twenty entries, $15 added. Purses in all live-bird events will be divided on the Rose system. The shoot is given by Mr Lippack, proprietor of Dexter Park, under the auspices of the Emerald Gun Club, of New York city.

Mr. Fred E. Atkins, secretary of the gun club organized at Waterbury, Vt., on Friday, Oct. 9, sends us the following clipped from a daily paper of that city: "At the business meeting of the gun club last Friday evening the following officers were elected: President, Dr. G. S. Bidwell; Vice-President, Dr. J. T. Wheelock; Secretary and Treasurer, Fred Atkins. Directors: John Deal and C. M. Griffith; Captain, George Dumas. A practice shoot is to be held every Saturday afternoon." Mr. Atkins adds: "Above is a result of two of our members attending the Interstate Association's tournament at Burlington, Vt. We are a small club, but hope to grow."

Jack Fanning, the expert shot who left the Pacific slope last spring to come East and show us what he could do with Gold Dust powder, has returned to his home in the far West. Since he arrived in California he has made things very warm for those who had been left behind. At the annual tournament of the California State Sportsmen's Association he carried off pretty nearly everything in sight. On Oct. 2 he killed 41 live birds straight, winning the Gold Dust diamond medal with a score of 20 straight. Crittenden, Robinson and Feudner were next to him with 19 out of 20, Robinson losing his twentieth bird.

The Macon (Ga.) Gun Club will hold a shoot at live birds Oct. 29 The events, three in number, are open to all. No. 1 is at 5 birds, $3, 2 moneys, birds included; No 2 is at 10 birds, $7.50, birds included, 3 moneys; No. 3 is a 25-bird handicap, birds extra, 4 moneys, handicaps from 25 to 32yds. The Butt's gold medal, emblematic of the live-bird championship of the Macon Gun Club, will be awarded to the winner in this event. Only members of the club are eligible to compete for the medal. For any further particulars address F. C. Etheridge, secretary Gun Club, Macon, Ga.

W. G. Sergeant, of Joplin, Mo., sends us the following account of a shoot between two-men teams from Weir City, Kan., and Joplin, that took place recently: "We take off our hats to Weir City. You will notice that I gracefully brought up the rear. Conditions: 100 targets per man, unknown angles, $50 per team. Scores: Weir City—C. H. Calhoun 96, W. W. McIlhany 95—191; Joplin—Cox 92, Sergeant 85—177." Sergeant now knows how it feels to be at the tail end of a procession. It is very seldom that he gets a chance to have such an experience.

J. L. Lequin, secretary of the Hazard Powder (Blue Ribbon) Company, tried his 'prentice hand at targets at the Newburgh shoot. His scores do not appear in our tables—for cause After shooting in two 20-target events he withdrew, expressing his intention of holding a tournament by himself and for himself, donating as a special prize a full-fledged incubator.

Shooters in the vicinity of New York should not forget the prize shoot of the Endeavor Gun Club, of Jersey City, N. J., to be held on the Marion grounds, Oct. 23-24. The management of the club is working hard to make the shoot the success it should be, and the inducements it offers ought to draw a large attendance of amateurs. Entries for the handicap events (a 100-target handicap event each day), accompanied by $2, the price of the targets, should be made not later than Oct. 22 to Carl von Lengerke, 8 Murray street, New York city, or to A. R. Strader, 371 New York avenue, Jersey City, N. J. Either of the above named gentlemen will be glad to furnish any further information that may be asked for.

On Saturday, Oct. 5, the 5-men team of the South Side Gun Club, of Milwaukee, Wis., tried to beat the high total already put up by the Waukesha team in the contest for the Burnham medal. The trial took place at the Lake Station grounds, but was unsuccessful, the scores only aggregating 123 out of 150, a good team total, but not high enough to set a new record for the medal. The scores were: Johnson 28, Holtz 27, Seefeld 25, Drought 22 and Milbrath 21. Each man shot at 30 targets.

At the weekly shoot of the Audubon Gun Club, of Buffalo, N. Y., held on Saturday, Oct. 5, 18 members took part in the club shoot. C. S. Burkhardt won the badge in Class A with 22 out of 25. The winners in the B and C classes were respectively J. J. Reid, with 19 breaks, and McCarney, with 21. The Audubon Club's grounds are now under the management of Mr. Garby. The annual prize shoot of the club was held on Saturday last, Oct. 10.

Fixtures for next season come in slowly. It begins to look as if we were to have a respite from big tournaments in 1897. Probably one of the largest affairs of the kind to be held next year will be the one at Syracuse, N. Y., to be held under the auspices of Mr. Jenkins, of the Syracuse *Herald* Mr. Jenkins is already planning great things for this shoot, and it may be taken for granted that no mistake will be made in drawing up an attractive programme.

Attached to a copy of the score of the Claridge-Malone match for the Du Pont trophy, sent us by H. P. Collins, of the Du Pont Powder Co., was the following note: "Claridge accepts Roll's challenge, and 147 challenges the winner of that race." That means that George Roll, of Blue Island, Ill., will have to come to Baltimore to shoot Claridge for the trophy, and that John L. Winston, of the Austin Powder Co., will tackle the winner of that match.

Elmer E. Shaner has been considerably under the weather since the State shoot at Harrisburg, having been confined to his bed for several days. In a personal letter to us, written Oct. 8, he says: "This is my first appearance at my desk since my return from Harrisburg" Mr. Shaner was far from being a well man at the commencement of the shoot, and the heavy rain that prevailed on Sept. 29 undoubtedly had a good deal to do with the above attack of sickness.

The fifth shoot of the New Jersey Amateur Trap-Shooters' League will be held on Saturday next, Oct. 17, on the grounds of the Oritani Field Club, Hackensack, N. J. Sweepstake shooting will commence at 10 A. M., League team race at 2 P. M. sharp Take trains from Erie depot to Central avenue, Hackensack, or New York, Susquehanna & Western to Hackensack. Two sets of traps will be in position.

In the programme issued for the tournament at Dexter Park, L. I., to be held under the auspices of the Emerald Gun Club, of New York, a mistake was made in the names of the officers of the club. The officers who look after the welfare of that club are: President, Louis Schortemeier; Vice-President, Frank Lawrence; Secretary, Dr. G. V. Hudson, 9 Madison street, New York City; Treasurer, John H. Moore.

On the second day of the Paris, Ill., tournament, Oct. 2, the team race between teams from Paris, Terre Haute, Maitoon and Charleston resulted in a win for the teams in order named above. The Paris men scored 105 to 99, 92 and 88 respectively. The scores of the Paris team were: Draper 24, Smith 24, Davis 23, Kerns 20, Postner 14; total 105.

On his return from the shoot at Baltimore last week, Elliott expressed himself in regard to Claridge's capabilities as a live-bird shot as follows: "They rather underrate that young man's capabilities. He's a rattling good shot on live birds, and can make anybody hustle to beat him."

A short time ago Adrian C. Anson and McPherson, the latter a member of the Pittsburg (Pa.) Gun Club, shot a race at 50 live birds on the Davis Island grounds, at Pittsburg. McPherson beat the ball player by the score of 47 to 44. McPherson ran his first 25 straight.

The Independent Gun Club, of Reading, Pa., will probably hold a big tournament at targets and live birds some time early in the spring of '97. A substantial sum of added money will be hung up for the boys to go after.

The Elizabeth (N. J.) Gun Club's eighth bi-monthly tournament will be held on Oct. 27-28. Targets the first day and live birds on the second day.

Oct. 13. EDWARD BANKS.

Martinsburg Shooting Association.

MARTINSBURG, W. Va., Oct. 7.—The Martinsburg Shooting Association held a tournament yesterday and to-day. There was a good attendance at the shoot, and much interest was taken in the decision of each event. To-day a special event at 25 targets was on the programme; the winner in this event was to be entitled to the honor of claiming the championship at targets of Frederick and Washington counties, Md., and Jefferson and Berkeley counties, W. Va. The event, which is No. 1 in the table of scores given below, resulted in a well-earned victory for C. A. Smith, a member of the Frederick Gun Club, with the score of 23 out of his 25. A strong wind blew over the traps during the day, making high scores extremely hard to secure. The scores made to-day were as follows:

Events:	1	2	3	4	5	6	7	8	9	10	11
Targets:	*25*	*15*	*20*	*10*	*15*	*20*	*15*	*15*	*15*	*10*	*15*

GEO. W. THOMPSON, JR., Sec'y.

In New Jersey.

AT ELKWOOD PARK.

Sept 30.—There was only a small gathering of shooters at Elkwood Park to-day, but those who put in an appearance got all the shooting they could ask for. Nine events in all, besides a match at 10 birds, were decided. All the 10-bird races were $10 entrance, and all the 5-bird events were $5 entrance; each event was "high guns." Scores:

Events:	1	2	3	4	5	6	7	8	Events:	1	2	3	4	5	6	7	8
Birds:	*10*	*7*	*5*	*5*	*5*	*5*	*10*	*10*	Birds:	*10*	*7*	*5*	*5*	*5*	*5*	*10*	*10*
P Daly, Jr.	9	6	..	..	..	..	7	7	A Loening	6	5	..	..	..	..	..	..
W Patten	8	5	2	3	5	5	..	6	Seymour	..	..	..	4	5	5	5	5
E G Murphy	7	7	..	..	..	..	9	10	B W Singer	..	..	..	3	3	3	3	..

In another event at 10 birds Murphy and Daly divided with 9 kills each

Walter Patten and B. W. Singer shot a match at 10 birds, Singer winning by 4 birds.

ORITANI FIELD CLUB.

Oct. 10.—No withstanding reports to the contrary the Oritana Field Club held their monthly shoot Saturday for the club cup. This is a handicap event of 50 targets. The following gentlemen entered: Messrs. Sloan, Henderson, Blauvelt, Snyder, Banta, G. P. Ricardo Wm. Ricardo, G. Ricardo, Smith, Conklin and Holberton. Mr Banta, with a handicap of 9, and Holberton, with 10, tied for first place with a total of 50. The tie will be shot off on Saturday, Oct. 24. The following sweeps were shot during the afternoon:

Events:	1	2	3	4	Events:	1	2	3	4
Targets:	*15*	*10*	*10*	*10*	Targets:	*15*	*10*	*10*	*10*
Smith	8	..	..	..	R Snyder	10	9	6	6
G P Ricardo	15	9	10	..	T Barow	11	8	6	..
J Conklin	11	9	..	..	B auvelt	..	5	7	8
J H Sloan	10	..	..	..	G Ricardo	..	..	6	7
J W Holberton	11	7	7	7					

During the afternoon John L Brewer gave an exhibition of target breaking, scoring 49 out of 50 targets. The targets were all well centered. This expert shooting was loudly applauded by those present. The day was most unfavorable for good scores, as there was a strong northeast wind, amounting to almost a gale, blowing in the face of the shooters.

The club shows its progressive spirit by providing two sets of traps for its next league shoot, which occurs Saturday, Oct. 17. This will enable those who do not shoot on the team to continue sweepstake shooting while the team shoot is in progress. J. W. HOLBERTON.

FORESTER GUN CLUB, OF NEWARK.

Oct 10.—The Forester Gun Club, of Newark, held its regular shoot to-day. The scores made by the seven members present were as below:

Events:	1	2	3	4	5	6	7	8	Events:	1	2	3	4	5	6	7	8
Jewell	7	8	7	8	8	8	7	..	Dr Cummi'gs	6	7	5	9	7	9	8	7
D Fleming	6	8	6	7	6	8	..	..	Wambold	..	..	..	8	8	..	..	..
Winans	3	6	..	..	2	3	3	5	C Smith	..	..	..	..	8	7	7	8	9
T Smith	10	8	7	8	6	7	7	8									

Nos. 1 and 4 were at known angles; Nos. 3, 5 and 7 at unknown angles; Nos. 2, 6 and 8 at reversed order. H. E. WINANS.

ARLINGTON SHOOTING ASSOCIATION.

Oct 7.—Inclosed are scores made by members of the Arlington Shooting Association at their regular monthly shoot held to-day. Didn't I tell you that Tony Schuler would be all right when he shot a good gun and W-A powder? Scores in the club event were:

A Schuler	01101	11011	11010	11111	11110—19
M Herrington	11011	10110	11100	10111	11111—19
W W Keyler	01101	11010	11100	11110	11011—17
J Sickles	11010	01110	01010	11100	11101—15
J L Simpson	11001	11010	11010	11110	01000—14

M. HERRINGTON.

BERGEN COUNTY GUN CLUB.

Oct. 10.—The shooters of the Bergen County Gun Club, of Hackensack, were disappointed to-day when, at 3 P. M., Capt. Smith, of the Maplewood Gun Club, appeared with a four-men team to shoot the first of a series of three races, twelve men a side. The Be gen County men had a full team on the grounds and expected a hard brush with their guests. Captain Smith found it impossible to muster his men, so many had gone game shooting. The race was postponed and will probably be shot next month. Notwithstanding this mishap a pleasant afternoon's shooting of sweepstakes was enjoyed by the twenty or more who took part during the afternoon. Near the close of the day two teams were chosen by Louis H. Schortemeier on one side and T. Bell on the other. Shorty's team won by several birds.

During the entire afternoon the wind blew half a gale, and the targets were thrown fast and low, making the shooting very difficult.

Several of those present congratulated President Bell on behalf of the club in securing a handsome silver challenge cup, which will represent the championship of the State of New Jersey.

The team race above mentioned resulted as follows:

Schorty's team: Schorty 24, Brewer 24, Canfield 21, Smith 19, Banta 18, Drake 16—122.

Bell's team: Apgar 20, Dallett 19, Bell 18, Griffiths 18, Capt. Money 16, Beatty 15—106.

Capt. A. W. Money and President Bell shot a race at 25 targets, the result being a tie with 23 breaks each.

Scores in the sweepstake events were as below:

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7

C. O. GARDINER, Sec'y.

On Long Island.

EUREKA ROD AND GUN CLUB.

Sept. 29.—The Eureka Rod and Gun Club held its first live-bird shoot for this season on the Bay Side grounds, L. I., this afternoon. The weather was rather wild, there being a strong wind across the traps that aided the birds very much. Beaumont, Worthley and Wunderlich made clean scores in the club event, which was at 7 birds. On the shoot-off for the badge, miss-and out, Beaumont won on the second round. Scores:

J J Beaumont (27)	2222222—7	Dr Jelliffe (26)	0220222—5
H Wunderlich (27)	2111211—7	W H Rydesburg (25)	0022110—4
J G Worthley (27)	2122122—7	H A Nolan (26)	1011000 3
C P Herbert (28)	2210111—6	A J Reinecker (26)	1020200—3
P Ulrich (27)	1110212—6	J Anderson (26)	0010002—2
C T Morrissey (28)	1022102—5		

BERGEN ROD AND GUN CLUB.

Oct 3.—The fourth competition for the trophy offered by the president of the Bergen Rod and Gun Club, of Brooklyn, for competition among the members of the club, took place this afternoon on the club's grounds at Flatlands. The event is a handicap, 15 live birds per man. Capt. Hamilton, R. J. Frazer and R. W. O'Brien tied for the trophy on 14 kills each. On the shoot-off, miss-and out, Capt. Hamilton won on the 5th round. Scores:

Capt. James W. Hamilton (28) 14, Robert J. Frazer (26) 14, Richard W. O'Brien (27) 14, Robert J. Valentine (30) 13, Philip H. Myles (29) 13, Andrew T. Morrey (26) 11, Louis G. Jenkins (26) 9, Thomas L. Murphy (26) 7, Nelson T. Ellery (26) 5.

CONEY ISLAND ROD AND GUN CLUB.

Oct 7.—Twelve members of the Coney Island Rod and Gun Club took part in the regular monthly live-bird shoot of the club, held to-day at Dexter Park. Henry Knobel, Jr., won the club badge with the only straight score. Ex-Judge James B. Voorhees was second with 6. The fact that only 2 out of the 12 shooters could score better than 5 out of 7 speaks volumes for the quality of the birds supplied to the club. Scores:

H Knobel, Jr (30)	1211221—7	Dr Raynor (26)	2021210—5
J B Voorhees (29)	2012222—6	H McLaughlin (27)	0002211—4
T Lewis (30)	2220102—5	W Hughes (27)	2000212—4
W Rial (29)	1100112—5	Dr Van Ord (27)	0232001—4
W R Allen (28)	0202222—5	F McLaughlin (27)	2002021—4
J Lotersen (28)	1120210—5	J E Lake (28)	0011001—3

WOODSIDE ROD AND GUN CLUB.

Oct. 7.—The Woodside Rod and Gun Club, of Brooklyn, held its club shoot to-day. The club event is at 7 live birds. J. W. Colgan, J. J. O'Brien and S. P. Schleuter tied for first place with straight scores. On the shoot-off, miss-and-out, Colgan won on the fourth round, scoring 4; O'Brien scored 3 and Schleuter 2. Scores:

James W. Colgan (28) 7, Edward V. Kent (29) 6, Henry P. Smith (26) 5, James J. O'Brien (28) 7, Ulysses V. O'Connor (26) 5, A. J. Henderson (26) 5, James R. Semon (26) 3, James W. Heaney (26) 4, Henry P. Cummings (26) 6, Samuel P. Schleuter (28) 7, Edward S. Morris (26) 6 William H. Hunt (26) 4.

UNKNOWN GUN CLUB.

Oct 3.—The Unknown Gun Club, an organization that is getting to be quite formidable in numbers, met to-day at Dexter Park for its regular monthly live-bird shoot. The club event is at 7 live birds, handicap rise. In this event E A. Vroome and A. C. Rankin tied for first place with straight scores. Below are given the scores of the 21 members who competed in that event:

E A Vroome (28)	2111111—7	Louis Kolb (25)	0101111—5
A C Rankin (23)	2122111—7	Robt Smith (25)	0121220—5
Wm Sands (29)	2202222—6	Richard Tinke (25)	1010120—4
J B Vorhees (27)	1101211—6	John Bohling (26)	0101001—3
A B Jennings (27)	2111022—6	John Vogt (25)	0021001—3
P J Sweeney (27)	1011111—6	John Akhurst (23)	2100010—3
J Knebel (25)	1211102—6	H von Staden (23)	0010101—3
Ed Kane (25)	2101112—6	Wm Quick (23)	1100002—3
M Brown (28)	2011110—5	Ed Hauff (25)	0020020—2
H Boemmermann (28)	1101101—5	Wm Roth (23)	010w
W A Skidmore (25)	1201220—5		

THE CUCKOOS AT ROCKAWAY PARK.

Oct. 9.—A few members of the Cuckoo Social Club, of Rockaway Park, together with some friends, opened the trap-shooting season at the club's grounds this afternoon. Eddie Bourke, the captain of the club, was on hand, and with his inimitable good humor, together with his capacity for executive work, kept the boys shooting until it was time to take the train for the city or stop all night at Rockaway Park. Five events were shot, the first being at 15 targets "for love." The next was a 50-target handicap, an allowance of misses as breaks being awarded the less expert shots. In this event Edwards was placed at scratch, the others receiving the following allowances of misses as breaks: Lewis 1, Dudley 2, Heyer 8, Bernard and Law 10, E. Bourke and Stone 12, Coleman 13 and Jones 15. These figures, added to the totals in the table below, give first money to Lewis with 46, second money to Law and Heyer with 43, and third money to Dudley with 42.

The third event was similar in conditions to the above. The handicaps were revised as follows: Edwards and Lewis, scratch; Dudley 2, Heyer 7, Law 9, E. Bourke 13, Bernard 14, Coleman 20. With his handicap Bourke won first money with a total of 46; Edwards and Law divided second with 45; Lewis and Bernard third with 43. Scores in all events were as below, each event being at unknown angles:

Events:	1	2	3	4	5			
Targets:	*15*	*50*	*50*	*25*	*25*	Shot at.	Broke.	Av.
T Lewis	13	45	43	..	..	115	101	87.8
Edwards	14	41	45	21	24	165	145	87.8
W Bernard	6	28	29	10	20	165	93	56.3

F Coleman	9	19	17	..	..	115	45	39.1
J Jones	..	26	..	..	..	50	26	52

NEW UTRECHT GUN CLUB.

Oct. 10.—Only six members of the New Utrecht Gun Club put in an appearance at the Dyker Meadow grounds this afternoon. Donley Deacon did some good shooting, winning the Hegeman badge with 15 straight and the club shoot also after a shoot-off with M. Van Brunt. In that shoot both Deacon and Van Brunt scored 23 each; shooting off the tie Deacon broke 24 to Van Brunt's 22. Scores:

	Club Shoot.	Hegeman Badge.
D Deacon (A)	11101011111111111111111—23	111111111111111—15

G. E. POOL, Sec'y.

Dr. Tiffany's Powder.

THE following letter from the American E. C. Powder Co. was received too late for publication in our issue of Oct. 10. In his answer to Dr. Tiffany's communication, in our issue of Oct. 3, the secretary of the E. C. Powder Co., Noel E. Money, quotes from two letters, the originals of which he incloses for our perusal. Mr. Money's letter is as follows:

OAKLAND, Bergen County, N. J., Oct. 5.—*Editor Forest and Stream:* Dr. Tiffany begins by quoting a proverb about lies, but fails to point out where any lie comes in in our letter.

We inclose Dr. Tiffany's first letter of Aug. 12, where he says in substance that if we will kindly send him a can of powder he will introduce it to the members of his gun club if he likes it, and then enumerates his powers as a shooter and "introducer" of powder; but there is nothing about "ordering in quantity."

This bleeding of the manufacturer and the sportsmen's newspaper by puffing or condemning goods over a *nom de plume* has gone on long enough.

Dr. Tiffany calls it a "legitimate business transaction," for reasons which are rubbish, when he says: "Few trap shots buy a new nitro until they have a chance to try it." If that were the case, trap shots would indeed be fortunate, for with the number of new nitros that have come out during the last two years they could get enough powder for nothing to last them the season; Dr. Tiffany is wrong there, for most amateur trap shots prefer to pay for what they use. If Dr. Tiffany carries out this rule with equal success at drug stores, he could get enough medicine to last his lifetime, and ought never to pay for anything at all except beef and mutton, which are not manufactured in new grades at present.

We must congratulate Dr. Tiffany on his success as a powder puffer and trust that he will not give "E. C." many black eyes over his *nom de plume* when he next writes powder articles.

THE AMERICAN "E. C." POWDER CO., LTD.
NOEL E. MONEY, Sec'y.

As a matter of fact, Dr. Tiffany's principles in regard to the testing of new powders would, if carried into other lines as suggested by Mr. Money, lead to something entirely new and profitable to all consumers, but equally unprofitable to manufacturers. For instance, Huyler receives a note in his mail to the following effect:

"Dear Sir—Please send me a box of your best candies. I have never tried them, but am willing to give them a test. I have considerable standing at church sociables, and will, if suited, be able to do you much good and probably will be able to send you orders for candy in quantity later. Yours truly," etc.

A similar letter reaches Horton, asking for ice cream. Both letters of course are considered favorably, and the recipient has a free blow-out with results that necessitate the instant dispatch of the following note to the nearest drug store: "Please give bearer a box of your best pills. If I find on trial that they are all you represent them to be, I shall be glad to recommend them to my friends, and will unquestionably, owing to my social and political standing, be able to do you much good, and in all probability will be sending you orders for pills in bulk before long. Yours truly," etc.

In a day or two the same drug store receives a note to the following effect: "Please give bearer at once some plasters suitable for stomach trouble. Your pills were everything you said they were, and I have been able to give them favorable mention when speaking of my present trouble to my friends and family. If your plasters prove half as satisfactory as your pills, you will have no cause to complain of lack of advertisement and pecuniary benefit through neglect of mine. Yours truly," etc.

Suppose that "Yours truly" does not get the better of his attack, but succumbs to the inevitable. Caskets and tombstones might be obtained by the stricken family on the same lines as "new nitros" are said to be obtained by trap shots. "Orders for caskets in quantity if the sample sent is satisfactory" would make an undertaker smile—something he should never do.

But Dr. Tiffany seems to ignore, or to be unconscious of, the fact that to send in an advertisement to a journal under the guise of a public communication is a deception. That it is, in short, a dishonest action. Without any reference to any one in particular, we know such things have been done, and it always impressed us as a peculiar phase of such transactions that to the principals it seemed all right that a man should, under a deception, work off an advertisement and collect the remuneration therefor.

The other gentlemen to whom Dr. Tiffany would recommend the powder between times, when not busily engaged using samples, have just as good right to ask for samples as he has; *ergo*—all men have a right to ask for samples.

A consideration of the depths into which this "sample" idea might lead us induces us to break off the point of our pencil and quit work.

In the report of the Cambridge, Vt., tournament which appeared in our issue of Oct. 10, an error was made in the total of breaks made by Mr. E. A. Worthen, of Burlington, Vt. The scores show 61 breaks, not 55. Mr. Ellsworth asks us to make the above correction.

Pawtuxet Gun Club.

PAWTUXET, R. I., Oct. 1.—The following scores show the result of the last eight weeks' shooting of the Pawtuxet Gun Club, and practically winds up the trap-shooting around here until next year, when we confidently expect to see a better trap-shooting season than we have had here in twelve years, although we are barred from shooting live birds in this State.

Eight weekly shoots for 12 Frost shooting scenes, 25 targets, unknown angles; best 4 to win; 2 classes, 3 prizes in each:

Class A.	Aug. 8.	Aug. 15.	Aug. 22.	Aug. 29.	Sept. 5.	Sept. 12.	Sept. 19.	Sept. 26.	Total.

The club will hold an all-day shoot on Thanksgiving Day.

W. H. S.

The Newburgh Tournament.

THE annual fall tournament of the West Newburgh Gun and Rifle Association, of Newburgh, N. Y., was held Oct. 7-9. The club was favored by excellent weather for the time of year. The air breathed at the grounds, about two miles out of the city, had in it a touch of the woods that made one's thought turn at once to ruffed grouse and woodcock. It is quite likely that the open season on these birds did something toward keeping down the attendance. Nobody should be blamed for preferring a day in the woods with a good dog to a day's sport at the traps with either inanimates or live birds.

On the subject of the attendance at this shoot, something should be said as to how the "professionals barred" clause in the programme worked. Running over the list of names in the tables of scores given below, it is hard to find any new ones; they are all, or nearly all, regular habitues of the Newburgh tournaments, and come there to shoot twice a year, spring and fall, just as regularly as the canvasbacks make their trips north and south at the same seasons of the year. Outside of L. V. Byer and Dr. Weller, of Rochester, and, we believe, Mr. Cutler, the names of those who shot on the first day in any number of events are names of shooters whose faces are as well known at tournaments on the Newburgh grounds as those of David Brown, the president of the club, and George "Boxer" Taggart, the referee, whose size precludes any idea of disputing his decision.

On the other hand, where were Glover and E. D. Fulford, Jim Elliott, Bartlett and Van Dyke? The "professionals barred" clause can be quoted as reason enough for their absence. Heikes was there on both days, making many new friends and cementing old ties by shooting through the entire programme of 400 targets without the shadow of a chance of coming out a cent to the good, but on the contrary of paying $2 per hundred for his targets. The latter expense he was not put to, the club inviting Heikes to break as many targets as he could out of the 400, without a cent being taken from him for those targets. Jack Winston came up on the second day, but rather late, and shot along "for birds" in the balance of the events undecided when he came on the grounds.

The Rose system of dividing purses was used, and gave the most thorough satisfaction. It has come to stay in this section of the country, and will, if given a fair trial, always come out on top. President Brown of course acted as cashier and paid out the moneys as promptly as ever. In speaking about the Rose system Mr. Brown said that it was so much easier to figure out the purses under that system than under the old one that he hoped never to have to tackle the old one again. On a hook in front of his desk in the cashier's office hung a copy of FOREST AND STREAM of July 11, well thumbed, but still in the ring. It was opened at the page on which is given in full the only description of the workings of the Rose system, with an example, that has ever been given in the columns of any sporting paper. "That's what makes it so easy," said Mr. Brown, pointing to the page above mentioned. The assistant cashier, entry clerk, squad hustler, etc., was Jack Rogers, of the staff of the *American Angler*, familiarly called Whiskers by his chief, Dave Brown. The scoring, pulling and refereeing was divided up among many hands, and it was only right that it should have been done that way, as it was far too cold to ask one man to stand out all day and perform any one of the duties referred to. The trappers of the club are a first-class set of men, active, strong and well able to take care of the traps; under the leadership of Gil they kept the empire traps and targets going fast enough to please everybody. Balks were nothing like as numerous as we have often seen them at small tournaments.

The catering of Jake Gedney was nothing new. Mr. Gedney never gave one of his guests a poor meal; he has a rule that the best is none too good for them, and he acts up to that rule in a manner that puts to shame nine out of every ten men who cater for trap-shooters at tournaments. A good pair to draw to would be Jake Gedney, of Gedney's Hotel, and Nate Astfalk, of Oakwood Inn, Elizabeth, N. J.; we could easily make it "trips" by adding Charlie Zwirlein, of Yardville, N. J., to the above pair.

Among those present at the shoot were: Rolla O. Heikes, of the Winchester Repeating Arms Company; Ed Taylor, of Laflin & Rand Powder Company; Mrs. M. F. (Wanda) Lindsley, of the King's Smokeless Powder; Justus von Lengerke, of Von Lengerke & Detmold, the U. S. agents for Schultze; J. L. Lequin, secretary of the Hazard Powder Company; John L. Winston, representing the Austin Powder Company, of Cleveland, O.; J. A. H. Dressel, of the U. M. C. Company, and of Bartley & Graham's, New York City; U. M. C. Thomas, the Union Metallic Cartridge Company's expert, of Bridgeport, Conn.; W. L. Colville, who, under the name of Dick Swiveller, showed the boys that he could make a straight or two with Gold Dust, etc. The lay brethren were represented by J. T. Mascroft and V. D. Kenerson, members of the Worcester, Mass., Sportsmen's Club; L. V. Byer and Dr. Weller, of Rochester, N. Y.; J. Ogde , of Warwick, N. Y.; Dr. Mason and John B. Halsted, of Peekskill, N. Y.; L. H. Schortemeier, of New York City; Arnold, of Albany; M. F. Roberts, M. H. Clark; C. F. Lenone, of Passaic, N. J., etc. The home club was represented by Jas. F. Taylor, W. M. Stanbrough, G. H. Wood, captain of the club; Dickson, Harry Higginson, Billy Gibbs, Rogers, Rhodes, etc.

As to the success of the shoot there can be only one thing said: Of its kind it was as nice a shoot as anyone ever went to. There was any amount of shooting, plenty of good-fellowship, no kicking and everyone given a show for his white alley. We believe, however, that we can safely make the following prediction: Future tournaments of the Newburgh Club will be "open to all," with the Rose system of dividing purses in all events. "Barring professionals" can scarcely be said to have been a success in point of drawing out more shooters of lower caliber; this, of course, only applies to tournaments the size of this one at Newburgh. How the scheme would work in a large tournament, with plenty of added money, it is hard to say. An actual trial on that basis would have to be made before a definite answer could be given.

Ed Taylor gave the club a pleasant surprise when he arrived on the grounds on Wednesday morning. Unpacking two small cases, he produced a couple of drums of Laflin & Rand's W-A powder; the drums were silver-plated and bore the well-known Laflin & Rand wreath surrounding the letters "W-A," presenting a very tasteful appearance and making a nice souvenir to take home from the shoot. Mr. Taylor announced that his company would donate one of the drums each day to the shooter making the highest average in all programme events, Rolla Heikes barred. No shooter could win both drums. James Taylor, of the home club, carried off the trophy on the first day; Byer working hard for the second drum on the next day, and succeeding in taking it home to Rochester, winning it by a margin of four targets.

The club gave $50 in average money, the above sum being divided into six moneys as follows: $18, $11, $8, $7, $6 and $5. As it happened, only six men shot through the entire programme of 400 targets, consequently the $50 went to them, their records being as below:

	1st Day.	2d Day.	T'l.		1st Day.	2d Day.	T'l.
J F Taylor	182	177	359	W Stanbrough	169	164	333
Edwards	177	171	348	G H Wood	158	150	308
L V Byer	167	175	342	M H Clark	152	154	306

The percentages of the above six shooters were: 89.7, 87, 85.5, 84.2, 77, and 76.5 respectively.

Heikes made a general average of 89.5, breaking 358 out of his 400. It is only fair to state that he was shooting a strange gun, one that was entirely different from his old favorite, now so well known to the boys, and one that bothered him a good deal in the matter of trigger pull. Each day's scores follow:

First Day, Oct. 7.

The heavy rain that fell during the night, or rather during the early morning hours of to-day, cleared the atmosphere and made the scenery that surrounds Newburgh even more beautiful than usual. There was enough force in the wind to make the targets hard to get on to all the time. Standing at the score, it was difficult to realize just how strong the wind was blowing; in addition to this it was fitful; at some times it would swoop down and send the targets off down wind like scared teal; then again it would die away and no better chances for a good score could be asked for.

J. S. Taylor, of the home club, won the handsome prize donated by the Laflin & Rand Powder Company to the shooter making the highest average in all the programme events. He shot consistently well during the day and finished with the excellent total (all conditions considered) of 182 out of 200 shot at. Edwards was second, 5 targets behind, while Heikes, who shot a strange gun and who had very little incentive to "get down to his knitting," was third with 88 per cent. It is hard to say just what average Heikes would have made had he had Old Betsy at his shoulder every time he called "pull." His presence at the shoot, where he could not possibly win anything, being barred from all events, and his shooting along with the boys through the programme, made many more friends for him than he probably realizes. The scores to-day were as below, Nos. 1, 4 and 8 being at known angles; the balance at unknown angles:

FIRST DAY'S SCORES.

Events:	1	2	3	4	5	6	7	8	9	10	Shot at.	Broke.	Av.

Cramer	..	..	..	11	..	..	..	10	..	..	40	21	52.5

J. Rogers shot in No. 10 and scored 10 out of 20.

Including 5 extra events at 10 targets, each a total of 3,440 targets were thrown during the day.

Second Day, Oct. 8.

There was a snap to the morning air to-day that made it very pleasant to find a sunny nook out of the wind, so that one could sit outside the club house without feeling that there was a possibility of freezing to death. The colors of the autumn foliage that shone brightly in the sunlight made more than one of the shooters fall a victim to the "woods fever." Everything spoke eloquently of ruffed grouse.

The starting of the shoot to-day was a late one, too late for this season of the year, when one cannot see a target leave the traps after 5:30 P. M. The programme was only just completed when night fell, and those who shot in the extra 10 target event gotten up at the close of the programme did a lot of guessing as to when a target left the trap and as to where it went when it did go.

Justus von Lengerke, J. L. Winston and L. H. Schortemeier arrived on the scene when the programme was nearly half shot through. Von Lengerke gave a good account of the 120 targets he shot at, beating "147" by 1 target and Schortemeier by 3. "147" shot as an expert, and only entered the events he shot in "for the birds." Heikes, who again shot through the programme "for birds," was high for the day with 91 per cent. James Taylor was next to him in all programme events, Byer being third. The latter won the Laflin & Rand prize, Taylor being barred, as he won it on the previous day.

U. M. C. Thomas was taken sick to-day in the first event, and was forced to drop out of the shoot. Besides the 26 names which appear in the table given below, Blauvelt shot in No. 4, scoring 9 out of 20, and Rogers shot in No. 5, making 10. Events Nos. 1, 4 and 8 were at known angles, all the others were at unknown angles.

SECOND DAY'S SCORES.

Events:	1	2	3	4	5	6	7	8	9	10	Shot at.	Broke.	Av.

Third Day, Oct. 9.

There was not a large entry list in any one event, yet 18 shooters in all took part in one or other of the three programme events. Jas. S. Taylor, of the home club, kept up the good record he made the past two days on targets, making clean scores in all the above events and scoring during the day only 3 lost out of 54 shot at. The wind was unfavorable for the birds, blowing directly from the traps to the score. Scores in the programme events were:

	No. 1.	No. 2.	No. 3.

EDWARD BANKS.

At Baltimore.

DURING the past week there has been a good deal of shooting on the grounds of the Baltimore Shooting Association. All events have been at live birds, and some interesting matches have been witnessed. The first event of the kind to be noticed is

THE ELLIOTT-CLARIDGE MATCH.

This match was shot on Monday, Oct. 5. The following extract from the Baltimore *Sun* of Oct. 6 tells the story:

"The sport at the Baltimore Shooting Association's grounds yesterday, which was introductory to the club tournament beginning today, had as its main attraction the match between the handicap champion, Bertram W. Claridge, possessor of the Du Pont trophy, and J. A. R. Elliott, the crack shot of Kansas City. A number of miss-and-out events were shot by the assembled marksmen.

"The wind blew from the shooters toward the traps, thus having a tendency to carry the pigeons away from the guns. The birds were only a fair lot of flyers, and the lucky men got easy ones.

"The Claridge-Elliott match was for $50 a side at 50 birds each, Claridge to shoot from the 28yds. mark and Elliott at 30yds. Elliott was a favorite in the betting before the race, though little betting was done.

"Elliott used a single-barrel repeating gun and won the match, killing 49 out of 50 shot at. Claridge used a double-barrel gun and killed 47 birds.

"Elliott missed his 2d bird, a right-quartering driver. Claridge missed his 1st bird, a slow-flying right-quartering bird. He also missed his 29th and his 40th birds. Claridge had possibly the hardest birds to shoot at. He killed the very hardest and lost the match on the 'duffers.'

"When the match was made Elliott was visiting friends in Easton, Talbot county, Md., and was a guest of his brother, J. M. Elliott, who, with Dal Hayward, Edward Hardcastle, Harry Covington, A. L. Pascault and others, came across the bay to see the match. They will take a few dollars back with them if they do not get on the wrong end to-day and to-morrow.

"In the sweepstakes of the day, all miss-and-outs, at $2 entrance, the moneys were divided. Among those who shot were: Smith, Claridge, Elliott, Macalester, Hawkins, McComas, Jones, Bonday, Sims, Simon, Johnson, Howard, Franklin, James, Brewer and Clark.

"The tournament proper will begin this morning, and the Claridge-Malone race for the Du Pont cup will take place this afternoon. Much interest centers in the first challenge issued to the present holder of the cup."

CLARIDGE-MALONE MATCH.

The next event in order of sequence, though more important in fact, is the match shot on Oct. 6 between Claridge and J. R. Malone, captain of the Baltimore Shooting Association, for the Du Pont trophy. It will be remembered that Malone challenged Claridge for the trophy immediately after the latter's victory at the Du Pont shoot in Chicago last August. The match itself, outside of the final result, did not give much cause for any excitement; Claridge took the lead in the first round, and was never in any danger of losing it. He shot well, centering his birds, and running out an easy winner by 47 to 43. As soon as the match was over J. L. Winston, who shoots under the name of 147, challenged the winner of the Claridge-Roll match for the trophy, George Roll, of Blue Island, Ill., being next on the list to challenge for the trophy.

The full score of to-day's match, with the number of trap and the direction of each bird's flight, is given below:

Trap score type—Copyright, 1896, by Forest and Stream Publishing Co.

```

The shoot ended on Oct. 7. On this day there were eleven events decided. The first was at 7 birds, $7, three high guns; this event resulted in Phil Daly, Jr., and C. A. Macalester dividing first and second moneys, Brewer and Malone cutting up third money. There were ten entries in the event. The other ten events, which were all $2 miss-and-outs, resulted as follows:

No. 1 was won by Claridge, Brewer and Malone, with 7 straight.
No. 2 was won by Cubberly, Winston and Thurman, with 7 each.
No. 3 was won by Winston, Elliott, Cubberly and Thurman, with 7 each.
No. 4 was won by Hayward, Cubberly and Brewer, with 10 each.
No. 5 was won by Claridge, Brewer and Cubberly, with 7 each.
No. 6 was won by Macalester with 4.
No. 7 was won by Simon and Hood, with 8 each.
No. 8 was won by Simon, Macalester and Sims, with 5 each.
No. 9 was won by Thurman and Howard, with 10 each.
No. 10 was won by Thurman and Howard, with 6 each.

Calumet Heights Gun Club.

CHICAGO, Ill., Oct. 3.—The weather was bright and clear to-day, with a light south wind blowing. In the trophy contest Paterson won in class A, Metcalf in class B and Wilde in class C, the latter having no competitor. Scores:

No. 2, 10 targets, unknown traps and angles: Paterson 9, Booth 8, Norcom, Metcalfe and Hawkins 6, Lamphere and Marshall 5, Greeley 2.

No. 3, snipe shooting, 10 targets: Booth 9, Metcalfe 8, Paterson and Greeley 7, Norcom, Hawkins and Marshall 6.

PATTY.

ANSWERS TO CORRESPONDENTS.

A. H. W., Turkey, N. Y.—No new powder tests like those by Armin Tenner have been conducted.

C. F. W., Atkinson, N. H.—1. Is a whippoorwill and a night hawk one and the same bird? 2. Do male deer and elk shed their horns annually? Ans. 1. No, though they are somewhat similar in appearance. 2. Yes.

H. H., Brooklyn, N. Y.—Please tell me a good place for fishing from the shore near New York for flounders, tomcods and striped bass. Is Spuyten Duyvil good for striped bass or flounders? Ans. Spuyten Duyvil is considered but a moderately good place. Also try the sod banks on the south shore of Staten Island.

PUBLISHERS' DEPARTMENT.

Remington Arms Co.

THE following letters are self-explanatory:

OFFICE OF THE WINCHESTER REPEATING ARMS CO., NEW HAVEN, Conn., Oct. 1.—Dear Sir: We desire to inform you that we have sold our entire interest in the Remington Arms Co., of Ilion, N. Y., to Messrs. Hartley & Graham, of New York city. Yours respectfully,

WINCHESTER REPEATING ARMS CO.

OFFICE OF HARTLEY & GRAHAM, NEW YORK, Oct. 1.—Dear Sir: Referring to the above letter of our friends, the Winchester Repeating Arms Co., we take this occasion to inform you that the business of the Remington Arms Co. will continue as heretofore, but under our sole management and control. Yours respectfully,

HARTLEY & GRAHAM.

All about Texas.

IF you wish to receive a 200-page handsomely illustrated book, telling all about Texas and her advantages, send 7 cents postage to D. C. Price, A. G. P. A., I. & G. N. R. R., Palestine, Texas, and the book will be sent to you by return mail. Texas is now attracting a large number of settlers by reason of her cheap lands and mild climate. You will not regret the amount. When writing mention this paper.—*Adv.*

NEW YORK LIFE BUILDING

Present Entrance on Leonard Street

The reproductions are to me most satisfactory; they lack color, of course, but in every other respect are the best we have ever seen, and I think I may say that those of the Audubon family still remaining are much gratified with the first of the series. M. R. AUDUBON.

AUDUBON BIRD PLATES.

THE first subject of the series of half-tone copies of Audubon's famous bird portraits was that of the Black Duck, in the issue of Sept. 26. The second one, the Prairie Chicken (pinnated grouse), is given to-day. Others which will follow on dates to be announced are:

SHOVELLER DUCK.
REDHEAD DUCK.
CANVASBACK DUCK.
AMERICAN WHITE-FRONTED GOOSE.
PURPLE SANDPIPER.
AMERICAN GOLDEN PLOVER.
WILLOW PTARMIGAN.

The illustration pictures the combat of two rivals for the possession of a hen, as described in the text; it is one of those incidents in bird life which Audubon had noted in his close and patient study during the many years spent in the wilderness. In keeping with Audubon's practice in his bird plates, the illustration is more than a mere portrait of the birds depicted; it gives us a picture of the prairie chicken country "of our original Western meadows," and there is a drawing of the tiger lily. Audubon's great work is thus rich in delineations of natural scenery, trees, and shrubs and flowers, for it was always his aim to show not only the bird, but its surroundings.

Hardly less interesting than the illustration is the naturalist's written account of the ways of the prairie chicken as he had observed them; and very suggestive too are his notes upon the disappearance of the bird from Kentucky. Even so early as his time the work of destruction had been begun, with a force and rapidity which were significant of the extermination which was to be wrought within the century.

Audubon writes of the prairie chicken and the heath hen as the same bird, although they have since been classed as distinct forms. The heath hen, which in his day was common in the Eastern States, has been obliterated save for that remnant on Martha's Vineyard of which recent numbers of the FOREST AND STREAM have contained some notes. The spring and summer shooting "by persons such as in England are called poachers" has long since done its perfect work. No fact impresses itself more constantly and forcibly upon the reader of Audubon's volumes than his accounts of former abundance and reports of the diminution of the game bird supply, which was proceeding at such a startling rate even in his day, and he lived in a time which we are disposed to regard as the golden age of American game. The contrast between that time and this is brought out with startling distinctness, when these chapters which he has written and the facts recorded therein are compared with the conditions which exist in our experience at this day. The Audubon who wrote in the early decade of the nineteenth century would be an impossible personage in these closing years of the same century. An Audubon of to-day might possess equal enthusiasm and devotion and skill; but the rich abundance of material for his study has long since passed away, and with the meager supply remaining he could neither draw the pictures nor write the chapters which should charm the world as have these. Audubon, the ornithologist and artist, was one of the rich gifts of his time to the generations which have followed. It should be to us an occasion of abiding gratitude that such a man was found, while the opportunities were yet afforded, to depict with pen and pencil the birds of the continent.

YELLOWSTONE PARK ENLARGEMENT.

THE proposition to enlarge the Yellowstone National Park, brought forward by Mr. Cowan's letter, printed in another column, ought to receive the support of every one really interested in this National preserve. A good many years ago such enlargement was advocated by the FOREST AND STREAM—at a time indeed when very few people knew much about the Yellowstone Park, and long before its buffalo had been destroyed or its mountains burned over. At that time nothing was done, for the Park had but few friends in Congress, though those few were earnest and untiring. Only a few years ago the Park was practically enlarged on the east, and to some extent on the south, by the establishment of the Yellowstone Park Forest Reservation, which the Secretary of the Interior put in charge of the Superintendent of the Park. The upper part of the Jackson's Hole country so far south as to include the southernmost of the Tetons ought to be within the Park, and the same may be said of much of the country on the west as far as Henry' Lake. Much of this region contains surpassingly fine scenery, and it is all of it a natural range for game. As Mr. Cowan suggests, the extension of the Park would protect the few remaining buffalo ranging on the borders of the Park or in eastern Idaho. The matter, however, is one that ought to be taken up by the residents of the States adjoining the Park. No portion of our people have so real an interest in the Reservation as those who live about it. It is to their interest more than to that of the people of any other section to protect it and all that it contains. We have little doubt that the time will come before very long when such an enlargement will be made, and the sooner it comes the better for all of us. We urge Mr. Cowan to endeavor to interest the people of his own section in this subject, and assure him that there will be hearty and earnest support for such a project among those best qualified to express an opinion about the matter.

This is something which, if to be done at all, should be done quickly, for every year adds to the obstacles which stand in the way; more settlers are moving in, and with them antagonistic interests are growing; the game range is narrowing, a vast area has been ruined this year by the sheep men taking their herds over the new trail; and so in one way and another the park scheme is being hampered with new embarrassments.

FLUCTUATIONS OF THE GAME SUPPLY.

REPORTS from different sections of the United States and Canada indicate that quail, ruffed grouse, ducks and other birds dear to the sportsman's heart are in greater abundance this year than they have been in several years, though as a matter of course, owing to local advantages and disadvantages, some sections are more favored than are others in this abundance.

And in this abundance the sportsman will find much cause for rejoicing; in it the alarmist, who, when his forebodings are excited in the years of dearth and who is then impelled to foretell the quick extermination of all game, will find much in refutation of his teachings, since there seem to be years of abundance and years of dearth alternating at irregular periods, independently of the destruction caused by man.

The shooting in each year may be accepted as a constant factor in bird destruction. Yet the quantity of birds killed by sportsmen in any one year and the birds left to breed are very imperfect data from which to estimate the next year's game supply. Shooting of course lessens the birds' numbers, but the extent of the shooting does not explain the fluctuating abundance of one year and the dearth of another.

There are laws governing the propagation of animal life of which we know but little. We may explain that the season was a good breeding season for birds because it was dry and that the eggs or birds thereby escaped destruction from wet, but that does not explain the cause, because a dry season does not always produce an abundance of birds. A coincidence is often mistaken for a cause. In some wet seasons game birds are abundant, though if it be too wet in the nesting season many eggs and young birds may be destroyed.

Above all conditions of weather, in the consideration of abundance and scarcity, is the astonishing fertility which a species may exhibit at the beginning of a season, regardless of weather conditions. In the whole length and breadth of the continent this fertility may be uniform while the weather and climatic conditions are distinctly different and variable.

Why there should be this natural impulse toward a rapid multiplication of a species in one season, and extraordinary fertility and a loss or moderate gain in numbers in other seasons, is a matter of speculation.

This intermittent manner of reproduction is not confined to the animal world. No farmer counts on growing a good crop of wheat, or cotton, or corn, etc., each year; yet in certain years, in sections widely distinct in climate, soil and weather conditions, there will be general abundance of a certain crop and a flooded market. The farmer explains that the season was wet or dry, according to which is coincident, but that in no wise explains why there should be the universal natural impulse, at the outset of a season, toward the unusual multiplication of a species, though it may coincidently affect multiplication for better or worse.

This of course is considering species in a general way. There may be local conditions in certain sections which affect the local game supply, as there may be too many persistent gunners in a locality who exterminate its game; or the ground in a certain locality may have so little watershed that a heavy rain will drown or drive out all small animal life, as it may man and beast if the overflow becomes too great, but special local conditions do not affect the great whole.

Many men, earnest in game protection, see but one cause for the scarcity of birds, and that is the gun and dog. That is a cause and should be governed by wise restrictions, as it legally is in most States, but it is but one cause of many, and of these there are some concerning which sportsmen can only speculate with such philosophy as they may have.

SNAP SHOTS.

Among those who have been mentioned as possibly to succeed the late Dr. Goode as Assistant-Secretary of the Smithsonian Institution in charge of the National Museum are President Jordan, of the Leland Stanford University; Dr. C. Hart Merriam, ornithologist of the Agricultural Department, and F. W. True, curator of mammals, and now in temporary charge of the museum. The appointment will probably be made in January.

Given a camp site set amid scenery of inspiring loveliness, a camp equipped with all that heart could ask for, waters full of magnificent fish, camp equipment, fishing tackle—every material thing that an angler could ask for to make certain the success and pleasure of a woods vacation—and could he enjoy it all if won at the cost of conscience? An useless by speculative question, you say. Not a bit of it. A direct and practical question it was for one angler in Massachusetts not long ago. This fisherman was a member of a school text-book committee; and there came to him an opportunity to win a fishing trip to Vermont, with all expenses paid, if he would give his vote in the board for the adoption of a particular text-book. He did not accept the proposition. If he had earned his vacation in this manner, would he have found any satisfaction whatever in it, even if he had caught more fish and bigger fish than ever in his whole life before?

The constitution of New York forbids absolutely the disposal of any of the forest lands now owned by the State. For the purpose of exchanging certain pieces of State lands outside of the Adirondack Park limits for other pieces within the limits, but owned by private holders, it is proposed to modify the constitution by an amendment authorizing such exchanges. The question will be voted upon at the coming election. The Genesee Valley Forestry Association, of Rochester, has given voice to its opinion in resolutions declaring that it regards the proposed amendment as inopportune and fraught with danger to the forests of the State; and that the existing provisions of the constitution relating to forestry should not be changed until the forests of the State can be placed under expert forestry administration.

AUDUBON'S PORTRAIT OF THE PRAIRIE CHICKEN.

The Sportsman Tourist.

CAMP SIXTEEN.

At the foot of what is known as the Sixteen-Mile Level of the St. Regis River, near Spring Cove, N. Y., is located a permanent camp, consisting of two substantial log houses, well roofed and lighted, and fitted up with enough conveniences to insure the pleasures of camp life without its discomforts. It is the center of a region famous for deer, and friends of mine who had just vacated this camp had killed five. Having failed as yet to bring in any meat, we had left Camp Saints' Rest, as chronicled in a previous paper, and transferred our duffle to this spot.

About a mile below the camp there is another short level, on which, so far as I know, no boat had ever floated, and as the signs of deer were plentiful here we decided to give the longer level a rest, and put our Saranac boat on this one. The trail was fairly good, and Martin's tough muscles made light work of getting our craft to this quiet bit of water, where we intended to jack that night. Thus far we had confined ourselves almost exclusively to still-hunting, but with the end of our vacation near at hand, no meat in camp and the possibility of a blank score staring us in the face, things seemed sufficiently serious to warrant us in taking all the chances there were. We paddled up the winding river for the purpose of studying geography a little, when, on rounding a turn, we came to a big fallen spruce whose roots were imbedded in one side of the river and whose top lay in the bushes on the other side. Here was a serious barrier to our proposed night hunting; but necessity is said to be a near relative of invention, and after putting half a dozen .44 bullets through the trunk a few feet from the shore we were enabled to break off the top and make space enough for the boat to run past. Then we took the rifles and went still-hunting, intending to return after dark and run the level. But fate had decreed otherwise, for at dusk the flood gates of heaven were thrown wide open, and Jupiter Pluvius was the only one who fired any guns that night.

The next day we pulled the boat up through the rapids to the Sixteen-Mile Level, caught a fine mess of trout, harvested some frogs' legs, cut some firewood, and prepared for the night's work. I say "work," because jacking comes pretty near being that. It is a novel and exciting experience—especially for the beginner—and there is a weird beauty and strangeness about the woods and waters at night which one sees at no other time; but to sit motionless for hours in a boat with no back to the seat you occupy, to go through all the incipient stages of curvature of the spine, to feel the jack gradually taking on weight until you suspect that your backbone will ultimately be driven through the bottom of the boat; and, above all, to feel the cold night air soak through your clothes and clutch your very marrow—these are the things which the man who jacks will recognize as akin to work. Nevertheless we went jacking. Salt pork is good fare for a week or more, but after that venison tastes good.

It wasn't Martin's fault that we neither saw nor heard a deer that night, for his paddle was as silent as the grave, and we covered a good many miles before we finally started homeward in the small hours of the morning. A gentleman from the West—Beecher by name—with his guide, Wes. Davis, was also hunting the river that night, and we had heard a shot from him, fired, as we afterward learned, at a big buck that is still roaming the woods unharmed. As we neared the foot of the level this party came down behind us, and the slight sound of Davis's paddle caused both Martin and me to turn at the same moment and look backward. Then a funny thing happened—that is to say, it strikes me *now* as being funny! The cranky Saranac boat, which possesses all the merits and the one fault of the best boats made, responded to our simultaneous movement with uncalled-for suddenness and startling results. Martin and I had been thinking for a day or two that we needed a bath, so we took one then and there. I do not, as a rule, wear a jack on my head when I bathe, and I am not addicted to the habit of diving with a gun in my hand and with heavy clothes and wading boots on; but it suddenly occurred to me that these were eminently proper things to do, and Martin seemed to coincide with my views. If either of us hesitated about going overboard, the other didn't notice it. We had been working in concert for two weeks, and there seemed no good reason why we shouldn't act together now. Besides, we were cold, and the water was warmer than the air. For these and other good and sufficient reasons we vacated the boat.

Although our mishap was plainly visible to Beecher and Davis, they made no move to assist us, but commenced telling about the big buck they had missed, as though that information possessed any interest to men overboard in the middle of the night in 15ft. of swift water. Whether their bad luck had warped their judgment, or whether they feared a submarine explosion from the gun I was trying to save, it is hard to say, although they did relieve me of it when I swam to their boat and handed it in. We worked our boat toward the shore, and after getting a foothold righted it and rocked the water out. The seats and paddle were picked up in an eddy below, and we finally got back to camp, shuddering with cold, but none the worse for our accident. Imagine our surprise on taking the cover from the jack to find that it was still lighted, although I had twice been under water with it. So far as I am able to learn, that is the only absolutely waterproof jack in the Adirondacks. There was white frost on our clothes when we got in, but Luques had a good fire going, and we were soon laughing at what might have been a tragedy, but turned out to be merely a comedy. In speaking of the deer he missed, Mr. Beecher said he wished to have it distinctly understood that he came into the woods not to kill deer, but to gather gum!

We then turned our attention once more to still-hunting. Near Camp Sixteen there is a large tract of burnt ground, something more than 1,000 acres, and here the deer come out at dusk to feed, returning to the green timber and the mountains early in the morning. Two or three old log roads and several deer trails run through it, and this burnt ground is one of the best hunting grounds in Franklin county. Luques and Mrs. R. struck in on the north side, and here the former got his first shot at a deer. It was a long and difficult shot, however, and he ailed to hit, much to his disappointment.

Martin and I went into the edge of the green timber on the south side, and just before sundown posted ourselves where we could look over considerable ground. It was almost dark when there was a crackling in the brush, and a small buck and a doe came out of the woods within easy shooting distance from me. These were not the big deer I had been looking for, but this was my last day in the woods and no time for sentiment. Three shots laid both of them down. The first bullet went through the buck's head, the second was a clean miss, and the third went through the doe just back of the shoulder.

By that time it was dark and we were in a nasty piece of country, half a mile from the trail and three miles from camp. We cleaned the deer, made packs of them by slitting the forelegs and thrusting the hind feet through them, slung them on our shoulders and started out. Through bog and brush, over rocks and fallen trees we scrambled, and I was soon reconciled to the fact that the deer I was carrying was not a very large one. Dripping with perspiration, we finally struck the trail. The road through the burnt ground was plain sailing, but the last mile to camp was through thick woods, and the only way we could keep in the trail was by lighting birch bark which we stripped from the trees. It was 10 o'clock when, tired, wet and famished, we saw the welcome glimmer of lights from the camp. But we had gotten what we went after, and a big meal and a smoke soon put us in that blissful state of relaxation which only the tired and successful hunter knows.

The next day I pulled out of camp, leaving Luques and Martin to make one more trial. Luques got a shot at a fine buck and wounded him, but it was then too dark to follow his trail, and a heavy rain during the night washed the signs away and they never found him. A little later Martin paddled Mrs. R. up to a big doe on the river bank, and she succeeded in putting the lead where it would do the most good. With the exception of one large buck this doe was the biggest deer brought in to the hotel up to Sept. 23.

Thus ended our Adirondack outing, and this meager chronicle by no means portrays the pleasures of our experiences among the woods and waters of that glorious country.

The time spent at the primitive little hotel was scarcely less enjoyable than that passed in the woods. Most of the guests were congenial people, and Darwin J. Day, the good-natured and accommodating giant who keeps this place under the shadow of Blue Mountain, has a heart as big as an ox, and not only likes to see people enjoy themselves, but insists that they shall.

From now until next spring we shall feast on reminiscences of the woods, and from then on to the hunting season of '97 we shall indulge in the pleasures of anticipation.

Arthur F. Rice.

TOMAHAWK LAKE.

I had been contemplating a trip to the Tomahawk Lake in northern Wisconsin the past summer, ever since the first appearance of spring had gladdened the heart of the fisherman and naturalist, so that when I received word from my brother B. in Chicago that he had been thinking of the same trip and asking me to accompany him, it was an easy matter to decide. Early in June we started, going to Milwaukee by boat and getting a foretaste of the pleasures to come in the sparkling, blue waters and clear, bracing air. What a relief it was to be away from our routine of office work in the crowded city, those who have experienced can alone tell.

From Milwaukee we traveled to Oconomowoc, that beautiful little watering place, with its sparkling lakes, Fowler and La Belle, their bosoms flecked with picturesque fleets of pleasure craft and waters well stocked with fish, certainly an alluring spot for the tired business man and of easy access.

From here we went to Kilbourn City to visit the world-renowned Dalles of the Wisconsin, of which it has been truly said: "For wild and picturesque scenery they far excel anything else so near to civilization," and while this was considerably off our road yet we felt amply repaid.

Our next stop was at the beautiful island city Minocqua, surrounded by beautiful lakes well stocked with bass of different kinds, pickerel and that magnificent game fish which we were now to "tackle" for the first time, the spotted muscalonge, and well do I remember my first capture as I was trolling from a rapidly propelled boat—the strike, the fight for supremacy and final landing of my captive, which proved to be a handsome 10-pounder; how we held him up and surveyed his shining sides while our heart beat with ecstacy and our pulses bounded with joy; but you all know the symptoms, so why continue. After that it was our pleasure to make several fine catches, but none could take the place of that, our first muscalonge. Doubtless in the years to come we will look back to that pleasant June day on the lake, surrounded by towering forests of pine, the sleepy village nestling on the island and the numerous fishing craft cutting the transparent waters, with the same thrill, and wish for the moment that we were there again with line in hand and landing net ready for the final effort.

We had not yet reached the end of our journey, however; so one morning we took our way northward fifteen miles to the village of Tomahawk Lake. Here we camped out for a few days, and such delightful days as they were seldom come in this busy, toiling world. Lulled to sleep by the dreamy lapping of the waves upon the shore, the soughing of the winds through the dark pines, and the noisy although not altogether unmusical piping of the myriads of frogs, rising with the sun, bathing in the translucent waters, and fishing to our hearts' content. Such appetites as we developed and such capabilities for long wanderings naturalizing and botanizing, and here were good opportunities for each.

The Fourth of July we spent in Minocqua participating in some of the numerous games and observing the sports of the lumbermen, such as log rolling, tub racing, swimming races, etc., and very interesting and novel we found them.

Upon some of our rambles we met with coveys of grouse, composed apparently of the parent birds and their numerous progeny, while along some of the rivers squirrels appeared quite numerous. One morning upon going outside the tent we found a flock of geese circling around the lake, upon other occasions we saw small flocks of summer ducks, and the surrounding marshes were alive with herons, bitterns, red and white-winged blackbirds and rail. The latter were very noisy, and we sometimes amused ourselves by tossing in pebbles and listening to the hoarse cries that arose from the hundreds of startled throats.

At last came the time to return, and with a farewell ramble and a swim in the lake we bade good-bye to our pleasant summer camp and started upon our return down past the rivers filled with floating logs and their accompaniment of loggers, steering pikes in hand, guiding them on their winding way down to their destination—the great lumbering camps; on down till we leave the pines behind us, on and on past lovely lakes, sleepy towns, until the conductor shouts "Milwaukee!" Here we leave the train for another breezy trip down the lake, and so our trip ends.

Chas. K. Muchmore.

Indiana.

Natural History.

THE PINNATED GROUSE.

BY JOHN JAMES AUDUBON.*

It has been my good fortune to study the habits of this species of grouse at a period when, in the district in which I resided, few other birds of any kind were more abundant. I allude to the lower parts of the States of Kentucky, Indiana, Illinois and Missouri. Twenty-five years and more have elapsed since many of the notes to which I now recur were written, and at that period I little imagined that the observations which I recorded should ever be read by any other individuals than those composing my own family, all of whom participated in my admiration of the works of nature.

The Barrens of Kentucky are by no means so sterile as they have sometimes been represented. Their local appellation, however, had so much deceived me, before I traveled over them, that I expected to find nothing but an undulated extent of rocky ground, destitute of vegetation and perforated by numberless caverns. My ideas were soon corrected. I saw the Barrens for the first time in the early days of June, and as I entered them from the skirts of an immense forest I was surprised at the beauty of the prospect before me. Flowers without number, and vieing with each other in their beautiful tints, sprung up amidst the luxuriant grass; the fields, the orchards, and the gardens of the settlers presented an appearance of plenty scarcely anywhere exceeded; the wild fruit trees, having their branches interlaced with grape vines, promised a rich harvest, and at every step I trod on ripe and fragrant strawberries. When I looked around an oak knob rose here and there before me, a charming grove embellished a valley, gently sloping hills stretched out into the distance, while at hand the dark entrance of some cavern attracted my notice, or a bubbling spring gushing forth at my feet seemed to invite me to rest and refresh myself with its cooling waters. The timid deer snuffed the air as it gracefully bounded off, the wild turkey led her young ones in silence among the tall herbage, and the bees bounded from flower to blossom. If I struck the stiff foliage of a black-jack oak, or rustled among the sumacs and brambles, perchance there fluttered before me in dismay the frightened grouse and her cowering brood. The weather was extremely beautiful, and I thought that the Barrens must have been the parts from which Kentucky derived her name of the "Garden of the West."

There it was that, year after year, and each successive season, I studied the habits of the pinnated grouse. It was there that, before sunrise or at the close of day, I heard its curious boomings, witnessed its obstinate battles, watched it during the progress of its courtships, noted its nest and eggs, and followed its young until, fully grown, they betook themselves to their winter quarters.

When I first removed to Kentucky the pinnated grouse were so abundant that they were held in no higher estimation as food than the most common flesh, and no hunter of Kentucky deigned to shoot them. They were, in fact, looked upon with more abhorrence than the crows are at present in Massachusetts and Maine, on account of the mischief they committed among the fruit trees of the orchards during winter, when they fed on their buds, or while in the spring months they picked up the grain in the fields. The farmer's children or those of his negroes were employed to drive them away with rattles from morning to night, and also caught them in pens and traps of various kinds. In those days, during the winter, the grouse would enter the farmyard and feed with the poultry, alight on the houses or walk in the very streets of the villages. I recollect having caught several in a stable at Henderson, where they had followed some wild turkeys. In the course of the same winter a friend of mine, who was fond of practicing rifle shooting, killed upward of forty in one morning, but picked none of them up, so satiated with grouse was he as well as every member of his family. My own servants preferred the fattest flitch of bacon to their flesh, and not unfrequently laid them aside as unfit for cooking.

Such an account may appear strange to you, reader; but what will you think when I tell you that in the same country where twenty-five years ago they could not have been sold at more than one cent apiece scarcely one is now to be found? The grouse have abandoned the State of Kentucky and removed (like the Indians) every season further to the westward, to escape from the murderous white man. In the Eastern States, where some of these birds still exist, game laws have been made for their protection during a certain part of the year, when, after all, few escape to breed the next season. To the westward you must go as far at least as the State of Illinois before you meet with this species of grouse, and there too, as formerly in Kentucky, they are decreasing at a rapid rate. The sportsman of the Eastern States now makes much ado to procure them, and will travel with friends and dogs, and all the paraphernalia of hunting, an hundred miles or more to shoot at most a dozen braces in a fortnight, and when he returns successful to the city the important results are communicated by letter to all concerned. So rare have they become in the markets of Philadelphia, New York and Boston that they sell at from $5 to $10 the pair. An excellent friend of mine, resident in the city of New York, told me that he refused $100 for ten braces, which he had shot on the Pocano Mountains of Pennsylvania.

* From the "Ornithological Biography," Vol. II., Edinburgh, 1834.

On the eastern declivities of our Atlantic coast, the districts in which the pinnated grouse are still to be met with are some portions of the State of New Jersey, the brushy plains of Long Island, Martha's Vineyard, the Elizabeth Islands, Mount Desert Island in the State of Maine, and a certain tract of barreny country in the latter State lying not far from the famed Mar's Hill, where, however, they have been confounded with the willow grouse. In the three first places mentioned, notwithstanding the preventive laws now in force, they are killed without mercy by persons such as in England are called poachers, even while the female bird is in the act of sitting on her eggs. Excepting in the above-named places, not a bird of the species is at present to be found until you reach the lower parts of Kentucky, where, as I have told you before, a few still exist. In the State of Illinois, all the vast plains of the Missouri, those bordering the Arkansas River, and on the prairies of Opellousas, the pinnated grouse is still very abundant and very easily procured.

As soon as the snows have melted away, and the first blades of grass issue from the earth, announcing the approach of spring, the grouse, which had congregated during the winter in great flocks, separate into parties of from twenty to fifty or more. Their love season commences, and a spot is pitched upon to which they daily resort until incubation is established. Inspired by love, the male birds, before the first glimpse of day lightens the horizon, fly swiftly and singly from their grassy beds, to meet, to challenge and to fight the various rivals led by the same impulse to the arena. The male is at this season attired in his full dress, and enacts his part in a manner not surpassed in pomposity by any other bird. Imagine them assembled to the number of twenty by daybreak, see them all strutting in the presence of each other, mark their consequential gestures, their looks of disdain and their angry pride as they pass each other. Their tails are spread out and inclined forward to meet the expanded feathers of their neck, which now like stiffened frills lie supported by the globular orange-colored receptacles of air from which their singular booming sounds proceed. Their wings, like those of the turkey cock, are stiffened and declined so as to rub and rustle on the ground as the bird passes rapidly along. Their bodies are depressed toward the ground, the fire of their eyes evinces the pugnacious workings of their mind, their notes fill the air around, and at the very first answer from some coy female the heated blood of the feathered warriors swells every vein, and presently the battle rages. Like game cocks they strike, and rise in the air to meet their assailants with greater advantage. Now many close in the encounter; feathers are seen whirling in the agitated air, or falling around them tinged with blood. The weaker begin to give way, and one after another seeks refuge in the neighboring bushes. The remaining few, greatly exhausted, maintain their ground, and withdraw slowly and proudly, as if each claimed the honors of victory. The vanquished and the victors then search for the females, who, believing each to have returned from the field in triumph, receive them with joy.

It not unfrequently happens that a male already mated is suddenly attacked by some disappointed rival, who unexpectedly pounces upon him after a flight of considerable length, having been attracted by the cacklings of the happy couple. The female invariably squats next to and almost under the breast of her lord, while he, always ready for action, throws himself on his daring antagonist, and chases him away never to return. Such is the moment which I have attempted to represent in the plate which you will find in the second volume of my "Illustrations."

In such places in the Western country as I have described the prairie hen is heard booming or tooting not only before break of day, but frequently at all hours from morning until sunset; but in districts where these birds have become wild in consequence of the continual interference of man they are seldom heard after sunrise; sometimes their meetings are noiseless, their battles are much less protracted or of less frequent occurrence, and their beats or scratching grounds are more concealed. Many of the young males have battles even in autumn, when the females generally join, not to fight, but to conciliate them, in the manner of the wild turkeys.

The pinnated grouse forms its nest, according to the latitude of the place, between the beginning of April and May 25. In Kentucky I have found it finished and containing a few eggs at the period first mentioned; but I think, taking the differences of seasons into consideration, the average period may be about the first of May. The nest, although carelessly formed of dry leaves and grasses, interwoven in a tolerably neat manner, is always carefully placed amidst the tall grass of some large tuft in the open ground of the prairies, or at the foot of a small bush in the barren lands. The eggs are from eight to twelve, seldom more, and are larger than those of the *Tetrao umbellus*, although nearly of the same color. The female sits upon them eighteen or nineteen days, and the moment the young have fairly disengaged themselves leads them away from the nest, when the male ceases to be seen with her. As soon as autumn is fairly in the different families associate together, and at the approach of winter I have seen packs composed of many hundred individuals.

When surprised, the young squat in the grass or weeds, so that it is almost impossible to find any of them. Once, while crossing a part of the barrens on my way homeward, my horse almost placed his foot on a covey that was in the path. I observed them and instantly leaped to the ground; but notwithstanding all my endeavors the cunning mother saved them by a single cluck. The little fellows rose on the wing for only a few yards, spread themselves all round, and kept so close and quiet that, although I spent much time in search for them, I could not discover one. I was much amused, however, by the arts the mother employed to induce me to leave the spot where they lay concealed, when perhaps I was actually treading on some of them.

This species never raises more than one brood in the season, unless the eggs have been destroyed, in which case the female immediately calls for her mate and produces a second set of eggs, generally much smaller in number than the first. About Aug. 1 the young are as large as our little American partridge, and are then most excellent eating. They do not acquire much strength of wing until the middle of October, and after that period they become daily more difficult to be approached. Their enemies are at this season very numerous, but the principal are the polecat, the raccoon, the weasel, the wildcat and various hawks.

The pinnated grouse is easily tamed and easily kept. It also breeds in confinement, and I have often felt surprised that it has not been fairly domesticated. While at Henderson I purchased sixty alive that were expressly caught for me within twelve miles of that village, and brought in a bag laid across the back of a horse. I cut the tips of their wings and turned them loose in a garden and orchard about four acres in extent. Within a week they became tame enough to allow me to approach them without their being frightened. I supplied them with abundance of corn, and they fed besides on vegetables of various kinds. This was in the month of September, and almost all of them were young birds. In the course of the winter they became so gentle as to feed from the hand of my wife, and walked about the garden like so many tame fowls, mingling occasionally with the domestic poultry. I observed that at night each individual made choice of one of the heaps in which a cabbage had grown, and that they invariably placed their breast to the wind, whatever way it happened to blow. When spring returned they strutted, "tooted" and fought as if in the wilds where they had received their birth. Many laid eggs, and a good number of young ones made their appearance, but the grouse at last proved so destructive to the young vegetables, tearing them up by the roots, that I ordered them to be killed. So brave were some of the male birds that they never flinched in the presence of a large turkey cock, and now and then they would stand against a dunghill cock for a pass or two before they would run from him.

During very severe weather I have known this species to roost at a considerable height on trees, but they generally prefer resting on the ground. I observed that for several nights in succession many of these grouse slept in a meadow not far distant from my house. This piece of ground was thickly covered with tall grass, and one dark night I thought of amusing myself by trying to catch them. I had a large seine and took with me several negroes supplied with lanterns and long poles, with the latter of which they bore the net completely off the ground. We entered the meadow in the early part of the night, although it was so dark that without a light one could hardly have seen an object a yard distant, and spreading out the leaded end of the net, carried the other end forward by means of the poles at the height of a few feet. I had marked before dark a place in which a great number of the birds had alighted, and now ordered my men to proceed toward it. As the net passed over the first grouse in the way, the alarmed bird flew directly toward the confining part of the angle, and almost at the same moment a great number of others arose, and, with much noise, followed the same direction. At a signal the poles were laid flat on the ground and we secured the prisoners, bagging some dozens. Repeating our experiment three times in succession, we met with equal success, but now we gave up the sport on account of the loud bursts of laughter from the negroes, who could no longer refrain. Leaving the net on the ground, we returned to the house laden with spoil, but next evening not a grouse was to be found in the meadow, although I am confident that several hundreds had escaped.

On the ground the pinnated grouse exhibits none of the elegance of manner observed in the ruffed grouse, but walks more like the common hen, although in a more erect attitude. If surprised it rises at once with a moderate whirring sound of the wings; but if it happens to see you at a distance, and the place is clear, it instantly runs off with considerable speed and stops at the first tuft of high grass or bunch of briar, when it squats and remains until put up. In newly plowed grounds I have seen them run with all their might, their wings partially expanded, until suddenly meeting with a large clod, they would stop, squat, and disappear in a moment. During the noontide hours several may often be seen dusting themselves near each other, either on the plowed fields or the dry sandy roads, and rearranging their feathers in a moment, in the same manner as the wild turkey. Like the common fowls, they watch each other's motions, and if one has discovered a grasshopper, and is about to chase it, all the rest within sight either fly or run to the place. When the mother of a brood is found with her young ones she instantly ruffles up her feathers, and often looks as if she would fly at you; but this she never ventures to do, although she tries every art to decoy you from the place. On large branches of trees these birds walk with great ease, but on small ones they require the aid of their wings to enable them to walk steadily. They usually, if not always, roost singly within a few feet of each other, and on such little eminences as the ground affords. I have found them invariably fronting the wind, or the quarter from which it was to blow. It is only during the early age of the young birds that they sit on the ground in a circle.

The flight of the prairie hen is strong, regular, tolerably swift, and at times protracted to the distance of several miles. The whirring of its wings is less conspicuous than that of the ruffed grouse or "pheasant" (*Tetrao umbellus*), and its flight is less rapid. It moves through the air with frequent beats, after which it sails with the wings bent downward, balancing itself for a hundred yards or more, as if to watch the movements of its pursuer, for at this time they can easily be observed to look behind them as they proceed. They never rise when disturbed without uttering four or five distinct clucks, although at other times they fly off in silence. They are easily shot down by a calm sportsman, but are very apt to deceive a young hand. In the Western country they rarely stand before the pointer, and I think the setter is a more profitable dog there. In the Eastern States, however, pointers, as I am informed, are principally employed. These birds rarely await the approach of the sportsman, but often rise when he is at such a distance as to render it necessary for him to be very prompt in firing. Unlike other species, they seldom pass over you, even when you surprise them, and if the country is wooded they frequently alight on the highest branches of our tallest trees, where they are usually more accessible. If shot almost dead they fall and turn round on the ground with great violence until life is extinct; but when less injured they run with great celerity to some secluded place, where they remain so quiet and silent as to render it difficult to find them without a good dog. Their flesh is dark and resembles that of the red grouse of Scotland or the spotted grouse of North America.

The curious notes emitted in the love season are peculiar to the male. When the receptacles of air, which in form, color and size resemble a small orange, are perfectly inflated, the bird lowers its head to the ground, opens its bill and sends forth, as it were, the air contained in these bladders in distinctly separate notes, rolling one after another from loud to low, and producing a sound like that of a large muffled drum. This done, the bird immediately erects itself, refills its receptacles by inhalation, and again proceeds with its tootings. I frequently observed in those prairie hens which I had tamed at Henderson that after producing the noise the bags lost their rotundity and assumed the appearance of a burst bladder, but that in a few seconds they were again inflated. Having caught one of the birds, I passed the point of a pin through each of its air cells, the consequence of which was that it was unable to toot any more. With another bird I performed the same operation on one only of the cells, and next morning it tooted with the sound one, although not so loudly as before, but could not inflate the one which had been punctured. The sound, in my opinion, cannot be heard at a much greater distance than a mile. All my endeavors to decoy this species by imitating its curious sounds were unsuccessful, although the ruffed grouse is easily deceived in this manner. As soon as the strutting and fighting are over the collapsed bladders are concealed by the feathers of the ruff, and during autumn and winter are much reduced in size. These birds, indeed, seldom if ever meet in groups on the scratching grounds after incubation has taken place; at all events, I have never seen them fight after that period, for, like the wild turkeys, after spending a few weeks apart to recover their strength, they gradually unite, and as soon as the young are grown up individuals of both sexes mix with the latter and continue in company till spring. The young males exhibit the bladders and elongated feathers of the neck before the first winter, and by the next spring have attained maturity, although, as in many other species, they increase in size and beauty for several years.

In the Western country at the approach of winter these birds frequent the tops of the sumac bushes to feed on their seeds, often in such numbers that I have seen them bent by their weight; and I have counted more than fifty on a single apple tree, the buds of which they entirely destroyed in a few hours. They also alight on the high forest trees on the margins of large rivers, such as the Mississippi, to eat grapes and the berries and leaves of the parasitical mistletoe. During several weeks which I spent on the banks of the Mississippi, above the mouth of the Ohio, I often observed flocks of them flying to and fro across the broad stream, alighting at once on the highest trees with as much ease as any other bird. They were then so abundant that the Indians, with whom I was in company, killed them with arrows whenever they chanced to alight on the ground or low bushes.

During the sowing season their visits to the wheat and cornfields are productive of considerable damage. They are fond of grasshoppers, and pursue these insects as chickens are wont to do, sometimes to a distance of 30 or 40yds. They drink water like the common fowl when at liberty, and, like all other species of this family, are fond of dusting themselves in the paths or among the earth of the fields.

I have often observed them carry their tail in the manner of the common hen. During the first years of my residence at Henderson, in severe winters the number of grouse of this species was greatly augmented by large flocks of them that evidently came from Indiana, Illinois, and even from the western side of the Mississippi. They retired at the approach of spring, no doubt to escape from the persecution of man.

It would not perhaps be proper that I should speak of the value put on the flesh of these birds by epicures. All that I shall say is that I never thought much of it, and would at any time prefer a piece of buffalo or bear flesh; so that I have no reason to regret my inability to purchase prairie hens for eating at $5 the pair.

The Frog-Rail Theory.

Editor Forest and Stream:

The beliefs that frogs turn into sora rail, that horsehairs become hair-snakes, that barnacles breed brant, that eels spring from clams and that a dead greaser becomes a burro, are all interesting to the anthropologist as indicating a primitive type of mind in methods of searching for knowledge. Compare the horsehair snake mythologist, for instance, with the naturalist who traces the gordius through all of its immature stages, and we have a valuable object lesson in types of mind. How easy for a frog-rail theorist to turn to any authoritative book and learn all about the rail, and yet our educators in a proud land have not succeeded in teaching the average laboring man how to teach himself in such a very simple matter. The belief that deer do not eat lilypads represents the sort of mind that does not wish to acquire knowledge. The possessor of that sort of a mind need not go very far to learn that almost any hunter looks at cut lily stems to see whether they were bitten off at one nip by deer or by two or three nips by muskrats. He may argue that the deer do not hold the lily pads down and that they step behind a tree and spit them up, but almost any deer hunter who is quick has managed to kill the deer before they could spit up a whole paunchful of lilypads and buds. The frog-rail theorist represents a man who cannot learn because his methods are incomplete. The man who deprives deer of their reputation for good taste in diet represents the type that will not have knowledge because he prefers not to have it. R. T. M.

PHILADELPHIA, Oct. 16.—*Editor Forest and Stream:* Seeing the article written about the rail bird in this week's issue, I thought I would send you a clipping cut from the Philadelphia Sunday *Times*, June 21, 1896, which may throw a little more light on this mysterious bird:

LOWER ALLOWAY, June 20.—It has always been the general belief among sportsmen that rail birds do not breed in this section of the country, but the finding of a rail bird's nest with three eggs in it proves the falsity of the belief. Howard Harris, of this place, has the nest, and as he saw the mother bird fly from it there is no doubt but they occasionally rear their young in these parts. The nest and eggs are on exhibition in this place and are quite a curiosity.

A friend of mine killed a rail bird in Christmas week, 1895, on a fairly cold day—too cold for a frog to come out of the mud, much less a bird of this species to be this far North; the bird was shot on the marsh above the Philadelphia Gun Club's grounds, on the Pennsylvania shore, Delaware River. A READER.

Migrating Bluebirds.

SHELDON, Vt., Oct. 10.—During the past week both night and day flocks of bluebirds have passed here southward from their more northern breeding places. Those observed during the day a portion of the flock was going on at a steady flight, while the others, evidently the young birds, were flying along, chasing each other in a frolicsome kind of way, as though they considered this migrating business a great lark. As these are the first bluebirds seen here this season, the spring flight northward must have passed here in the night, otherwise we would have been sure to have seen or heard some of the birds. A day or two before the last big storm we saw high in the air a flock of sea gulls going south. STANSTEAD.

Audubon Copper Plates in the Smithsonian.

WASHINGTON.—There are in the Smithsonian six of the original copper plates of Audubon's birds: the Virginian partridge, whooping crane, "hooping crane," scarlet ibis, chuck-will's-widow and the American robin.

Besides the copper plates there are a number of the prints.

The plates were presented by a Mr. Stuart, of New York, and a patron of the American Museum of Natural History. B. A. BEAN.

Cats and Coyotes.

BOSTON, Oct. 15.—*Editor Forest and Stream:* E., writing from Shirley Basin, Wyo., in your last number, wants to know what to do with the coyotes that kill his cats. I would suggest the sending them to large cities and towns to be turned loose in back yards at full moons. If they are good jumpers they might possibly end a long-suffered nuisance and sleep-disturbing cause in thickly settled communities. REIGNOLDS.

Game Bag and Gun.

Our readers are invited to send us for these columns notes of the game supply, shooting resorts, and their experience in the field.

SOME AMERICAN GAME BIRDS.*

IV.—The Snipe.

ACCORDING to the writings of ornithologists, the breeding grounds of the snipe begin from about 42°, which would be from a parallel drawn through the northern part of Nebraska, Iowa, etc., thence north to the Arctic Circle. It migrates leisurely southward as the winter season approaches, feeding on the available grounds, ultimately going as far south as the West Indies and northern South America. It is a bird of the wet lands, and, as with the woodcock, the available area entire for a food supply is small as compared with the earth's surface; such area being the places which are soft enough to be bored with its sensitive bill, and also containing food to its liking and enough of it to supply its needs. As much soft and wet land may also be gravelly, or sandy, or clayey, etc., either unfit to sustain the animal and vegetable life on which the snipe subsists, or from its refractory nature being impervious to the delicate weapon with which nature has provided the snipe for the capturing of its food, it is apparent that of all the wet land there are only certain parts which are available to the bird in securing a food supply. Of the places which afford it food, some are permanently good throughout the whole season, as, for instance, the sloughs and marshes and parts of river valleys of the prairie country wherein it makes its summer habitat; while other places are but temporarily available, as land made soft and wet by heavy rains, though such places may serve it well for many weeks, as in Louisiana and Texas in the fall and winter months, during the rainy season, which in those States is largely the equivalent of winter. It may seek its food in places which are quite wet, as in some of the large marshes—places too wet for the shooter to venture into without rubber boots if he value dry feet—and again in some other sections it may make its haunts on land so firm and dry that the hunter may walk on it pleasantly and dry shod in ordinary shoes.

While the woodcock, its long-billed brother, is a bird of the covert, the snipe is a bird of the open; and on both birds nature lays a more severe restriction on a late stay in the North than she does on any other game bird, for a snipe or woodcock attempting to gain a subsistence in a frozen country would be a pathetic sight indeed.

Its food is said to be the larvæ, tender roots of plants and worms, which it secures by boring, and such insects and other eatable food as it can secure on top of the ground.

To the local sportsman its habits in the shooting season—which is mostly the migratory season—seem erratic and unknowable, if its unstable characteristics may be called habits at all. It is in one place to-day, another to-morrow. To-day there may be an abundance, to-morrow not one. Or it may go contrary to its erratic reputation and remain a number of days about the same grounds. Still, the shooter is largely in ignorance of what the snipe will do next. The weather and food conditions may be the same so far as observation can determine them, and yet the birds may come and go in their own whimsical way regardless of conditions. Apparently some mysterious impulse seems to seize the birds of a certain locality either to come or go, though not in the manner of birds which go in flocks wherein all fly as a part of the flock. Snipe fly mostly in ones or twos or threes, sometimes more, but always in small numbers, and being thus independent in flight it is difficult to understand how the common impulse to seek other grounds is at the same time felt and acted on by all the birds of a certain neighborhood, or at least most of them, there being many exceptions as a matter of course, as for instance in a section where there are birds in abundance on a certain day they may not all leave at the same time, and indeed some scattered birds may be found on certain ground throughout the whole season. However much the exception may affect the few, the greater part of the birds are erratic and lawless most of the time.

No doubt that which seems whimsical and mysterious in the life of the snipe is really in harmony with the needs of nature. The bird being largely nocturnal in its habits, it is difficult to learn its ways, and it is specially difficult for the resident of one locality to observe its habits with any degree of precision. Seeing it in but one small corner of its habitat, the local sportsman can at best gain but a fragmentary knowledge of its needs and its habits, though he may infer that the small part which he sees is really the whole.

Being swift of wing and enduring of flight, the snipe undoubtedly feeds over vast areas in grounds many miles apart, twenty or thirty miles being of no more moment to it when in search of food than twenty or thirty rods between wheat fields would be to the prairie chicken. Moreover, when snipe invade fields in vast numbers, as is frequently the case, the ground is soon thoroughly bored, and no doubt all the food within reach near the surface is consumed, and thus it may be a necessity for the snipe to seek food elsewhere till the grounds have had time to rest and to replenish.

Many writers lay great stress on the difficulties of the shooting of snipe, treating of it as a bird of phenomenal swiftness and erratic flight, and the shooting of it as requiring something extraordinary in the matter of skill. Such savors of limited experience as to number of birds shot, the brief part of a season in which they were shot, and the limited opportunity in which to observe their habits. As a matter of fact, snipe shooting at certain times is the easiest of shooting, as on warm days, when the birds are fat and lazy, flying slowly and tamely, with pendulous bills, as is often the case in the fall in the South when they are in good feeding grounds. They are then disinclined to move, and indolently lie to the dog's points till the shooter walks them up.

The books teach that the snipe rises with a zigzag flight against the wind, darting to right and left with such rapid flashes of speed that the best of shooters are puzzled, and often miss. The snipe, it is true, rises against the wind when there is a wind, and zigzags a few times to get up speed and a straight course. Many writers on snipe shooting lay it down as correct that the shooter, to take advantage of the snipe's peculiarity in rising, should shoot down wind, or advance to the dog's point down wind, so that when the snipe is flushed it will fly toward him. All such savor of the novice, or of a skill which needs nursing; and all the difficulties are greatly exaggeratéd—zigzag, swift flight and all. No bird of the open is so difficult to shoot as is the bird of the covert. The zigzag of the snipe is in the beginning of its flight, and nothing is easier than to wait on it a moment till it straightens out on a straight flight before shooting at it; and then it is a matter of shooting on the wing, as other wing shooting is.

As to walking down wind to secure a better shot, the sportsman need not concern himself about it in the least, excepting perhaps on such days as are cold and windy, and days when the birds are very wild and rise at the extreme range of the gun. As with pigeon shooting, the really good shot does not let his birds get hard if they rise within range. He doesn't care a sou whether they zigzag or not, for he snaps them as soon as they are on the wing; or being well on the wing, he permits them to get into steady flight and then delivers his fire. There is on the part of the experienced shot no particular attempt to reach the bird from a weak quarter. He takes the shooting as it comes. Snipe shooting is open shooting, and there is nothing whatever about the bird or its flight which makes it a phantom.

On windy days, or when it is cold weather, it may be very wild and rise at extreme ranges, and shooting then is quite as much a test of the gun as it is a test of the shooter's skill; though few writers pay any heed to the distinction, and consider it all, far or near, as a matter of skill alone. At best, walking down wind on snipe is an uncertain advantage, for be it known that a snipe can fly down or across wind with a swiftness and ease which disposes very quickly of any trifling advantage of a few yards taken up wind for a start.

The habits of snipe as oftenest described are their habits when they are lean and wild, or wild from a change from warm to cold, or from still to windy weather. But to teach that such is their regular manner of flight would be on a par with teaching that quail live in the tree tops because they sometimes take refuge therein.

Even when lean and wild, on a calm day the snipe does not strain the skill of a good shot, but on a windy day the wild, lean snipe can dart very swiftly across or down wind, and if to this be added rises at long range the shooting is then really difficult, though then, as mentioned before, it is also a test of the gun. When thus wild, the snipe is exceedingly restless and moves about a great deal. It then takes alarm quickly, flies with its bill extended straight ahead, flying so high as mostly to be out of range. It can pitch to the ground from its highest flight, darting to the ground with stiffened wings and lighting with the greatest ease.

In the course of migration the birds stop in favorite places where food is abundant, and sometimes remain till the weather becomes too unpleasant to remain longer. As a rule they arrive in the South in a lean condition, and in such condition the snipe is at its best as a flyer.

Shooting experience limited to times when the snipe are wild is an experience with the snipe in its most difficult moods. But, as mentioned before, such parts of snipe shooting are not all of snipe shooting. When the birds are lean they are also wilder, regardless of weather conditions.

Snipe shooting as to quantity varies one locality with another more than does any other kind of shooting, for one locality may contain but a few birds to reward the shooter's efforts, while in other localities they may fairly swarm, as in parts of Louisiana and Texas in the fall and spring months, when the birds are migrating, where they generally remain several weeks enjoying the food abundance and becoming very fat, and some scattered ones may be found all through the winter. The heavy rains of fall and spring, frequently a downpour of days, soften the fat alluvial prairie lands so that hundreds of square miles are fitted for the snipe's habitat. In particularly favorable sections of the prairie, cotton, corn and sugar fields, they may at times be found in thousands. A dog in such shooting is in the way except to act as a retriever. There is no woodcraft necessary in such shooting. The shooter walks along till the birds fly up, and so rapidly will he sometimes flush them that at every step or two it is fire and load and fire and load again. At such times the gun becomes too hot to hold in the hands, and the shooter must perforce stop till it cools sufficiently to handle.

Enormous bags have been made on snipe, particularly in Louisiana and Texas, where the greater part of the snipe of North America congregate for a few weeks in their period of migration. One of the greatest, and I believe that it is referred to now as the greatest, was made many years ago by Mr. Pringle, a wealthy sugar planter of Louisiana, who had great fame as a sportsman of rare skill, and who bagged 400 and some odd snipe in a day. This is a large bag indeed, but it is but one of thousands of others large in themselves, but so common as to excite no special comment in that section.

I have told of these matters to gentlemen in the North, whose success was measured by a dozen birds, more or less, as the result of a day's shooting, and such being outside of their personal experience they have been pleased to consider it an idle tale, assuming a ludicrous astuteness in respect to what should be true the world over from their narrow experience in shooting a few birds over a few acres of ground each year.

In regard to the big bag made by Mr. Pringle, it may be added by way of explanation that he had negroes to assist him, some to carry his spare guns, others again to carry the ammunition and retrieve the dead birds. I have been told by men who have hunted with him that he is a most indefatigable walker and possesses extraordinary quickness and accuracy in the use of the shotgun, snapping the birds almost on the instant that they take wing. In that land of abundance at that day it was not considered unsportsmanlike to kill all that the sportsman was pleased to kill, for after all were done shooting there was no apparent diminution in the abundance of the birds. If they killed many, their neighbors derived the benefit of it; and the killing was at irregular intervals, differing from the steady drain made on the bird supply day after day by those who shoot for market. This circumstance of the record bag was a happening of many years ago, when the sentiment concerning game preservation was different everywhere North and South from what it is to-day.

As to snipe shooting and the way of it, the proper manner to shoot them is to go forth and shoot them—in other words, the set manner of doing this thing and that thing as taught by some writers is all very well if they can do no better. There is no rule whereby snipe shooting can be made soft and easy, and there is no sportsman with proper ambition who will care to have his skill less than the best test that the bird can offer. If it is unequal to the test, practice will improve it; and if it will not, there is at least the pleasure of trying to cope with the bird. The proper skill is that which takes the shooting as it comes instead of picking out the easy shots or easy combinations to secure them.

The difficulties of snipe shooting in general have been greatly exaggerated. The lightning zigzag up wind at the start and the swiftness at all times as set forth in print would lead the novice to believe that it was almost beyond the skill of any one without a special "gift" to

* Other papers of this series were: The Woodcock, Sept. 12; Ruffed Grouse, Oct. 10; Quail, Oct. 17.

kill snipe. The books prescribe that the shooter should walk down wind, so that when the snipe rises it will come toward the shooter, and the zigzag is dwelt upon as a thing to make much of. As a matter of fact, the true snipe shooter walks in any direction which seems favorable to find snipe, regardless of the wind, and he shoots with no more heed of the zigzag than that it is but a momentary flurry of the bird in starting its flight, and if it zigs too long he just snaps it in its zigging. On the raw, windy days, particularly when the snipe are lean and wild, and flush at long ranges, it is then hard shooting, and success is, as it may happen, regardless of rule or no rule, though a small matter of skill is much more successful than is a large matter of rule.

The best gun for snipe shooting one day with another is one that is moderately choked or one which is a true cylinder bore, though, as it is all open shooting, and therefore not so difficult as shooting in the covert, good work may be done with a full choke, since the shooter can pick his distance to shoot his birds. However, it is not every man who can wait on his bird or estimate distances at a glance, so that it is better to have a gun which will be available for instant use when the bird rises if one can have it. A 12-bore is most commonly used, and as for the size of shot, No. 8s or 9s or 10s are good, the latter being quite large enough when the birds are fat and lazy. As snipe shooting is open shooting, the length of the barrels is of no importance in the manner in which it is important in shooting in covert.

As a bird to shoot over dogs the snipe is inferior; decidedly so. Sometimes it is in such abundance that a dog is unnecessary. At other times it is so wild that it will not lie to the dog at all; or being fat and tame, it may lie too well. Again it will be in marshes so wet, cold and rank with marsh grasses that it is impossible for a dog to do satisfactory work, however good his intention may be and however good his ability. Very few dogs have a natural fondness for work on snipe. It is acquired in most instances, and some dogs, good on upland game birds, so thoroughly detest the snipe that they will refuse to recognize it. On the other hand, some dogs like the snipe very much as a bird to work on, though such are the exception.

Considered strictly as a bird of the open, the snipe affords the best of all open shooting, since there is something to test the sportsman's skill in it at times, though there is never the weird uncertainty about it that some writers have discovered in its shooting; no doubt an easy and safe explanation of the difficult shooting being found in the manner in which the shooter handles his gun rather that in the manner of the bird's flight.

When the birds are in such great abundance and can be bagged with little effort by walking them up and shooting them, the sportsman soon tires of it. It is too easy and certain to be a sport. On the other hand, when they are scarce and wild, and the weather is windy and the birds will not lie to a dog, it is too difficult and uncertain. The dog is eliminated then as a factor, and the shooting is largely a matter of taking chances. When the happy medium is found, the birds not too plentiful, neither too wild nor too tame, lying fairly well to the dog, it is excellent sport indeed, though in Louisiana I noted it as a remarkable fact that where there were an abundance of both snipe and quail, the sportsmen tired soon of snipe shooting and gave the quail the preference. Yet all sections are not so fortunate, for all the game birds combined afford but a moderate opportunity for sport in some sections.

B. Waters.

Game in Central New York.

Ithaca, N. Y.—Prime ruffed grouse shooting may be had in this part of central New York at the following points: Peruville, West Groton, East Homer, Freeville, Harford Mills, Danby, Enfield, Hector, and along the east side of Cayuga Lake between Lake Ridge and say Union Springs.

The sky is now of the deepest blue, the landscape in its loveliest attire, the atmosphere is softly tempered with influences which make men healthy and happy, and every condition is perfect for the enjoyment of ideal sportsmanship. And the grouse, ah me! how like a thunderbolt in gray do they flash across one's vision. Unfortunate indeed is the man who never goes afield in quest of the intrepid grouse.

The black and gray squirrel, hare and rabbit season, which opened to-day, the 15th, bids fair to nicely reward the sportsman who fancies this kind of shooting. Rabbits abound all around this city in covers easy to reach, and eight or ten miles out in almost any direction will disclose them in plenty. Near White Church, and in cover not far south of Caroline Depot on the D., L. & W. R. R., a good number of hares—big, white, bounding fellows—may be found. Gray squirrels have been unusually plentiful, but it is charged that a good deal of illegal shooting has been persisted in on this game, with the result that in some sections, notably near Genoa, eighteen or twenty miles north of here, the supply has been tremendously reduced. I have this on the authority of a well-known resident of that town. Other localities furnish reports of illegal shooting on both squirrels and rabbits. Gray squirrels should be found near Caroline, Speedsville, Etna, South and West Danby, in the vicinity of Mecklinburg, along through the western part of the town of Lansing and extending well into Cayuga county, parallel with the lake. Woodcock shooting has not been up to the average.

M. Chill.

The Forest and Stream is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

SHOOTING PRAIRIE CHICKENS.

From boyhood I have been a great sportsman, and have enjoyed many a pleasant trip through the West with rod and gun. Many a day I have tramped across the great stubble fields behind my well-trained dogs in search of a covey of chickens, or a stray one to knock down in front of my gun. I have also wandered through the wild forest laying in the northern part of Minnesota, where the historical Lake Itasca lies sleeping in its beauty, filled with fish of the choicest kind and swarming with wildfowl of all descriptions, and whose shores are alive with otter, muskrat and mink.

On Sept. 14, 1895, in company with my brother Bob, fully equipped with our hunting traps and two finely broken dogs, we left our city of St. Paul at 8:30 in the evening on the Great Northern train, and after a journey of eleven hours reached our station, Ada, Minn., a stop well known to the sportsmen of that State, as the country surrounding this town is said to be the best chicken fields now known on the continent.

We were there provided with a team and wagon to haul us to our camping grounds, and soon had our outfit, consisting of a boat, tent, and a fair supply of provisions and other things necessary to the hunter, piled on the wagon, and in a few minutes later we were making our way along the road. An hour and a half of steady traveling along the muddy road brought us to the Marsh River, where we camped.

After breakfast Bob suggested to paddle down the river and take a look at our neighborhood before tramping the fields for birds. I sat in the bow with the paddle, steering the boat as it cut down the current, while Bob was placed in the stern with his trolling line. The boat went drifting along with the current, winding in and out between the narrow channels as smoothly as an arrow.

Now and then from in front of us would jump from beneath the tall rushes that were thickly set around the shore a flock of jacksnipe and go darting away, sending out their little call, *swack-swack*, as they quickened their flight. Now and again in front of us would rise from the water a duck or two and go quacking away, frightened by the sight of the boat. Hundreds of large gray hawks went sailing over our heads, with their cruel, sparkling eyes fixed upon the water, and their curved bill pointing downward, searching for a wounded duck or a dead fish to make their prey.

The everlasting cawing from the crows rang through the woods, and the humming of the partridge mingled with many other sounds that come upon the ear from the forests.

After drifting down the river about six miles we turned and started back against the current, and after a long struggle landed our little boat in front of where our tent loomed up among the trees; it was about noon, and we had a handsome string of fish. Bob and I soon had a hot fire of dry pine, and in a few minutes there was ready a delicious meal of the fresh fish we had just drawn from the stream.

After stretching out on the grass and finishing our smoke, we loosened the two setters and started through the woods for the stubble fields, making our way stumbling over fallen trees and winding in and out through the thick underbrush until we finally reached the edge of a big wheat field, where we set the dogs working, much to their delight. Old Cap, a big, staunch English setter, was soon on his old natural run, backed up by my fine little Lewellyn bitch Quail, searching for the scent that seems so pleasing to a good dog; they soon separated and began covering more ground, with their noses trailing and their tails waving like the wind to see who could strike the first stand.

Bob and I spread apart, and tramped along with our guns ready to bring to the shoulder at the sight of the first bird. After walking about a mile over the prairie, we came to a road which led along through the field; this we followed up while the dogs covered the stubble beside us.

Just as Quail was moving off of the wheat on to a strip of flax she suddenly stopped with the scent of game, and old Cap, who was ranging a short distance off, caught sight of the crouching dog and came like a streak of lightning toward her till he finally slackened his pace, lifted his left front leg from the ground, and stretching his long nose forward proudly backed up the little bitch.

Bob and I were soon behind the dogs ready to try the first bird. I spoke to Quail to go forward and she rose from her crouching position and worked nervously on about 4yds. and started a big bird that rose wild and flew straight away, giving us both a good shot. Crack! went my gun, knocking out a few tail feathers, but failing to bring her down. Then Bob's gun spoke twice and with the second shot sent her spinning to the ground.

The dogs then moved up again and finally flushed three more that jumped up wild and started in different directions, one coming my way and two going Bob's. I sighted mine as it screwed its tail sideways and sent the left load after her, which failed to score, but as the right barrel was discharged she let go and cut her way head over heels to the ground. I quickly whirled around and saw Bob drop one bird, but miss the other clean. We then marked her down about 200yds. off, and after failing to start more and finding our three dead birds after considerable skirmishing around in the stubble, Bob called Cap with him and I took Quail, and we started with both dogs searching far and near for the scent of the stray chicken which we had marked down.

We were watching the setters work some little distance off until they finally drew near the spot set for the bird. Suddenly the little bitch whirled around, pricked up her ears, and straightening out her wavy tail placed the bird in a small bunch of willow bushes growing on the side of a little stream that went rippling through a deep ditch.

We backed up the dogs, and soon the bird started from under Quail's nose, giving an elegant shot; I sighted it, but to no use, as it fell to Bob's shot before I could pull my trigger.

After we found the bird we started down the little stream to find out where it went to and see if we could bag a duck or two on our way.

The dogs were hunting nicely on the field, hunting gayly to strike another covey of chickens, while we continued our tramp along the bank of the stream. We had gone scarcely a half mile when the little river began to widen and flow more freely. This brightened up our thoughts and encouraged us on our way, and after three or four miles of hard trudging we came to a marshy piece of ground filled with tall rushes. Thinking a lake or pond must be near, we pushed eagerly on, with the dogs close at our heels, for about eight rods, and gazing out through the tall, thick reeds we beheld a fine little pond, covering about an acre of ground and an ideal place for ducks. Nor was it long thereafter that the dogs had occasion to retrieve four large fat mallards, increasing our string to eight birds.

As we were about to turn to leave we heard the call *quack-quack*, and looking around saw two pintails headed for the pond. "Mark!" said Bob, as he drew back the hammers of his gun. In less than a second the ducks were overhead and the guns cracked four times, but only bringing one to the ground.

We now started through the reeds to gain the prairie and move back toward camp, as we only had an hour's shooting before sundown, and were over six miles from our starting point. We put the dogs working on the field and started back over the same ground we had came. The sun was just setting in the western sky, throwing out its crimson light, which met the top of the stubble, giving a beautiful look to the great field which stretched away for miles.

We tramped ahead earnestly for the big woods where our tent was placed, hoping to gain the edge before the dark night set in.

The dogs ranged freely on in front searching for birds, our eyes following them closely all the time, hoping to see them make one more stand while it was still light enough to shoot.

They ranged steadily for nearly an hour, not getting a whiff of a bird; but as old Cap was just advancing on a bunch of bushes he suddenly dropped like a shot, while the little bitch backed him closely up.

We advanced, Bob on one side and I on the other; two birds started from under the dogs and sailed away at an exceedingly rapid gait for a pair of chickens. Bob's gun rang out twice and killed them both, but by as fine a shot as I ever had the pleasure of seeing a sportsman make. Then four flushed wild and spread apart. I sighted one, fired, and had the satisfaction of seeing her fall to the last shot. Bob killed one of his, and we marked the others down a good way off.

As the sun was now sinking rapidly behind the hills, we decided not to follow them, as we might happen to lose our way by the extra turns across the fields, and had three long miles before us to reach our tent.

We soon found our birds, and struck up a rapid walk for camp. After tramping along the prairie a short distance the sun slowly disappeared, and we were left to make the remainder of our journey by the misty darkness which comes between sundown and moonlight.

After a long walk through the cool evening air our path was lighted by the moon as it stole from beneath the clouds and rode calmly across the sky.

A long walk across the fields brought us to the edge of the woods, and we started through them for the tent.

The moon's reflection spread down beneath the trees and guided us as we picked our way through the tall, thick brush.

After succeeding in getting many a hard fall over stumps and other things in our path, we reached the tent thoroughly bruised, but with eight chickens and five ducks—not a large string by any means, but enough to satisfy a sportsman's gun for an afternoon hunt.

P. C. Heard.

TWO WEEKS AT BIG MOOSE LAKE.

At promptly 6 A. M., Sept. 4, the train pulled out from the New York Central station with our party on board, consisting of Dr. and Mrs. W. J. Leake, Mr. and Mrs. B. V. Covert, with guns, ammunition, fishing tackle and my pointer Sank.

We had planned for weeks previous for a trip to the Adirondacks, and a look of delightful anticipation shone on each face as in fancy we seemed to see Club Camp on Big Moose Lake, our destination, welcoming us. At 4:15 we reached the station, and after loading our belongings on the buckboard that was in waiting we started on foot to the lake, a distance of about two miles. As this was the first experience any of our party had ever had in the woods everything was enjoyable. Now and then a chipmunk or a squirrel would dart across our path, and in the distance the song of some wild bird would break the stillness.

As we reached the little lake the sight that met our eyes was beyond description. There was not a ripple to disturb the surface of the water, and the huge mountains surrounding it all lighted by the sun as it was disappearing over the western hills, there came to each one a feeling of awe and admiration.

We were quickly taken to our camp by our guide, who had met us at the landing, and there settled ourselves for the two weeks of solid comfort.

The following morning at about 9 o'clock the Doctor and the guide started out for a little tramp, saying they would be back at noon, while I took the dog with me for a go at the partridges, etc., which we had been informed could be found in plenty here, but I was disappointed, and I may here add that we never saw a game bird while there except some ducks in the distance. You may imagine our surprise when at about 1 o'clock we beheld our Doctor coming into camp with a nice big deer on his back. It had been feeding about half a mile back of our camp when he shot it with his rifle. The writer then decided that if deer were so plentiful he would not go out to get his deer until a day or so before breaking camp, as we wished to take one home with us, so for the next few days we contented ourselves with sight-seeing and shooting red squirrels (the only game we could find), for even the fish refused to bite the tempting bait we offered them.

By this time we heard of many who were out jacking night after night and were not very successful, so I decided I had better take a deer any time I could get one; and nearly every night after this found us floating for deer. Although we frequently heard them, we were not destined to see one. We spent two days on Sister Lakes, a distance of seven miles from camp, hoping to find there some less wise, but were disappointed again. On Monday night previous to our departure we started for West Pond "to do or die," as the floating season only lasted another night. On a previous trip to this little lake we had heard

several feeding at the shore. The deer must have known that some one of their number must be sacrificed that night, for we had been out on the lake only about twenty minutes when by the shore we saw our game, and one shot from my gun won me my first deer. Upon investigation we found a small doe, and concluded that the smallest one of the herd had been given simply to appease my wrath. We returned to camp at once and informed the sleepy occupants that now honors were to be divided.

The remainder of our stay was spent in looking for a buck; but we as well as about fifty other sportsmen were disappointed, though one was seen near the station in daylight.

We broke camp on the 17th and reluctantly started for home, well satisfied that Big Moose Lake is an ideal place for entire rest and comfort. As for game, one could not ask for better luck at shooting deer, as there were only five deer shot by people on or near our lake, and we had the honor of capturing two of them. We all returned feeling thoroughly rested, and found our good clothes (which we had left at home) entirely too small for us.

B. V. COVERT.

LOCKPORT, N. Y.

QUAIL NETTING IN INDIAN TERRITORY.

LOCO, I. T., Oct. 12.—*Editor Forest and Stream:* I have lived three years in the Indian Territory, and my chief motive for moving in here was the abundance of game. Since I have been here I have enjoyed the finest shooting I have ever had. I have never yet gone out for game and returned without, and although I might have made good wages by shooting for market, I have never yet sold a head of game of any kind. True, the price of what I might have sold at various times would have been more than acceptable had not pot-hunting always appeared to me too heinous for serious contemplation.

Now, however, there seems to be quite a different sentiment from what I have always entertained existing, not only in my mind, but also in those of most of my shooting brothers hereabouts. Market shooting and netting seems to be the order of the day—very largely the latter. I know of nets that have been running steadily for six weeks. I also know of many more who contemplate netting a little later in the season. As every one acquainted with the Indian Territory knows, quail are our chief game. The country from end to end is a veritable breeding ground for quail. They abound by millions, and always have, but they cannot endure this strain. The netter is a personage entirely void of the element of sportsmanship. He cares nothing for the devastation he is working, but day by day follows the creeks and ravines, sweeping up covey after covey, never dreaming of liberating a pair, as used to be the custom when an entire flock was captured.

On the other hand, the shooter only kills about one-half of a flock before they become so badly scattered that he begins to look for another flock. Then, too, netters tell me that when a covey is once properly "shot up" it is next to impossible to net them.

Now, while I scorn market shooting, it seems to me that what we need is more shooters, of the two evils choosing the least.

I have always understood that it was a violation of federal law to ship game, but I consulted an attorney a few days since, and his counsel was that there was no statutes existing to prevent either hunters or commission merchants from shipping game after Oct. 1.

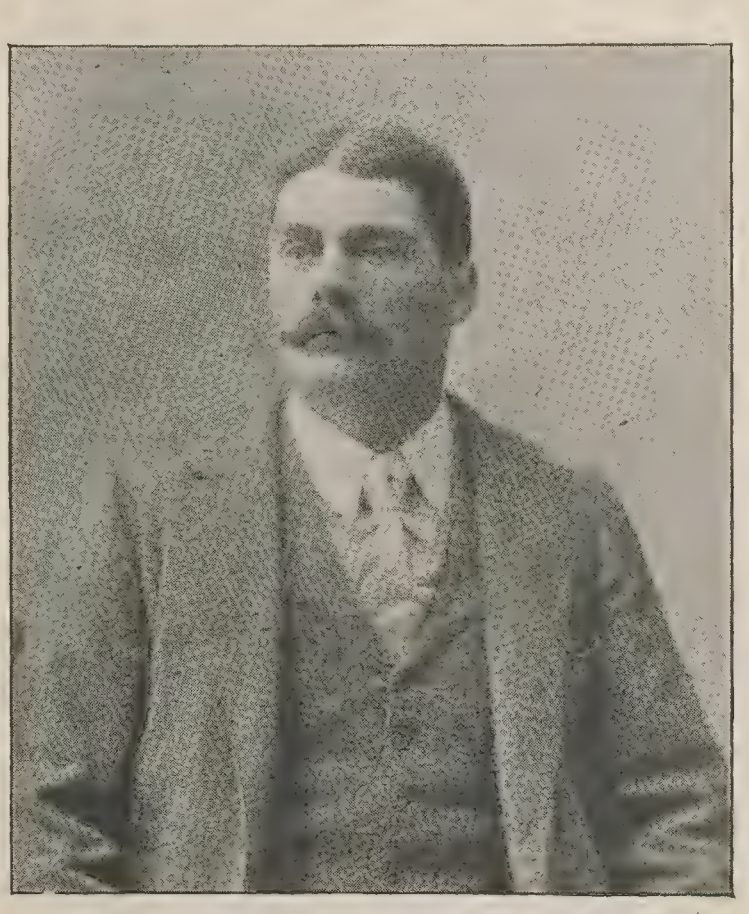
Will you please enlighten me through your most excellent journal if this is the truly the case? L. D. W.

[The only law given in the *Game Laws in Brief* relative to Indian Territory game is this: Revised Statutes of the United States, 1878.—Sec. 2137. Every person, other than an Indian, who, within the limits of any tribe with whom the United States has existing treaties, hunts or traps, or takes and destroys any peltries or game, except for subsistence in the Indian country, shall forfeit all the traps, guns and ammunition in his possession used or procured to be used for that purpose, and all peltries so taken; and shall be liable in addition to a penalty of $500.]

CHICAGO AND THE WEST.

Extension of the Yellowstone Park.

CHICAGO, Ill., Sept. 11.—Mr. John F. Cowan, a prominent sportsman and business man of Montana, long identified with the fortunes of the giant city of Butte, Mont., is a man whose words are entitled to respect. Mr. Cowan is thoroughly conversant with every detail of the environments of the Yellowstone National Park, and has for a long time been well advised in regard to the execrable destruction of the Park big game, which has been so often described in the columns of FOREST AND STREAM. It is his belief that the natural surroundings of the Park and the adjacent big game country are such that the game of that great region can best be protected by an enlargement of the boundaries of the Park, so that the lattershall include also the great hunting grounds of the Henry's Lake and Jackson's Hole country. Such a movement is not at first sight to be called impractical, and Mr. Cowan is a man of actions rather than of words himself. An act such as he advocates in his appended letter, which is given in full, would at once create a vigorous opposition upon its first promotion. It would shut out many hunting parties from a favorite ground, and excite the wrath of many local game exterminators. It would, in short, consolidate the harpy element which has always longed to break down the barriers of the Park even as they now stand. But the movement itself is not impossible of success. What its success would mean can be best understood by sportsmen whose experience, in common with that of members of the FOREST AND STREAM, has taught the wealth of the country mentioned and the reckless squandering of that wealth which has been steadily going on. It is a singular fact that Yellowstone Park has had its most earnest champions in the East. Now comes intelligent and thoughtful representation of the actual state of affairs from a man who lives almost at the gate of the Park, who is thoroughly well posted on the condition of the game supply in the Park and the adjoining sections, and who, himself a conservative and careful business man, is of the belief that the Park should not only be guarded, but enlarged. He asks the aid of FOREST AND STREAM thereto. Should it come to pass that Mr. Cowan and his friends, aided as might be by FOREST AND STREAM, should really be able to bring about this enlargement of the National Park, adding to it the great game grounds of which he makes mention, it would be an achievement so considerable as to give cause to every one concerned therewith to look back upon it with a satisfaction not to be measured with that consequent upon ordinary successes in affairs. It would seem to be something to be proud of for a decade, for a generation, and something whose benefits would accrue compoundly to coming generations perhaps more provident than this. Mr. Cowan's letter follows:



"OFFICE OF PHŒNIX ELECTRIC COMPANY, Room 1, Owsley Building, Butte, Mont., Aug. 29.—Having just returned from a tour of the Yellowstone National Park, I thought I would write you regarding a few things which suggested themselves to me while up there. You have been through the Park and are as well posted as any one as to its advantages as a game country. The sections southwest of the Park are really better game countries than the Park itself, as there is where most of the game winters. You will remember that I told you last June when I was in Chicago that I thought the herd of buffalo in the Park was practically wiped out. While up there I made inquiry of the soldiers as to the size of the herd, and they say there are only twelve of them left. This war of extermination has been waged by a band of game pirates who live along the boundary of the Park. I believe if the matter is taken hold of in earnest that Congress could be induced to take into the boundaries of the Park both the Henry's Lake and Jackson's Hole countries. This would afford the game a winter range, and would put a stop to the catching of elk in the deep snows of winter. There would be no great expense, too, in taking in both of those sections, as there are not more than five or six ranches located on Henry's Lake, and they are of no great value. The owners live off of the Park tourists and what game they can kill. Jackson's Hole, I am informed, is in about the same condition. They naturally belong to the Park, and the sooner they are put under Government control the better for our large game.

"The good which would be done toward permanently preserving our large game by such an extension of the boundaries of the Park can hardly be estimated. I have traveled through the mountains north and west of the Park, and the hunters universally through that section go near the boundaries of the Park when they want to kill game. We have all seen the game disappear so rapidly that no argument is necessary to convince any one of the necessity of game protection. By this move I think that the cause of protection would be benefited more than by anything we could do. It would add a vast area to the Park and give the game a chance to live through the hard winters. It would do away with the practice of chasing elk down in the deep snows, as all of that section where they are caught would then be under Government control.

"If FOREST AND STREAM would take this cause up and get the real sportsmen throughout the country interested in it, we could succeed in getting Congress to pass such a bill as we want. I can count on the assistance of our own representatives in Congress, and will take the matter up with those from Idaho, Utah and Wyoming, if you favor such a move. JNO. F. COWAN."

Live Western Wardens.

FOREST AND STREAM prints this week the portrait of Mr. George E. Bowers, State Game Warden of North Dakota, a man eminently qualified to be added to the list of live Western wardens who have been given mention in these

STATE GAME WARDEN GEO. E. BOWERS, NORTH DAKOTA.

columns. Mr. Bowers resides at Fargo, N. D., where he has long been known as an enthusiastic sportsman of the highest type, and devoted to the protective side of sportsmanship. He is a Western man in every sense of the word. He was born in Michigan and at an early age moved to Iowa, where he lived in the years when game was abundant. When he left Iowa, in the year of 1880, to move to his present home, the game was very scarce where once it had been so plentiful, and this decrease gave Mr. Bowers reason for thought. He writes that when he came to Fargo there was very much more game in that region than there is to-day, and he says that he can plainly see it decreasing year by year there, as it did in Iowa and Michigan. Mr. Bowers only received his appointment as warden this spring, but is already entering ardently into the duties of his office. He will not have so much to do until toward the middle of summer, when the violators of the grouse law begin their work. The writer has had the pleasure of shooting in the field with Mr. Bowers and is sure of his earnest desire and his personal ability and fitness to stop illegal and destructive shooting and fishing in his State. With proper enforcement of the game laws of Dakota, that great storehouse of game would offer sport to residents and visitors for years to come, and to this end FOREST AND STREAM will surely wish Mr. Bowers all success in his work.

Early Snow in Chicago.

CHICAGO, Ill., Oct. 17.—Without any warning or premonitory symptoms, snow began falling in Chicago this morning and has continued to fall throughout the greater part of the day. It is clammy and moist, and where it came from no one can tell, as it was not due here for nearly thirty days. This may be taken as ending the snipe season and beginning the duck season. There should be a good flight of birds to-day and to-morrow, and one would expect to hear of good bags on those marshes which still offer occasional shooting. So far we have had no wildfowl shooting of any consequence anywhere in this vicinity this fall. Should the storm of to-day have driven the birds down from the North, and should there be a clear and warmer spell following this cold freak here, as is very likely to be the case, the result may be that the birds will hang about this latitude for a time and offer a little shooting—a state of affairs much to be wished, for times have been very dull among the duck shooters hereabouts for some time.

Confusion of Wisconsin Deer Law.

There is a kettle of fish up in Wisconsin just now over the deer shooting law, it being claimed that the recent decision of the Wisconsin Supreme Court has invalidated the game laws of 1895, and left standing only such laws as were valid before 1895. This means that the statutes of 1893 govern in Wisconsin, unless the efforts of the supporters of the Buckstaff law for a rehearing be successful, in which case the law of 1895 might possibly be again made valid. Game Warden J. F. Ellarson takes the ground that the law of 1893 is now in force, and under that law the deer hunting dates were Oct. 1 to Oct. 30, instead of Nov. 1 to Nov. 21. The decision, coming as it does this week after half the month of October has passed, has been an involuntary protective agency, for half the open season was gone before anyone knew it was so shortened. Yesterday's dispatches told of great commotion among the Wisconsin deer shooters, and it is said that over fifty deer hunters went out from the city of Ashland alone for the fall hunt. There will be a swarm in the woods this coming week, and upper Wisconsin will be a good place to stay away from till the smoke of battle clears away a bit.

The attorney-general of Wisconsin yesterday wired the representative of the Buckstaff law, Col. Harshaw, of Oshkosh, that the court had granted a rehearing. It is difficult to tell how soon this may be gotten through with, and meantime the public must be uncertain just what the limitations are on Wisconsin deer this fall. Of course it is not safe to shoot after Oct. 30, for if the old law does hold it is as valid as any. If it does not hold the public may know of it just about the time when it is too late to make any difference. There is no real cause for regret over this action of the court, for the shorter a deer season is the better it is in these days. Whichever way the law may go, it is quite sure there will be plenty of deer killed.

About Town.

Mr. C. E. Willard, of the Colts Co., of Hartford, Conn., is in the city this week on his Western trip for the firm. He says business is fair. Mr. Willard is in better health than for years.

Mr. O. von Lengerke, of this city, was out last Saturday and bagged twenty-three snipe and two woodcock at the favorite grounds at Koutts, Ind., after riding over a great deal of country.

Mr. O. H. Hampton, of Indiana, well known in the FOREST AND STREAM columns, has gone home to his old shooting grounds for a time and expects to be busy having a good time.

Mr. W. L. Wells, of Chicago, mentioned as having gone to Momence, Ill., on the Kankakee River, for a snipe hunt, reports that he himself and party bagged ninety-seven birds, of which sixty-eight were jacksnipe. Mr. Wells, who is an artist by profession, is very fond of marsh shooting, and in depicting shooting scenes among the wildfowl has no superior in the country. He paints whereof he knows.

From Dakota.

Advices just at hand from the Devil's Lake country of North Dakota state that the geese are in by thousands. The Southern migration begins early this fall. Ducks are already far to the south of here and even in Texas. The flight seems much scattered this fall. E. HOUGH.

1206 BOYCE BUILDING, Chicago.

Maryland Quail and Ducks.

STOCKTON, Worcester County, Md., Oct. 10.—We were all pleased here with our last fall's quail shooting, which was the finest in years. This year it is even better. I know already of many more coveys on the same ground in the early morning. It is almost one continuous whistle from any direction you may choose to turn. I have asked friends from all over the county how the bird supply is with you? The reply is always, "Plenty, plenty; come over and bring your friends." All the coveys I have flushed are large ones, with big strong birds that make a good flight. I had several here shooting last fall who had been to North Carolina. They pronounced our birds larger and stronger on the wing. There is no doubt we are to have a great quail season.

Last year we had very little grass on the flats, but this year it is up to the top of the water at low tide, so heavy that it keeps these big stretches of water almost as flat as mill ponds. We look for large flights of geese, brant, redheads and bluebills, and if feed is any indication of their movements, expect to have good shooting all winter. There are numbers of black ducks now in the ponds on the marshes and some few shell ducks flying out in the bay. Some few bay birds still here. My son and a friend killed over 100 on the marsh one morning last week, all yellowshanks and graybacks. O. D. FOULKS.

Game Laws in Brief.

THE *Game Laws in Brief*, current edition, sold everywhere, has new game and fish laws for more than thirty of the States. It covers the entire country, is carefully prepared, and gives all that shooters and anglers require. See advertisement.

THE LONG ISLAND DUCKING LAW.

A NOTE in these columns the other day stated that "the New York law permits duck shooting from boats propelled by hand and from sail boats in Long Island Sound, Gardiner and Peconic bays; but it does not permit shooting from naphtha nor steam launches, which is reported to be practiced extensively."

The statement of the law as to naphtha and steam launches was only partially correct; that is to say, while the text of the statute does specifically permit the use of row or sail boats, and does not by direct declaration permit naphtha and steam launches, it does in effect permit the employment of these latter by .omitting any prohibition against them. We have been led to look into this law by a letter from Mr. Francis Hoag, Jr., editor of the *Suffolk County News*, who wrote:

Editor Forest and Stream: Please accept my thanks for your very valuable little book, *Game Laws in Brief*, received a day or two ago. I intend to quote from it this week the special laws relating to Long Island, but in preparing the copy I am surprised to find that, although it does not expressly say so, it implies that the shooting of wild ducks from sail boats is prohibited. I am the more surprised because this is the common way of hunting ducks down here, and I can hardly think that all our sportsmen are intentional violators of the law. Why should gunners be allowed to kill ducks from sail boats in Long Island Sound, Gardiner's and Peconic bays and not in the Great South Bay? I cannot understand. I am not at all anxious to criticise your book, nor is it my object to claim a reward for finding a possible error, but I am anxious to publish the law exactly as it is, and if it has been recently amended in this particular I think the people should know it. If you could set me right you would be conferring a great favor.

FRANCIS HOAG, JR.

As Mr. Hoag has already been advised, the *Game Laws in Brief* states the law correctly and as it appears in the original. The trouble is not with the *Brief*, but with the law itself. As to the apparent application of the law to some waters and not to others, that was probably the intention of the Legislature; the framers of the statute undoubtedly meant to forbid the use of sail boats except in Long Island Sound, and Gardiner and Peconic bays. But as a matter of fact there is no prohibition of the use of craft of any character whatever or of floating devices of any kind in Long Island waters. Here is the law, all of it that bears on this point: Sec. 71, of general application to all other parts of the State, reads, italics ours:

Web-footed wild fowl shall not be pursued, shot at, hunted, killed or caught in any way, save with gun raised at arm's length and fired from the shoulder without other rest; nor from any boat other than a boat propelled by hand or floating device; nor by the use of any boughhouse at a greater distance than 50ft. from either the shore or a natural growth of grass or flags. Such fowls caught or killed in any manner prohibited by this section shall not be brought to the shore, sold or possessed. *The provisions of this section shall not apply to Long Island and Long Island Sound.*

But this by its express statement has no application to Long Island Sound and Long Island waters. The section relating to these is Sec. 162, the text of which runs:

Floating devices may be used for the purpose of shooting web-footed wild fowl therefrom in Long Island Sound, Great South Bay, west of Smith's Point, Shinnecock and Peconic bays, and in any part of said counties said birds may be pursued and killed from boats propelled by hand, and from any sail boats in Long Island Sound, Gardiner and Peconic bays.

While this section says that floating devices and row and sail boats may be used in certain specified waters, it does not say that they shall not be used in other waters; nor does the entire game law anywhere make any such prohibition as to Long Island and Long Island Sound. The conditions are precisely what they would be if this Sec. 162 were not in existence; it is permissive only, and permissive of something which is not prohibited. Sail boats, naphtha launches, steam launches and floating devices are lawful in Long Island waters.

The Legislature undoubtedly intended to have Sec. 71 apply to Long Island "except as provided in Sec. 162," and this was formerly the wording; but the present phraseology does not carry over to Sec. 162 the prohibitions of Sec. 71.

THE OHIO SUNDAY DUCKING LAW.

From the Cleveland Leader.

ONE of the most trying subjects for the average legislator to understand seems to be the proper protection of game and fish. Other States have the same trouble in this matter that has existed in Ohio, for the incongruities of almost all of the game laws of the various States are notorious. But the experience of the Ohio Legislature in trying to prohibit the hunting of ducks and wildfowl on Mondays and Tuesdays of each week so as to strengthen the law against Sunday shooting is ridiculous in the extreme.

In March, 1887, the Legislature passed a game law which made an attempt of this kind for the first time, and it was published correctly in the book of laws for that year. For several years previous the farmers living in the neighborhood of St. Mary's Reservoir and other inland lakes had been greatly annoyed by the hunters from the cities flocking to these places to shoot ducks and other game on Sunday. When on these trips a great many depredations were committed. The Legislature was finally appealed to, and in March, 1887, passed a game law which provided for the seasons in which game should be killed, and, after prohibiting the destruction of nests and eggs of game birds and wildfowl, the following complete sentence was added:

Excepting in the waters of Lake Erie and the estuaries and bays thereof, no person shall, in any place, catch, kill or injure, or pursue with such intent, any blue-winged teal, mallard, wood duck, or any other duck, on Sunday, Monday or Tuesday of any week, between the 1st day of September and the 1st day of April of any year.

The prohibition of Sunday shooting was thus made a part of the game laws of Ohio, and in order to aid in its enforcement the hunting of ducks and wildfowl was also prohibited on Mondays and Tuesdays of each week excepting in Lake Erie and the contiguous marshes, the latter being owned largely by clubs which do not hunt on Sunday.

At the legislative session of 1888 some member of the Legislature had another amendment to make to the game law, and, as is usual in such cases, cut out the old law, and after putting in his amendment or addition had it printed and passed. The printer, however, made a mistake, and the words "excepting the waters of Lake Erie and the bays and estuaries thereof" were added to the clause prohibiting the destruction of eggs or nests of ducks and wildfowl, the law appearing as follows:

No person shall destroy or disturb the eggs or nests of any birds named in this section, excepting in the waters of Lake Erie and the estuaries and bays thereof; no person shall in any place catch or kill, or injure or pursue with such intent, any wild duck on Sunday, Monday or Tuesday of any week between the 1st day of September and the 15th day of December of any year.

In effect then it was unlawful to destroy the eggs and nests of any duck or game bird except on Lake Erie and contiguous marshes.

During the last session of the Legislature, however, some new fellow saw a point in the game law that he thought needed tinkering. After making the desired tinker he came across the peculiar combination of blunders dating back as far as 1888. He therefore rewrote a part of the section, and after the usual prohibition regarding the destruction of eggs and nests the new law says:

No person shall kill any wild duck on Sunday, Monday or Tuesday of any week on any of the reservoirs belonging to the State of Ohio or in or upon the waters of Lake Erie and the estuaries and bays thereof.

As the law reads now it is unlawful to hunt on Mondays or Tuesdays on the reservoirs of the State or upon Lake Erie and adjacent marshes if they are considered estuaries of Lake Erie, but nothing is said about other parts of the State. In reality, therefore, as great a blunder is made by this new law as was made in 1888, because the inland lakes, rivers and creeks needed this restriction. In all probability the Legislature intended to only correct the blunder in punctuation in the old law, and restore the part relating to Monday and Tuesday hunting as it was in 1887, and it is likely that residents and members of clubs along Lake Erie marshes will continue to hunt on those days as usual. It is very singular, however, that some one cannot be found in our Legislatures who can frame an intelligent and just game law.

PENNSYLVANIA STATE SPORTSMEN'S ASSOCIATION.

MR. H. M. F. WORDEN, chairman of the legislative committee of the Pennsylvania State Sportsmen's Association, has issued the following circular to the members of that committee:

HARRISBURG, Pa., Oct. 16, 1896.—The following committees have been appointed by the chairman of the legislative committee of the Pennsylvania State Sportsmen's Association to draft the various acts suggested at the last annual meeting, held at Harrisburg, Pa., Sept. 3, 1896:

An act to provide for the appointment of a game and fish warden, and prescribe his powers and duties: Jas. H. Worden, Harrisburg, Pa., chairman; F. P. Abercrombie, Williamsport; I. H. Harter, Bellefonte; Hon. J. Ross Thompson, Erie; Thomas S. Dando, Philadelphia; H. W. Nair, Beaver Falls; Hon. Henry D. Green, Reading; Hon. A. F. Thompson, Lykens; C. F. Emerson, Titusville; John M. Kelley, Montrose.

An act, or acts, to make more uniform the game season: J. F. O'Neill, Wilkes-Barre, chairman; James Scarlet, Danville; Samuel M. Downs, Mauch Chunk; W. F. Dittrich, Towanda; Jesse O. Allen, Uniontown; C. F. Brownell, M.D., Stroudsburg; C. J. Jessup, Kittanning; W. H. Burnham, York; H. M. Brackenridge, Natrona; Thomas Nelson, Chambersburg.

An act to regulate the possession, use, transportation and sale of fish and game: J. F. O'Neil, Wilkes-Barre, chairman; James Wolstencroft, Frankford, Philadelphia; John A. Wilson, Franklin; R. E. Shearer, Carlisle; Norwood Johnson, Canonsburg; C. K. Sober, Lewisburg; J. F. Bell, Carmichaels; Hon. R. J. Baldwin, Chadd's Ford; A. D. Sutton, Indiana; R. Van Gorder, Dingmans; J. O. H. Denny, Ligonier.

When the committees have completed their work the bills will be printed for distribution to the various clubs and associations forming this Association and all members of the legislative committee for their indorsement. We trust that all members of the Association will interest themselves in seeing that they are properly circulated and brought to the attention of all classes of our State's citizens. Let us unite for once on an object which affords all classes of our citizens both remuneration and recreation.

There is no subject so generally misunderstood by a large class of our people as that of game and fish as a food supply, it being generally looked upon as belonging to a distinct class of lovers of the rod and gun. It should not be so considered. There are many who never stop to calculate that every acre of waste land within the State is capable of providing food in the shape of game. The hundreds of thousands of acres in this commonwealth now barren of game are the most natural breeding and hatching grounds for certain periods of the year. The results cannot but prove beneficial to all classes of our citizens, and the same is true of our inland lakes and streams.

Liberal as have been this State's appropriations to its fish interest specifically, it is not very creditable to those interested in game to be compelled to admit that it is not a matter of record where one dollar has ever been specifically appropriated for game protection; it is therefore but just and fair to assert that the information and data now in the possession of this committee warrant us in asserting that the value of our game taken annually, and that too without any protection or appropriation for the same, is far in excess of that of the valuation of the fish taken from the waters of the State; the question naturally arises: What would its value be if properly protected?

It would appear to me to be no fault of those intrusted with the affairs of State that these conditions exist, but rather with those who should be interested in preserving our game, that the rich and influential State of Pennsylvania should stand alone among its sister States failing to recognize that its people have a game interest needing protection.

This Association is not an advocate of foisting on the State a system of protection entailing unlimited expenses or leaving a loop hole that they may be created, but does claim that one combining the protection of both our fish and game interests can be inaugurated, and both effectively and successfully carried out, at no greater expense to our State than at present for fish specifically.

I would respectfully refer all doubters of the above assertion to the system now in most successful operation in the State of Michigan; under date of July 27, 1896, I quote from a letter of the State game and fish warden: "I have held the office just a year and a half. So far this year we have prosecuted about 350 cases, making the total record of the office during my administration about 850 cases prosecuted. I cannot give you the exact number, as the reports for this month are not all in."

To perform all this work the State warden is limited to a clause in the act creating his office which reads as follows: "But the number of deputy wardens shall not exceed ten, and the total amount certified by the game and fish warden, and approved by the auditor-general, for compensation and expenses of deputy wardens in any one year shall not exceed the sum of $2,000."

Having every confidence in the good judgment, sagacity, as well as knowledge of the situation by the gentlemen composing these various committees, I shall deem it the part of wisdom not to commit them further or to anticipate their deliberations.

H. M. F. WORDEN,
Chairman Legislative Committee.

RHODE ISLAND SPORTSMEN.

PROVIDENCE, R. I., Oct. 19.—*Editor Forest and Stream:* Allen Stone, of Foster, who has created quite a stir in Olneyville, and in fact throughout the State, by his alleged violations of the game laws in the town where he resides, was in the Eighth District Court a few days ago adjudged probably guilty and bound over to the December term of the Court of Common Pleas, bail being fixed at $500. Franklin P. Owen appeared as his counsel, lawyer H. F. Thompson having acted in that capacity heretofore. The reason of this change was, it is said, a matter of fees. The case was beyond the jurisdiction of this lower court in consequence of the combining of the nineteen cases first put against Stone for having that number of partridges in his possession.

Had the question of W. L. Plaisted's eligibility to serve the warrants upon Stone been argued before lawyer Tillinghast's recommendation that the entire number of case warrants be discontinued, Judge Phillips would have rendered a decision declaring that all elections of game officers by the town councils of Johnston had been illegal, owing to the non-conformance with statutory law, which provides for election in the month of April of four such officers. Mr. Plaisted, by virtue of his legal election in 1892, would have held over, his successor having never been appointed. Plaisted was elected at that time, and having duly qualified, he, under the statute, was still a constable, because it provides that such officer shall hold office until his successor is duly elected and qualified.

The farmers in various parts of the State say that rabbits have not been so plentiful in the woods on their farms for years as they are this fall, and they are now in considerable numbers within a short distance of houses and much-traveled highways. They have become so bold as to visit fields of cabbage, and in some cases have done considerable damage.

Officer Hart B. Pierce, of the Fourth Police Station, one of the best-known coon hunters in this vicinity, returned last week from a ten days' furlough, which he spent in the Green Mountains, Vermont. In company with his brother, George W. Pierce, of Brattleboro, Vt., and another sportsman, they spent a little more than a week in the mountains, with five nights that were suitable for hunting. They were successful in capturing just twelve coons, the largest weighing 34½lbs.

Numerous hunting parties from different parts of this State have been enjoying shooting down in Maine. J. R. Caswell and Messrs. Hay and Wallington, of Warren, shot five deer; John Booth, of Central Falls, got a moose; James Andrews and Charles D. Wood, of the same place, also secured a moose.

Councilman Frank L. Budlong, of Auburn, with his party, consisting of Councilman W. Dean and R. M. Dean, returned last week from a most successful hunting trip in the wilds of Maine. They were gone about a month, and their party is said to have been one of the most successful of the season. Among the trophies of the chase Mr. Budlong has a moose and a caribou, Councilman Dean a caribou, and R. M. Dean a moose, a caribou and a deer. Each man shot two deer, but the one brought home was the only one having a good set of antlers. Mr. Budlong has many souvenirs of the chase about his home and office. He has hunted in many parts of the United States, and is considered one of the best shots in Cranston.

Charles H. Sparks, H. W. Eddy and Irving W. Bliss, of the Maine hunting party from Warren, returned Tuesday. The only deer secured was shot by C. H. Sparks and was brought home. One of the members of the party was hunted by a ferocious moose while experimenting with a new bark moose horn, which proved more successful than desired. The huge animal dashed out of the brush toward the hunter, who fled for the cabin and security. Both the animal and hunter escaped. Dr. Nelson R. Hall, who returned Saturday, shows as one of his trophies a very handsome red fox skin.

W. H. M.

THE RUSH TO MAINE.

BOSTON, Oct. 17.—Never has the big game season in Maine started with such force as this year. Before the opening the reports of game seen were wonderful, but since the opening the number of deer taken has been perfectly marvelous. The season is not of the best for hunting deer, and yet a great many have fallen to the hunters' rifles. Every train from Maine brings deer. The American Express Co. is reaping a harvest in forwarding them. The express train that reaches Boston at 9:30 P. M. is a popular train for sportsmen to return on. That train Wednesday evening had on board twelve deer and a fine caribou head. The same train a day or two before had sixteen deer, and it is very seldom that it does not have two or three. One evening a few days ago there were landed at the Union Station a number of deer, a moose and a bear. The moose is reported to have been killed at the Megantic Preserve by a lady. The bear is claimed to have been fairly shot in the woods and not from a trap, as is too often the case. A number of sportsmen are in the woods after moose, but the number reaching Boston is small thus far. One has been purchased by a well-known market house and cut up for the trade.

The Bangor & Aroostook Railroad is, of course, the great thoroughfare taken by sportsmen, but other roads are getting their share of the sporting travel and big game transportation. The Portland & Rumford Falls and the Rumford Falls & Rangeley Lakes roads have opened a comparatively new route to the Rangeleys, and sportsmen are going in by that route. The other day there were three deer on the down train, with even more on other days. These came from Billy Soule's and the vicinity of the Upper Dam. The blacksmith at the Upper Dam is a good deal of a hunter. He has killed his deer, and John Chadwick's boy has brought down his deer with a .22cal. rifle. The blacksmith went out the other day to get his second deer. Working very carefully, he suddenly came

upon not a big buck, but a big black bear. The beast reared on his hind feet and showed fight. The hunter took good aim and fired. The bear fell and rolled over, but was up and off again in a few minutes. He was followed by the blood 'way up the Cupsuptic Stream, but finally given up. Mr. Swett, the owner of Swett's camps at the Big Richardson Pond, has killed his deer. His son, hunting with him, has also killed his deer.

Over the Sandy River and the Phillips & Rangeley railways the deer are being brought in good numbers. The Franklin & Megantic also opens up one of the best big game sections in the State. When it is considered that all the big game mentioned above has been taken without a particle of snow and at a season when the forests are carpeted with leaves that rustle as only dried forest leaves can rustle, the killing is all the more remarkable, and speaks a good deal for what will be done on the first tracking snows. A deer is a remarkably wary animal, and hard to approach within either sight or gunshot, and for so many to be taken it only shows how abundant they are. It is true that not every hunter who goes into the Maine woods shoots a deer. On the contrary, not more than one hunter in ten succeeds in shooting big game himself. The hunters are numerous as well as the game being transported to Boston and beyond. On the Boston & Maine train, with twelve deer, mentioned above, it occurred to me to count the number of guns and rifles in sight. A friend, to whom I made the suggestion, counted thirty-six. Not satisfied with this count, we numbered again, and the result was over fifty gun cases being transported. There is one feature peculiar to the present hunting season: the guides and Maine hunters are all spending a great deal of time after deer and other big game. At almost every noted camp there is a large deer or two hung up, possibly a moose or a caribou. No sooner does the hunter get into camp than he is offered a deer to take home for a rather moderate price. If the weather is bad and he does not care to hunt, the game is to be had for a little money, and all the honors of shooting big game can be carried home. The unsuccessful hunter has his remedy offered to him at every hand.

Speaking of Maine guides and hunters, their name is legion. Every man and boy is a hunter now. The sale of rifles in Maine is something remarkable. The agents of manufacturers are traveling through the State with rifles for sale. These they offer on the installment plan, selling the rifle for an exhorbitant price, of course. By this means the farmers and farmers' boys get hold of the guns and rifles and the big game must suffer. It scarcely seems possible that the game can stand up under such exaggerated hunting, not only from the citizens of Maine, but from the practiced and amateur sportsmen of almost every other State in the Union. The railroads—the Boston & Maine, the Maine Central, chiefly—are pushing the fish and game interest of Maine to its utmost and the increase in passenger traffic on these roads is remarkable. Even after the summer vacation season is over there is a big sporting traffic going on, and it promises to last this season till the close time on big game. SPECIAL.

A party of Boston sportsmen left Oct. 17 for the Maine woods to spend two weeks in camp at Chase Pond, near Eustis. The following gentlemen were in the party: Hon. H. S. Milton, Col. William Roberts and O. H. Hallett, of Waltham; Chas. Riekenberg and Chas. B. Locke, of Boston; Harry E. Haynes, Wm. H. Butler and Dr. A. Kettembeil, of Brookline.

Ducks at Havre de Grace.

HAVRE DE GRACE, Md., Oct. 5.—The ducks have commenced to visit us. There is quite a number on the Susquehanna Flats, and the prospects for sport look better than they have for many years. If any of the readers of FOREST AND STREAM would like to come the 1st of November to have a few days' sport shooting out of a box or sneakboat on the Susquehanna Flats, and if they will drop me a letter to that effect, I will kindly hire them an outfit for one, two or three days' sport, as we have nearly all sizes of gunning yachts that will accommodate from two to six, with double and single boxes. The box-shooters generally bag from eighty to 150 ducks the first gunning day, and I have known as many as 500 ducks to be killed by one man in one day; but that was many years ago, when ducks were plenty. If any of the readers of FOREST AND STREAM would like to have a few days' sport shooting on the Susquehanna Flats I will use every effort to make them as comfortable as possible in our yachts; and if they will write to me I will charter them an outfit very reasonably, as I know all the owners of the gunning outfits in and around Havre de Grace.

CAPT. E. B. GALLUP.

Stirs to Memories of the Old Days.

A CHANCE issue of the FOREST AND STREAM has fallen into my hands; and reading the relations of the sports of different hunters fires me with the enthusiasms of years gone by. Forty years ago, when I lived in the State of Illinois, the country was a wilderness of prairie; and wild ducks, geese, sandhill cranes, swans, prairie chickens, quail, rabbits, deer and wolves were numerous. Then I was young and full of life, and had glorious sport with the gun.

In 1865, when I came to Iron county, Missouri, game was still plenty—deer, wild turkeys, pheasants, squirrels, and quail by the ten thousand.

But alas! this is 1896. There is no game any more in the former supply. The old-time associates have gone. Old friends are dead or have moved away, and nothing now is left but an old man with a heavy heart.

And yet I thank the FOREST AND STREAM for the pleasant reverie of this hour which its pages have prompted, as they have carried me back to the old, old days.

C. T.

MISSOURI.

Snaring in Massachusetts.

MR. HENRY J. THAYER, secretary of the Massachusetts Rod and Gun Club, writes: "May I, with your permission, take exception to that portion of an article in your last issue referring to a prosecution by the new rod and gun club as for a violation of the Sunday law? The case was for snaring ruffed grouse, and is, I believe, the first successful prosecution in this State; and it was accomplished only after about three weeks' persistent work."

We trust that this may be only the first entry in a long list of successful prosecutions by the club for snaring.

Call Ducks.

MURPHYSBORO, Ill.—I live where for thirty years we have enjoyed the best duck shooting in the world, until the drainage district was organized three years ago. I have hunted Big Swan Lake and Little Lake and the glade land below them, commencing with the old muzzle-loader soon after the war and now with the best improved guns and methods of wildfowl shooting, and I believe I can give some information about call ducks.

Don't you ever think that you have to import ducks to make callers? On the contrary, put $3 in your pocket, stroll down through the market and look at the coops of ducks exposed for sale, and if you know a mallard duck when you see it you will have no difficulty in picking out eight good representitive drakes. Then look out for four hens, getting those as near the color of the wild duck as possible, and if you can find any small rather light brown hens, with a white stripe on the cheek, don't fail to secure them. Here in Illinois we have plenty of them, and I suppose you will find them in almost any market. They have proved to my knowledge the best and most incessant callers that I ever handled. But no great matter if you don't get them; it is all in handling decoys.

After you get on the shooting grounds it will be necessary at first to confine your ducks for a few trips; that is done in various ways, some by anchoring by the leg, others by a collar around the neck, depending upon the nature of the ground. After you have all your drakes and two of your hen ducks placed in a conspicuous and at the same time natural position, take your two hens that you have left and anchor them behind a log, or tuft of grass, or brush blind where they cannot see the drakes, and they will call whenever they hear the drakes or see wildfowl or even a woodpecker fly over. After a few times out you can turn loose all the drakes and only confine the hens.

Mr. Mather asks who ever heard a pin-tail or sprig-tail call. Well, if he will come to southern Illinois in March or February I will convince him that they not only call, but are fully capable of making themselves heard.

BUCKSHOT.

Game in Western Pennsylvania.

BURGETTSTOWN, Pa., Oct. 10.—Squirrels are the only game in season at the present time, and they are very plentiful; bags are made from five to twenty-five to one gun in a day. Signs for rabbits and quail are very bright. The ruffed grouse is nearly a thing of the past in western Pennsylvania, one or two in a day's travel being all a man can start in the same country where ten years ago one could start them up with from ten to twenty in a bunch. The fishing in the vicinity of Burgettstown this fall has been exceedingly good. Two men caught 25lbs. of bass in four hours, ranging from 1 to 3lbs.; this is good for this stream.

Why cannot the sportsmen of Pennsylvania have as good game laws as they have in Maine? We could have just as many deer if we had the laws. Deer preservation has been argued pro and con in the FOREST AND STREAM, and the only solution is to quit killing and marketing of does. Over 100 deer were brought to the markets of Pittsburg last season, and 90 per cent. of them were does. There are plenty of deer in the mountains of Pennsylvania for stocking purposes if given any opportunity, and they would soon become very plentiful. If there were a law to prohibit the killing of does for five years we could get deer within three hours' ride from Pittsburg.

If anything is to be done for the ruffed grouse in this part of the State it must be done soon, for there are not enough left to stock the covers. We hope that this will be the means of having some one with more ability than we have take it up where we leave off. We would like to hear from some old hunters of their experience in Pennsylvania in late years. Let us see what we can do toward getting better game laws before it is too late.

Ruffed grouse and quail have already made their appearance in Pittsburg market. The law is supposed to protect them until Nov. 1. J. K.

Minnesota Game and Fish Protective Association.

ST. PAUL, Minn., Sept. 24.—*Editor Forest and Stream:* Under the revised constitution of this Association, Section 3 of Article 3 has been inserted in order to secure the support of all local rod, gun and protective clubs for the Minnesota Game and Fish Protective Association, in order to further protect the game and fish of this State.

As a sportsman you will recognize the value of concentrated effort. There is more to be gained by educating our citizens as to the real value of our game and fish products as a food supply, and in having local protective clubs to deter persons from violating our game and fish laws, than attempted prosecutions in some districts where it is hard to get a conviction because of present public sentiment.

The secretary of every local club allied with this Association is made a corresponding secretary and may be called upon to act at any meeting of the State Association.

We ask you to bring this matter of co-operation before your club at an early date. WM. L. TUCKER, Sec'y.

Newfoundland Deer Seasons.

THE Newfoundland open season for deer (caribou) as given in the current edition of the *Brief* is divided into two parts, the first extending from July 15 to Oct. 7, and the second from Nov. 10 to Feb. 1. This, Secretary Emerson, of the Game Society, writes us, "is looked upon at present as merely experimental, as a wide difference of opinion existed among experts and others who gave their testimony before a select committee of the House of Assembly as to the time when the rutting season really commenced. After this year we shall probably be in a better position to know whether the present law on the statute book is the best we can get for the preservation of the caribou."

The season before had been from Sept. 15 to Feb. 15. The new schedule will of course be more inconvenient for foreign sportsmen.

An Adirondack Guide in Canada.

ELIZABETHTOWN, N. Y., Oct. 15.—*Editor Forest and Stream:* Horace Braman, well known as a Keene Valley, N. Y., guide and a successful deer hunter, has gone to Upper Canada to spend a month hunting moose.

G. L. B

Vermont Game Birds.

SHELDON, Vt., Oct. 10.—A few fall ducks have arrived, but no wild geese. The flight of woodcock has been a light one. Our native-bred birds migrated before the season had fairly opened, so our woodcock shooting has been so far nearly nothing. There are plenty of ruffed grouse. They stick during the middle of the day to the swamps and dense thickets, so while we have had plenty of shooting, no heavy bags have been made.

STANSTEAD.

Sea and River Fishing.

MEN I HAVE FISHED WITH.

XVII.—Antoine Gardapee.

IT is possible that there may be another way to spell this name. Antoine never spelled it, but then he couldn't spell any other word; so we just take it as it sounded. After the time when he killed the doe that was with my buck we often met. Early in October I dropped into his cabin and found him overhauling a lot of steel traps, putting in a rivet here and there, filing the catch to hold the pan stiffer or to make it go off easier, as seemed best. His back was to the open door, and I watched him a few minutes before announcing my presence by knocking on the door frame of his little log shanty. He whirled around on the box which served as a bench and said: "Come in! You jess a man I want for see. Whar you be'n so long tam? I was go for look you up."

"I've been working hard for the past week and have not been up the river until to-day, when my partner, Guyon, wanted a day off; so I thought I'd drift over your way and see if I couldn't get a deer, but haven't seen any fresh sign this morning. About a mile down the river a big flock of geese got up and came over my head very low, and if I had had a shotgun I might have got three or four, they were so thick; but here's one that dropped."

"You don' eat heem, he's a t'ousan' year ol'; look a here," and he tried to tear the skin under its wing with no effect. "I'll tole you, give a-heem to ol' Miss'r Knight; he's tough too. How much a-mineral Charley an' you clean up dis a-week?"

"Oh, we had a big week and cleaned up about fifteen hundred. Why?"

"Yas, all drif'; nex' week you don' get noding, hey?"

"Perhaps so, but that's miner's luck; we can't expect to get as much every time. It's the biggest week we've had, and only five days at that."

"You like-a dat work—no?"

"No, I don't like it; but it helps a fellow to live."

"I tole you. You go 'long o' me dis winta an' trap. You haf good time an' make more dan dig fur de lead. I no dig fur lead."

And so it happened. He was getting ready to spend the winter in the wilds of the Bad Ax county to trap. After hearing his scheme I agreed to go with him and we started in to get ready. He had all the steel traps necessary for small animals and was an expert at making dead-falls for the larger ones. We drifted down to Dubuque, where we put our boat and other things on a steamer for Prairie du Chien. From that place we took a supply of provisions, mainly of flour, coffee and sugar, for Antoine said we would not need pork nor lard because we could get fat from coons, ducks and perhaps other animals. Our outfit was simple, but it loaded our boat and two heavy tarpaulins protected the provisions. It was a hard pull up the Wisconsin River some twenty miles to the mouth of the Bad Ax River, but we took it easy and the second night we camped a mile or so up the Bad Ax. This camp is memorable because of a storm which wet us to the skin, but the provisions and the ammunition were kept dry.

We went on up the little river some fifty miles, more or less, hauling over or around falls, when we hid our boat and a portion of the provisions and started on foot to some spot which Antoine seemed familiar with, for he said he had been over the ground before. The way he stored the provisions was curious. After dragging the boat back from the river we hung it bottom side up between two trees and then put out lines from each side to prevent it turning over. Then we cut poles and made a shelf on the seats, covered these with a tarpaulin and stored our provisions in the boat.

"Now," said Antoine, "Miss'r Bear, Miss'r Coon and Miss'r Mouse, you doan git no flour and you doan git no sugar, an', Miss'r Rain, you doan spile noding."

We took our rifles, a frying pan, axe and some flour, coffee and salt, and started up the river into the Bad Ax country, which some man with no regard for historic names has had re-christened "Vernon county," a change that destroys the individuality of the county, for there might be forty Vernon counties in the United States, but there would be only one having the old name which savors of the settlement of the region by the whites and had the merit of being unique. I have no idea how the old name came to the river and afterward to the county, but will predict that some man with a little poetry in his soul and a love for originality will arise and have the historic and beautiful—I say beautiful advisedly—name of "Bad Ax" restored to the county. I really don't know if the river has been renamed, but hope not.

We selected our camping spot some few miles above the fork of the river, on the east branch, where several small streams came in. There are, no doubt, names for all these now; we had no map and no name for anything but the main river, yet we named them for our own purposes, that was necessary in order to be understood, and I elaborated a map on my powder horn which showed all the streams, swamps and hills to the best of my ability. This horn was left in Potosi, as of no further use. Just what I would give to see it hanging on a wall of my den to-day I cannot say. We measure the things of the moment by their utility or their cash value, but those of the past which formed a part of our lives become treasures beyond price when they serve as links to connect us with a time far removed. A sword that was "held by the enemy" for over a quarter of a century is on my wall. It may be sold for old junk, but not before I am put to bed with a spade and sodded over.

Let's see; we were talking about an old powder horn. It cost only the time to bore out the tip, fit the bottom and to polish the thing—a mere nothing—but it's so easy to get off the track. I was only going to say to the boys to-day Never throw away anything that you can keep.

A trifling thing becomes priceless after forty years have passed. That's all!

When the old trapper threw down his load and said, "We make here our house," his partner, who had begun to think that there was no end to the journey, rejoiced. On a little knoll we laid the foundation for the cabin. Antoine was one of those men who are so handy with an axe that you wouldn't be surprised to see a clock made by him with that tool alone, and he measured and notched the logs and showed me how to put the small ends, that made the sides, to the rear and so help the slant of the roof. He split the long 3ft. shingles, a few "puncheons" for part of a floor, on which we slept, and also for the door frames and the door. We chinked the logs and plastered them with clay mixed with coarse grass, made a fireplace and stone chimney, and then we were in a 10×12 cabin with a shed roof on which was piled a lot of grass kept in place by weight poles. A stone oven was made in the fireplace where we could not only bake bread, raised with cream o' tartar and soda, but could also roast a goose or a venison ham.

Not until we began to build our camp would the old man let me kill a deer, although we saw plenty of them, because he said that we could not carry any part of it; so we had lived on partridges, rabbits and a coon on the journey, and a change to venison was good. The bed was made with hemlock boughs on the puncheons, and covered with a tarpaulin and blankets. A swinging shelf was made to hold the remaining provisions secure from rats or other intruders, and we started down stream for supplies, taking only one rifle, an axe and enough salt, matches, etc., to last a week, for we had been three days going up from the place where the boat was left. After a two days' tramp we found our provisions as we had left them, and loaded up again and started for camp. Just how it happened, no one knows; my rifle had only one trigger, and that could be "set" by pushing it forward, and the "set" was so light that a breath would almost let it off. Of course it could be used without the "set," and then it took about a 2lb. pull to let it go. I had started ahead, and in my pack was the frying-pan, which projected over my shoulder alongside my head. Suddenly a shot startled me close to my ear, and on looking around at Antoine he said: "What for he go so easy? I t'ought I kill one pa'tridge on de tree yonder, an' I on'y make a hole in dat fry-pan; de t'ing go off too quick, an' I mos' kill you, hey?"

The grouse had not stirred, and I loaded the rifle, showed Antoine how a single trigger could be set to a "hair," and he picked the head off the partridge, saying: "Ba gosh! he go so easy as a gun wit' two trigger; I doan on'stan' dat." He learned the trick, and after beating down the edges of the hole in the frying-pan and putting in one of the trap rivets and battering it down with the poll of the axe we went on. It took four trips to get all our plunder from the boat to the camp, and the snows had fallen before the last one was made, and our snowshoes were worn instead of being carried, for without them we would have been there until spring, for the snow was 2ft. deep and still falling when we reached our cabin. To our surprise there was smoke coming from the chimney, and when we opened the door there was an Indian cooking a rabbit by the fire.

He arose, shook hands with Antoine and then with me, and the Frenchman and he sat down and talked in the Ojibwa tongue for a while, and then my friend explained the matter in this way: The red man was an old acquaintance who had found our camp and entered, as was their custom; he knew Antoine's rifle, saw that the camp was new, and waited for our return. He tapped his breast and said to me, "Nidgee," which I understood to be his name and so called him, although I afterward learned that the word meant simply "friend."

It is difficult to get at the way these Indian words should be spelt; for instance: They call themselves O-*jib*-wah and the white man first twists it into Ojibway and then into "Chippeway." The word which I spell "Nidgee" is sometimes given as "Nitchee," and so it goes; it's a question of how it sounds and how it may be twisted at second hand. When I was among them they pronounced the tribal name with an almost imperceptible "O" and the accent on the second syllable, as given above. Our red friend came and went at intervals all winter, never saying a word at leaving and only giving a salutary grunt on arriving. Antoine explained that his friend's name was Ah-se-bun, or Raccoon, and that he was a good man to know; I gave him a big plug of tobacco and we were friends.

After getting settled in good shape and the cabin well fixed for the winter we started to put out a line of traps up a branch of the little stream, which was to be my line. We were gone three days, and had good dry weather, and only covered about thirty miles in all—fifteen up one stream, then over a divide and down another, which came into the first one near our shanty—but we set about forty steel traps of different sizes for otter near falls and rapids, for mink under tree roots and other covered places, and for "black cat," pine marten and ermine in their haunts. We made many dead-falls for some of these animals where it was possible to drive stakes or arrange them on stumps, and for these we carried bait of venison and fish. This was my first three days on snowshoes, and the weight of them, added to the unusual gait which they require, made some muscles that had not been used to a loping gait very sore. But the truth came out when we reached the cabin and hung the snowshoes up, for Antoine asked: "You tired, hey? I t'ink t'ree day' on snowshoe' pooty good fur fust time; he make me sore fust, but, like de skate, you git used to dat kine, an' bime-by you t'ink de snowshoe de best fur de walk. Jess so me w'en I be in de wood all winter. W'at you say, hey? S'pose we res' two, t'ree day' an' fish, den I go put my line o' trap an' you run yours; what you say, hey?"

"Well, Antoine, I do feel tired in my legs, and if you are tired too I'll do just as you say. We'll fish a day or two and get a change of feed and then you go and lay out your line and I'll run over mine."

This put it in such shape that the tired feeling was mutual, as indeed it was, for the first skating or snowshoeing of the season strains muscles in an unusual way. And we rested and fished. We used bits of venison for bait, and laid in a stock of trout and some other small fish, which we stored in the snow when frozen.

A portion of a deer had been hung on the north side of the cabin, and it had been torn and picked in a way that neither dogs, wolves nor bears could nor would have mutilated it, because the tearing had been done from the upper side. I called my partner's attention to it and suggested that ravens had found us out.

He looked at the meat and said: "Miss'r Raven he doan lak come near shanty, but dem mis'able meat hawk he come an' take de meat out yo' mouf. I hate dat cuss, de meanes' bird in de wood 'cause he no 'fraid. You keep a' eye out an' see how I fix him wid a flip."

I saw the bird the same day. It was the "Canada jay," "meat hawk," "whisky jack," etc., a relative of our blue-jay, but not so noisy. As I have since known this Northern bird on its extreme Southern limit in winter, in Michigan and Minnesota, it is of an ashy gray color with black and white markings, and so unfamiliar with man as to be impudent, and therefore very interesting. This is all very well when a bird visits you in a winter camp where birds are scarce, and one drops down by your feet, hops around and swipes a venison chop or a fish which has been laid out ready for the pan; but when it invites all its sisters, its cousins and its aunts to a feast on a saddle of venison which you have left out for safe-keeping entirely for your own purposes, the familiarity of the bird breeds a feeling which differs from contempt. Somewhere back in memory the word "flip" seemed connected with some sort of a beverage, and I imagined that Antoine intended to give "whisky jack" a drink that would paralyze him; that was a natural conclusion, although we had no whisky.

"I tell you; come see me fix de flip; he come here for heat my meat an' he'll get de flip; I fix him." He removed the chinking from between the logs for a foot and ran out a long shingle and put a piece of meat on the outer end. Soon the enemy alighted on the shingle, when down came the ax on its inside end, and a dead "meat hawk" was tossed in the air. "I tole you he got de flip—he want no more, an' now all hees brudder got to get de flip an' den we got no trouble no mo'." During our three days' rest we killed about twenty with the "flip," and went our rounds of traps knowing that there were a few less meat hawks to prey upon our stores.

I stayed in camp alone for three days after our rest, while Antoine went over his line and set his traps. The first trip was the greatest labor of all, for it involved selecting places and building dead-falls, but I was getting my tired muscles into condition by a rest which was merely a change of occupation. The rifle was to be cleaned and oiled, knives were to be sharpened, wood to be cut, bullets to be moulded from bar lead, and other things to be done, besides cooking and washing underclothing.

While fishing in the stream on the third day after Antoine left, there suddenly appeared seven Indians in company with my friend Ah-se-bun. None of them could or would speak English, and after a repetition of the word "Tah-so-je-ge" and some gesticulation I began to understand that they were asking for Antoine. Later I learned that "je-ge" meant "he who does," and that "tah-so" referred to traps. As I gradually picked up some of their words and tried to use them, I often began a sentence to Antoine with "Nidgee Tah-so-je-ge, would you like fish or venison?" etc. That day when I was found fishing my red friend had named me "Kego-e-kay," or he who fishes, and I arranged with Antoine to always use the native tongue when possible; and before spring it was our common camp talk, he helping me over the hummocks. I entertained our red friends as well as possible, and their appetites were enormous. Antoine had fully informed me on all the points of Ojibway etiquette, and when I offered tobacco the exact amount was cut off and handed to each individual, or he would have considered that the whole plug was given him; and the same circumspection was necessary when a loaf of bread was cut.

I tried to get our visitors to follow Antoine's trail and meet him, as the prospect of feeding eight hungry Indians was not pleasant, but they waited. I had two loaves of bread: one for me to take next morning when I ran my line, and one for supper when Antoine came. A venison ham was boiling in the fireplace to have for supper and breakfast, and to keep me three days if necessary; but when I got ready to set it out to our guests Antoine came in. There was a grunting salutation, and then Antoine said: "I don't bin hungry, but ba gosh if I'll bin starve; it was good I come now 'fore dey heat all dat grub we got. You don't know w'at happetite dey got, I'll tole you." And I certainly didn't know. Antoine first cut bread and meat for himself and me, and then divided the rest into eight portions, which were hardly chewed, and had disappeared before we had fairly begun.

Antoine then told me: "Dey ha'n't had half plenty, but dey all say 'nish-ish-shin,' dat means 'good.' We doan got much meat, on'y for you t'ree day, an' I doan cook no more."

A smoke followed, and then it transpired, as Antoine translated it, that one of their friends had somehow broken his leg and they wanted him to go and set it. The distance to their camp was only five miles, and if I didn't mind he would go at once. It seems that he had a reputation for surgery among these people, and I had three good reasons for wishing him to start immediately. Of course the humanity of fixing the man's leg was one reason, keeping on good terms with men who could rob and destroy our traps and drive us out of the country was another, and I fear that the third was to get rid of guests who would devour our small stores and breed a famine was as strong a reason as the other two.

After the exodus I cooked a partridge and some venison chops to take on the line, baked two more loaves of bread, and had the kettle boiling to make coffee when Antoine should return. A light rain the night before had made a crust upon the snow and snowshoes were not needed. It was long after dark when his step was heard crunching in the crust, and in he walked with his rifle and a coon. I told him that it was well that he had the coon, for I had cooked all the meat in sight, and there was only enough for our supper and for me to take on my trip. There were fish enough for breakfast and now there was coon fat enough to fry them in. In the words of that old hunting song of Mr. Raynor's: "Why should the hunter lack?"

Antoine said: "Dat make no diff'. W'en I'll got hunger I'll catch de feesh or I'll kill a deer or pa'tridge, or I'll go hunger. It makes no diff', I'll come along, you doan min' me, no."

After supper we smoked in silence. I had said all that could be said about the camp larder in order that he might not put off replenishing it before he got hungry, and was anxious to know all about the broken leg and why so many Indians were so close to us. Not a question would I ask of the old man. He would tell it all in his own way if left alone, and would be better satisfied to do it in that way. We sat in front of the log fire on three-legged stools which his axe had fashioned, and smoked in silence until he said: "Han' me that plug tobac." I passed him the tobacco, and he slowly sliced a pipeful, ground it in his palms, filled his pipe and lighted it with a sliver from a dry pine stick. I emptied my pipe and followed suit. As he contemplated the smoke curl up and mingle with that of the fire, he removed his pipe and said: "Dese Injun jess lak w'ite man, some smart an' some tam fool." He was thawing out, and to assist the process I kept silent and let him go on thinking until he got ready to tell as much as he wished.

After a few more puffs he said: "De big fella dat was here hees name was 'She-kog,' an' dat mean de skunk, but he ain' got no sense like a skunk. All dese men dey go on up on a Flambeau riv', dey no stay on a Bad Ax riv', an' She-kog he go fur to break a stick an' hit O-ge-ma, the head man, an' broke his bone in his O-bwam, w'at you call dat bone here?" indicating his thigh. "Well, when I foun' ole O-ge-ma he say 'ugh'* an' I feel hees laig. Sho 'nuff she was broke. I get some wood f'um dry pine an' make splits an' tear up blanket, an' den I take hees foot in bote han's an' put ma foot in hees crotch an' I pull lak de dev' till bones slip togedder an' I feel 'em all rite. Dan de woman win' hees laig in blanket an' I put on some split wood an' more blanket an' hees laig it get all rite. Dey go 'way in mornin' an' carry O-ge-ma 'longside. Gimme dat tobac."

In the morning I started to run my line. Two days would do it easily if the weather was good, but rations for three was a wise provision. A rifle and ammunition for a dozen shots was also needed. Matches in a vial, blankets, some strong twine and a belt axe completed the outfit, except the snowshoes, which were slung on the back in case of need, for the crust might soften or fresh snow might fall, and snowshoes were now in the same category as the traditional pistol in Texas. This made a fairly good load for a novice and it was increased by several skins before noon.

Night came; and as I ate supper by a little fire and crawled under my blankets with my feet to the fire and the upper half of my body in the hollow of a big tree there came a sense of loneliness that is indescribable. Perhaps there was some fear, but as near as I can recall it the main feeling was one of helplessness. The night was still, cold and clear. The stars shone through the top of the leafless, hardwood trees. I looked over the rifle. It was a big and tolerably accurate one; the cap was sound and—"Pshaw!" I thought, "a man armed as I am is the most dangerous animal in these woods, now go to sleep." That was truly philosophical but—philosophy and sleep are not identical. Not a twig or an acorn dropped within hearing that escaped my over-sensitive ear. The fire was replenished several times and it seemed as if day would never come.

If I lost consciousness for a moment that night it must have been the briefest of moments. Camping out with Port Tyler and the boys on that creek—whose name I dare not spell since the dispute—was one thing, but this was different. Every owl that ventured a remark seemed to be making reference to me. If a rabbit ran on the hard snow and cracked his joints as a call or challenge I heard it—but then the fact is I was not sleepy. No man can sleep when he isn't sleepy, there's nothing queer in that.

Near daylight I was startled by the tramp of some animal and I sat up and listened. The sound came from the stream below, which glinted in the starlight, and I made out a moving form going down stream. I thought it must be a bear and if I could kill it then life would be worth living, if only to tell of it. I stood up in the hollow of the great tree and tried to get the rifle sights in line with the animal's forequarters, but the diffused light from snow and stars made it seem impossible to tell where the gun was sighted. The thing stopped; it had probably scented my camp, and partly at random I fired. A mingled cry and growl, a floundering in the snow and a hasty reloading of the rifle followed. On reaching the spot, not more than 50yds. distant, blood could be seen on the snow and I followed. Morning was visible in the east and by the time the sun was up I had run down my game, which was weak from copious bleeding. It turned at bay. It was not a bear, but what could it be? It made a feeble charge on me, which I dodged, and then dropped it with a bullet in the head. Now that it was dead I had no idea what it could be. With lions, tigers, elephants and other animals of Asia and Africa I had knowledge, but here was a beast in an American forest of which I had never heard nor read of in my school books. It was bear-like, but not a bear. Its body was heavy, its legs thick and clumsy, its tail bushy and it had a round head with eyes wide apart. The hair was shaggy and thick, the color being almost black, with a light stripe along the sides which met at the insertion of the tail. It was about 3ft. long and might have weighed 150lbs. This is how I remember it, and under such circumstances a young fellow with tastes of the naturalist notes such things. I skinned the beast, and the smell of the meat said plainly that whatever this thing may be there is a flavor to it that you would rather starve than eat. It was an odor like that of mink, weasels and other beasts of prey, or rather those which live on flesh exclusively—for the flesh of the bear, coon, hog and other *omnivora* have no such smell. One hindleg had been broken and the other injured, a most fortunate shot in the uncertain light and one of pure and unadulterated luck.

After a toilet in the brook and a good breakfast—such a breakfast as only one with an appetite such as I had, after the morning's work, can appreciate—I crossed the divide and struck the other stream, which led homeward; yes, that's the word; it was home now. Soon I came to a dead-fall which had been wrecked; the back of it had been broken into and the bait taken. I thought that some animal had approached it from the rear, and in ignorance that the other side was open and that the trigger held a hospitable log, which would induce him to remain by falling and breaking his back, had considered that the only way to get at the desired bait was to break in from the side he first came to. After finding a dozen or more dead-falls entered in the same manner I began thinking. The more I thought of the matter the further I was from any conclusion. The crust on the snow was

---

* This Indian salutation has been anglicised into "how" and further polluted into "here's how."

now too hard to show any tracks except of deer, whose small hoofs cut through it and often left bloody marks where the crust had retailiated.

When I reached camp, Antoine had just finished his laundry work and was hanging it up. Here I want to tell the young boys that a trapper's life is a hard one aside from the exposure in running lines of traps. With two it is lighter because of a division of labor, but to run a line two or three days, skin, stretch and then flesh the skins so that particles of fat do not injure them, cook for yourself and partner, wash your underclothing, mend clothes, moccasins or shoe packs and snowshoes, besides cleaning guns, running bullets and doing the hundred and one things that must be done, keeps one busy every hour of daylight and often afterward. It is an independent sort of life, free from being bossed, but it is hard work in a healthy climate and full of adventure to one who loves it.

Antoine looked over my skins. They comprised one otter, two mink, one ermine or white weasel, one fisher or "black-cat," which he called o-jig, and is a strange animal of the mink or weasel family which the naturalists know as *Mustela canadensis*, but is also called "pekan" and other names. There was also a foot and part of a leg, saved for Antoine's identification, which he called sable, an animal better known as pine marten. Then came the skin of the unknown beast. When he saw that he jumped up and yelled. Then he shook hands with me and said: "You b'en done it; you killed de ole dev', old Carcajou; he break all de trap you set; he know all 'bout trap an' he go in on hin' end and steal bait. He follow all you' track to all you' trap, and w'en he fin' he break 'em mebbe he steal 'em. Oh, he spile our trap all a time, but you got-a heem. Shake."

A day spent in stretching and fleshing skins, and then Antoine started to run his line. Our bake oven had fallen in and I brought better stones from the brook and built it anew in the fireplace, cooked my dinner and supper from the carcass of a deer which Antoine had killed and dressed, sat by the fire, smoked a while and turned in and slept the sleep of the just. Tired and worn out, acorns might fall, rabbits might snap their legs and wolverines might prowl around. I had killed a wolverine, a stealthy night prowler that from pure deviltry destroys the work of the trapper, and that was glory enough for a first trip. I have no remembrance of any dreams that night. I could have said with Sancho Panza:

"Blessings light on him who first invented sleep! it covers a man all over, thoughts and all, like a cloak; it is meat for the hungry, drink for the thirsty, heat for the cold, and cold for the hot; in short, money that buys everything; balance and weight that makes the shepherd equal to the monarch and the fool to the wise; there is only one evil in sleep, as I have heard, and it is that it resembles death, since between a dead and a sleeping man there is little difference."

The sun was high when I awoke and by my side stood Ah-se-bun; but I'll tell you about that another time.

FRED MATHER.

PENNSYLVANIA ASSOCIATION.

PHILADELPHIA, Oct. 17.—The regular monthly meeting of the Pennsylvania Fish Protective Association was held on Tuesday evening, Oct. 13, 1896, at the rooms, 1020 Arch street, Philadelphia.

The report of the executive committee showed commendable progress in suppressing several infractions of the fishery laws reported, efforts to promptly correct same being retarded through the difficulty of obtaining direct information. The committee have under consideration several measures for more effectually dealing with such cases in future.

A special committee will shortly proceed to Baltimore to confer with the Maryland State Game and Fish Protective Association with a view of urging the enactment by the Maryland Legislature of more stringent laws for the protection of fish in the Susquehanna River, the Maryland Association being in perfect accord with this Association in desiring the river cleared of all obstructions.

Mr. Wm. P. Ogelsby was unanimously elected a member of the executive committee to fill the vacancy caused by the decease of Henry C. Ford.

Through the aid and influence of the Association, organizations of kindred character were successfully formed in several counties of the State.

The following resolution was adopted, ordered to be spread upon the minutes and a copy forwarded to the family of the late Hon. Henry C. Ford:

This Association with sincere regret makes this minute of the death of the Hon. Henry C. Ford, late President of the Pennsylvania Fish Commission, and ex-President of the American Fisheries Society, and who was also one of the original and charter members of this Association.

His continued interest and efficient co-operation in our work made his services invaluable, both as a member and as chairman of our executive committee.

In his death this Association loses one of its most valued members, and the loss of his services to the fisheries interests of our State and nation will be deeply felt and regretted by all who have made the improvement of those interests their serious and earnest thoughts.

We desire therefore to testify our deep feeling upon the decease of our friend and associate, and make this minute in accordance therewith.

M. G. SELLERS, Sec'y.

Bass in Central New York.

ITHACA, N. Y.—Anglers are having a splendid turn of sport with the elusive black bass at present, some very handsome scores coming almost daily to hand. The favorite local bass grounds until cold weather sets in with a lasting icy grip will be along the east shore of Cayuga Lake, extending northward as far as Esty's Lookout. Minnows are the most effective bait, although Mr. Arthur Miller, of this city, a real, Simon pure descendent of dear old Uncle Walton, tells me that he has lately taken black bass with the plebeian worm as lure. And as Miller speaks the truth of Anglers' Alley, both worms and minnows may be recommended as bass bait from now until the season closes. Some big carp have lately been taken, but as a whole the autumn carp angling has not been A No. 1.

M. CHILL.

Salmon Rivers and "Muck-a-mucks."

Editor Forest and Stream:

IN your issue of Aug. 29 a Mr. Woodle, of Boston, gives a glowing description of the angling on the St. Marguerite, a branch of the Saguenay, by Mr. Blanchard, the owner of some high pools. I wish to call your attention to one paragraph of Mr. Woodle's. He declares the St. Marguerite equal and quite as productive of good sport as the Restigouche and its tributaries, "where the nobles of England and the high muck-a-mucks of Canada wet their lines."

Times were when such Canadians owned or leased the river as Sir H. Allen, Sandford Fleming, C. T. Brydges and Lord Mount Stephen. We had Lorne and Louise, Argyle, Elcho, Beaufort, St. T. McNiel wet their lines in the famed old river. But times are changed. Riparian rights enabled the American millionaires of New York and Boston to buy and lease nearly all available spots upon it, and the only poor muck-a-muck Canadians who have a foot upon it are Dr. Campbell, W. McPherson, I. H. Starnes and Mr. Ives. But I am proud to say the gentlemen forming those clubs are very generous to a stranger, either of noble or plebeian blood, with a day's fishing.

This Billingsgate slang to us Canadians shows his breeding and animus, and could only emanate from some disappointed tail-twisting Fenian. No American gentleman would use it. I am, sir, yours, etc., etc., a Scot and Canadian, JOHN MOWAT.

[We regret extremely that Mr. Mowat should have taken what appears needless offense at the expression "high muck-a-muck," which, by the way, is not in Mr. Woodle's note, but in the account he sent us taken from the Boston *Globe*. We do not find "muck-a-muck" in the dictionaries, but confess to having heard the expression used, not as a term of derision, contumely or reproach, but as a slangy (and perhaps—but not necessarily—irreverent) appellation for one high in position or authority. It may be Billingsgate in origin, but we are rather inclined to account for it as pure Bostonese; and it is likely enough a corruption of the Algonquin *mogguomp*, chief, which we have in English also as mugwump.]

Who Owned this Fish?

MICHIGAN CITY, Ind., Oct. 11.—*Editor Forest and Stream:* It is a common occurrence for two gunners to bring down a bird whose ownership it is difficult to decide because they fired at the same instant, but never until a recent experience of my own have I known of two anglers catching the same fish.

I was recently at Star Lake, Wis., having a taste of about the last bass fishing of the season in that locality. My friend, Mr. A. F. Merrill, of Chicago, accompanied me, and we were both fishing from one boat, casting with minnows in toward an old tree top near the shore, letting our bait sink for a few moments after each cast. I had a bite and after waiting a few seconds struck, hooking my fish, as I could plainly feel. The boatman immediately began backing the boat out into deeper water to clear the submerged tree top, while I worked my prize in the same direction. Mr. Merrill, fearing his line might foul mine, concluded to reel in. While doing so he felt a fish take his bait, and I heard him exclaim: "Halloo! I have one also."

We each worked our respective fish toward the boat, but when they came within reach of the landing net, behold, it was one and the same black bass. I had him securely hooked on one side of his jaw, and my friend's hook was just as firmly fastened in the other side.

It is plain that while I had him hooked he saw Mr. M.'s minnow drawn by as it was being reeled in, and could not resist the temptation to seize it, even if he had an annoying little piece of steel in his jaw at the time. He weighed a little over 2lbs.

Star Lake is a pretty sheet of water at the terminus of one branch of the C., M. & St. P. Ry. in Vilas county, Wis. There is a good log hotel and in the season the fishing is excellent. GREENHURST.

San Francisco Fly-Casting Club.

SAN FRANCISCO, Cal., Oct. 10.—*Editor Forest and Stream:* A series of ten fly-casting contests is about drawing to a close, and when completed I will see that a synopsis of the work done during the series is forwarded to you.

In each contest there are three events: 1. Distance; 2. Distance and accuracy; 3. Accuracy and delicacy. The rules governing the contests will soon be printed and I will take pleasure in forwarding to you a copy of the same.

On Nov. 7 the San Francisco Fly-Casting Club will hold an annual tournament, open for all, which tournament will consist of the three events above mentioned. A championship medal of gold in each event will constitute the first prize. A Leonard, a Kosmic and a Malleson, each donated by the makers, will constitute the second prizes in the events. The third and fourth prizes to be made up of donated newspaper subscriptions and merchandise donations. W. D. MANSFIELD, Pres.

Did not Buy Him a Ticket.

CARRABASSETT, Me.—*Editor Forest and Stream:* Allow me to make a correction of the sketch "They Bought Him a Ticket to Get Out," in your issue of Sept. 12. The party represented as "trout butchers" numbered four. There was no ticket bought, nor talk of buying one, nor had it been mentioned in any way till it came out in your paper. The story probably originated in the fertile brain of the man who told Dr. Criado that two years ago he had shot twelve deer, and the truth of the matter is that he has never been known to fire at one. It seems a pity that such stories are told to people who know nothing of the truth of them, as it tends to drive people away from places where there is really good fishing and hunting.

MRS. J. P. PRESCOTT.

Striped Bass in the Sound.

LAST Friday Mr. P. E. Sanford, of the Winchester Repeating Arms Company, received at the store, at 312 Broadway, New York, a striped bass weighing 22lbs. and measuring 36in. in length.

This fish was caught by his son, Mr. A. D. Sanford, trolling with white worms off Saugatuck, Conn. Mr. A. S. Wheeler, who was in the same boat with Mr. Sanford, caught another bass weighing 24½lbs.; and the total catch for the boat weighed 58lbs. J. B. B.

The Kennel.

FIXTURES.

BENCH SHOWS.

Dec. 1 to 4.—City of the Straits Kennel Club's local show, Detriot, Mich. R. H. Roberts, Sec'y.

The Dog and the Picture Again.

ALLOW me to succinctly recapitulate the contents of the letter from the Rev. Peter Claude Creveling, upon which I based the claim that a dog can cognize a portrait—the publication of which letter, with comments from me, in FOREST AND STREAM some months ago, brought on, the reader will remember, quite a controversy, which was very pleasant to me.

Mr. Creveling took Tiger (Mr. Creveling's dog) into Mrs. Creveling's studio, where she had placed upon an easel a just finished crayon portrait of her husband. The dog cognized it at once, and attempted to lick its face, in which attempt he failed, because the portrait was covered with glass. The failure surprised him. He tried again. Again he failed. Then he lay down upon the floor, placed his head between his paws, and whined piteously. This was his first experience with a portrait, and he evidently mistook it for his master. But the mistake was corrected by his master's speaking. Turning to his master, he recognized him, and though he (Tiger) weighs 105lbs., he leaped upon his master's lap and almost smothered him with kisses.

It is evident that Tiger cognized the portrait; it is also evident that he recognized his master; and it is just as evident that he cognized the difference between the portrait of his master and that master himself. But I did not take up my pen to call attention to these facts of cognition and recognition; I did so to say that, on the 30th of September and the 1st of this current month, I was with Mr. Creveling at the Diocesan Convention. As soon as I saw him I asked him about Tiger. His reply was: "My wife says that I am in great danger of becoming as much of a crank about dogs as Adams!" This was said more to the surrounding clergy than to me, of course. They laughed, I joined in the laugh. I am willing to be the butt of any sort of a joke, the tendency of which is to give me a chance to teach biophilism. The laugh over, I recapitulated Mr. Creveling's letter to me, as I have done in this paper, and asked him if that letter was not simply a statement of facts. He replied that it was, and then went on to say that Tiger has since cognized portraits over and over again. He instanced as objects of Tiger's cognition the portraits of a couple of little children—whom he sees frequently—the children of the janitor of the church of which Mr. Creveling is rector. Why Mrs. Creveling crayoned these children, unless it is because she is fond of them, as Tiger is, I do not know; but they are good subjects, and she succeeded in making speaking portraits of them. When Tiger saw these portraits he wagged his tail, snapped his chops, looked at them lovingly, then at Mr. Creveling, then back at them, and did so over and over—giving every evidence that he knew them. There was glass over these portraits, as glass was over the portrait of Mr. Creveling. But Tiger had learned from experience. He did not lick this glass. So again Tiger has cognized not only one portrait, but two portraits. And that is not all.

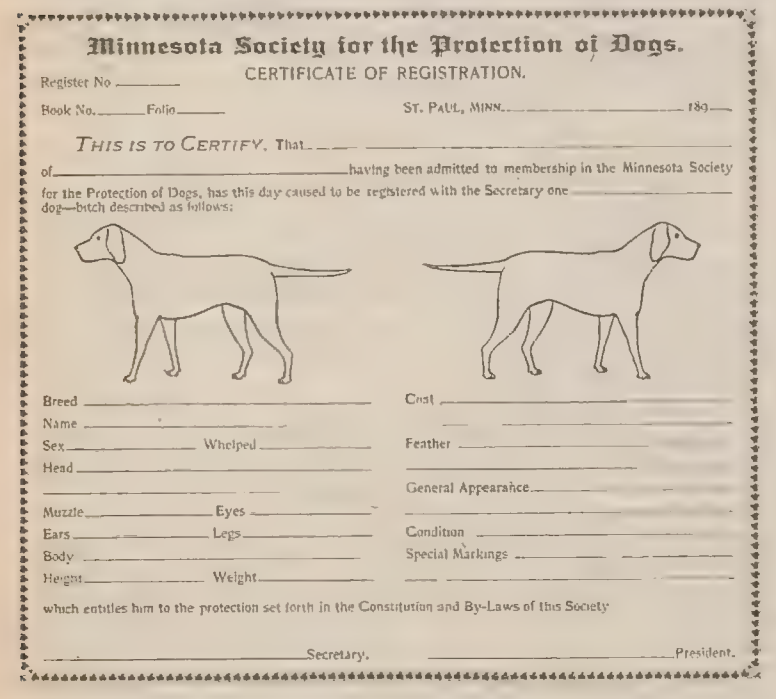
It will be remembered that up to this I have never claimed that a dog can recognize a portrait, though I believe that I have said that I thought that he could. Now I know that he can, for I asked Mr. Creveling whether when Tiger saw the portraits of the children again he knew them, and he answered, "Yes, time and again."

So Tiger has not only cognized a portrait; he has recognized two portraits—and has done so "time and again." A wonderful dog, that Tiger! It is no wonder that when Mr. Creveling leaves home with his family he does not leave Tiger behind. The death of such a dog would be a calamity, not only to his master, and to those who know him, but to other dogs and to humanity; for he has illustrated many things held to be true by biophilism.

I do not say that other dogs have the power of cognizing and recognizing a portrait, I only say that Tiger has that power; and if one dog has it other dogs may have it. Which is equal to saying that it is essential to the dog mind. Which is saying much for the dog as to both time and eternity. CHARLES JOSIAH ADAMS.

ROSSVILLE, Staten Island.

The FOREST AND STREAM is put to press each week on Tuesday Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.



A SOCIETY FOR DOG PROTECTION.

Editor Forest and Stream:

In giving you a brief review of the Minnesota Society for the Protection of Dogs, its organization and its workings, it will open up a new field for the attention of sportsmen and owners of hunting dogs throughout the length and breadth of this great country, and must meet the approval of dog owners everywhere.

In a game country, several months before the open season every owner is conditioning his dog for the hunt, and every fellow who doesn't own a dog is figuring how he can either borrow or steal the canine property of the other fellow.

The formation of our own society, the pioneer of such a protective movement, was brought about in this way: Toward the close of last year's open season five gentlemen who had been enjoying the sport met by chance at the railway station of a little Minnesota town. In the party was that genial sportsman and correspondent, Mark Biff. The comparison of shooting notes was the foundation of a catchy article in a St. Paul daily by the newspaper man, and in it the good qualities of their dogs were extolled. Now, this article must have engaged the attention of an organized gang of St. Paul dog thieves, for within two weeks from that date each of these gentlemen lost his dog. Then the need of a dog protective association was agitated, and a representative crowd of Twin Cities dog owners met at the Windsor Hotel on Dec. 2 and effected what is now an organization. Your correspondent, from his connection with the Game and Fish Protective Association, was asked to take the secretaryship of the new movemnt. Our membership has grown to more than 300, and we are protecting nearly 500 valuable dogs in the North Star State at this writing. We have had nineteen losses and seventeen recoveries, but not one chance for a prosecution, as our methods of advertising and procedure make it almost impossible for any dog thief to retain possession or to ship such dog from the

Minnesota Society for the Protection of Dogs.

CERTIFICATE OF REGISTRATION.

Register No. _____

Book No. _____ Folio _____ ST. PAUL, MINN. _____ 189—

THIS IS TO CERTIFY, That _____

of _____ having been admitted to membership in the Minnesota Society for the Protection of Dogs, has this day caused to be registered with the Secretary one _____ dog—bitch described as follows:

Breed _____ Coat _____

Name _____

Sex _____ Whelped _____ Feather _____

Head _____

General Appearance _____

Muzzle _____ Eyes _____

Ears _____ Legs _____ Condition _____

Body _____ Special Markings _____

Height _____ Weight _____

which entitles him to the protection set forth in the Constitution and By-Laws of this Society

_____ Secretary. _____ President.

State. Consequently the dogs have been returned to us within a day or so after loss, and we have paid but one $5 reward for such service. The society is decidedly a popular one. Our forms for application and registration, together with metal tag, are far ahead of those in use by any city in the country in its methods of dog licensing. If you have the space for publishing one of our inclosed forms it will be more self-explanatory than a long worded description.

The results of our work are these: On inquiry of our daily papers we find that the number of lost dog "ads." has fallen off 50 per cent. since we entered the field, for since dog thieves can neither dispose of nor keep their property, there is no longer any incentive for stealing them. We put no premium on dog stealing by offering rewards for the return and no questions asked, but our rewards are payable for information and conviction of person detaining or stealing the dog, and in some cases reasonable expenses for their care and safe return.

I have mailed our forms and caused the organization of like societies at Nashville, Tenn., and Winnipeg, Man. The one at Winnipeg is in an exceptionally flourishing condition, having for its patron General Superintendent Whyte, of the Canadian Pacific Railway; and as secretary the successful barrister and sportsman, R. Masson Smith, of Winnipeg.

The objective point for which we are working is to see every State with its protective society, and from these to form a national association; thus making it impossible for anyone to steal a dog in one State and dispose of it in any other. It must be considered that thousands of dollars are invested in hunting dogs annually, and such protective work is the demand of the hour from every owner of a first-class dog.

I regret that my own time is so fully occupied by office work that I will be obliged to relinquish the secretaryship at our annual meeting. While I have all the heartfelt interest in my nature for things that appeal to a sportsman's fancy, and at the same time will conserve our game and fish supply from an economical standpoint as a good product for a general public, I am not in a position to give up my private interests in other lines to carry out all protective measures I would see put in practice,

WM. L. TUCKER, Sec'y.

Protective Societies.

THE letter of Wm. L. Tucker, secretary of the Society for the Protection of Dogs, St. Paul, Minn., published elsewhere in our columns, is deserving of the most earnest consideration of all dog owners and fanciers. The moral effect of that society on the dog thieving classes, and the material success in the recovery of lost, strayed or stolen dogs which is shown by the secretary's report, establishes the fact that the society has the ability to carry out its purposes.

Every large city is afflicted with numbers of dog thieves, some of which are well organized, with branch organizations or business connections with similar organizations in other cities. By such business arrangements, a valuable dog stolen in one city may at once be shipped to some other large city, to be disposed of by confederates, and stolen dogs may thence be sent back in exchange, thus affording a much safer system in every way for the sale of the dog and freedom from detection than if the dog were disposed of in the city in which he was stolen. In fact, without any protective organization there is not one chance in a thousand for an owner to recover a stolen dog without the offer of a reward large enough to satisfy the cupidity of the thieves.

It is possible to form city and State organizations which would reciprocally work for each other's benefit, and such organizations would make profitable dog stealing almost impossible.

The constitution of the Minnesota Society sets forth its mission as follows: "The purpose and business of this Society shall be to protect its members in the possession and ownership of valuable dogs; to secure the return of the same when astray or stolen, and to prosecute and by all legitimate means assist in the punishment of dog thieves." Again: "The membership fee, which shall include the payment upon initiation, shall be $1 per year. A further fee of 25 cents per dog shall be paid, for the registration thereof, to the Secretary."

For exact information in case a dog be stolen or lost, a blank form, with two outline drawings of dogs, on which can be filled in all the markings of the dog registered, is furnished members, and this, kept on file in the secretary's office, affords all needed information for describing the lost dog.

In case a member's dog is lost or stolen, the Society immediately sets all its machinery at work to recover him. That the organization is a success in its practical workings is shown by its records.

A similar organization which existed some years ago and which probably still exists in the West and South, but which was organized to prevent horse and cattle thieving, had a membership over a wide territory and did much to make horse and cattle thieving a dangerous and unremunerative occupation.

EASTERN F. T. C.'S ENTRIES.

All-Age Stake.

GREENFIELD HILL, Conn.—*Editor Forest and Stream:* Thirty entries: twenty setters, ten pointers.

MOLLIE B.—Dr. J. Spencer Brown's b., w. and t. setter bitch (Roderigo—Lilly B.).

VON GULL—Ashford & Odum's liv. and w. pointer dog (Kent Elym—Fannie V. Croxteth).

GLEAM'S RUTH—Manchester Kennels' b., w. and t. setter bitch (Count Gladstone—Gleam's Maid).

LEO NOBLE—A. L. Shonfield's b., w. and t. setters dog (King Leo—Minnie T.).

SAM T.—George Croxteth's b. and w. setter dog (Luke Roy—Bettie B.).

TORY JESSAMINE—F. R. Hitchcock's liv. and w. pointer bitch (Duke of Hessen—Westminster Blonde).

TORY LILY—F. R. Hitchcock's liv. and w. pointer bitch (Duke of Hessen—Westminster Blonde).

FAIRY KENT—Paul H. Gotzin's l. and w. pointer bitch (Lad of Kent—Baski).

RANIE II.—Irving Hoagland's b., w. and t. setter bitch (Gladstone's Boy—Bonnie Vista).

CINCINNATUS PRIDE—E. A. Burdett's b., w. and t. setter dog (Cincinnatus—Albert's Nellie).

NABOB—Charlottesville Kennels' b., w. and t. pointer dog (Rip Rap—Dolly D.).

INDIA—Charlottesville Kennels' l. and w. pointer bitch (Rip Rap—Dolly D.).

GEORGE CROXTETH—W. D. Henry's liv. and w. pointer bitch.

BLACK RODS—S. D. Ripley's b. and w. setter dog (Ray of Hope—Lulie).

LOU—Dr. G. G. Davis's red Irish setter bitch (Finglas—Currer Belle).

MAUD NOBLE—N. Wallace's b., w. and t. setter bitch (Rowdy Rod—Pearl Noble).

JOE GLADSTONE—Piedmont Kennels' l. and w. setter dog (Gladstone's Boy—Buena Vista).

ODD SIDES—W. A. Wimsatt's l. and w. pointer dog (Lap of Pearl—Graceful II.).

LADY GRACE II.—W. A. Wimsatt's b., w. and t. pointer bitch (Roger Williams—Graceful II.).

WANG—Geo. S. Saylor's l. and w. pointer dog (Roger Williams—Graceful II.).

TONEY'S GALE—Fox & Blyth's b., w. and t. setter dog (Antonio—Nellie G.).

FORZANDO—Fox & Blyth's b., w. and t. setter dog (Gath's Mark—Countess Rush).

HAROLD SKIMPOLE—W. H. Beazell's b., w. and t. setter dog (Whyte B.—Nellie Bevin).

HARWICK—H. R. Edwards's b., w. and t. setter dog (Topsy Rod—Opal).

HARVARD—H. R. Edwards's w. and t. setter dog (Dan Burgess—Opal).

MARIE'S SPORT—H. B. Ledbetter's b., w. and t. setter dog (Gleam's Sport—Marie Sport).

DOMINO—D. E. Rose's (Agt.) b., w. and t. setter dog (Antonio—Ruby's Girl).

GREENWAY—D. E. Rose's (Agt.) b., w. and t. setter dog (Antonio—Ruby's Girl).

ARAPAHOE—P. Lorillard, Jr.'s, b., w. and t. setter dog (Eugene T.—Maiden Mine).

RUSH MARK—Piedmont Kennels' b., w. and t. setter dog (Gath's Mark—Countess Rush).

Eastern Subscription Stake.

Open to all pointers and setters. Fifty per cent. of subscription, payable Oct. 1, entitles the owner to start any dog he pleases, whether his property or not. It is transferable to any person not objectionable to the club. Following is a list of the subscribers, eight entries: Messrs. Ashford & Odom one entry, Del Monte Kennels two entries, Edward A. Burdett one entry, Charlottesville Kennels one entry, H. R. Edwards one entry, H. B. Ledbetter one entry, N. T. Harris one entry.

S. C. BRADLEY, Sec'y-Treas.

Continental F. T. Club.

INDIANAPOLIS, Ind., Oct. 17.—*Editor Forest and Stream:* Owing to the fact that the Champion Field Trials Association ran its trials last year at West Point, Miss., following the trials of the U. S. Club, and not wishing to interfere with their date, the Continental Field Trials Club has decided to start its trials at Tupelo, Miss., Monday, Jan. 11, 1897.

P. T. MADISON, Sec'y-Treas.

UNION F. T. C. ENTRIES.

INDIANAPOLIS, Ind., Oct. 17.—*Editor Forest and Stream:* Herewith find list of entries to the Derby and All-Age Stake of the Union Field Trials Club's annual trials. The trials will begin at Carlisle, Ind., Monday, Oct. 26. Mr. J. H. Johnson writes me that birds are very plentiful, therefore I anticipate a very pleasant meeting.

All the Derby entries were born in 1895.

Derby Entries.

SARAGOSSA BELLE—Philip M. Essig's b., w. and t. setter bitch (Gleam's Pink—Maud E.).

TARTAR—S. L. James's b., w. and t. setter dog (Count Gladstone IV.—Rod's Sylph).

POTOMAC—Fox & Blythe's b., w. and t. setter dog (Antonio—Countess Rush).

SARSFIELD—J. P. Greene's b., w. and t. setter dog (Rodfield—Opal).

DAVE EARL—Theo. Goodman's b., w. and t. setter dog (Count Gladstone IV.—Dan's Lady).

ALBERT LANG—Theo. Goodman's b., w. and t. setter dog (Count Gladstone IV.—Dan's Lady).

SPOT—Albert Lieber's b. and w. setter dog (——— ———).

SAM HILL—Dr. Jas. McDowell's b., w. and t. setter dog (Rodfield—Indiana Belle).

EASTER LILLIE—Charles Fox's b., w. and t. setter dog (Dan R.—Bonnie Doo).

FLORENCE GLADSTONE II.—James D. Poston & Co.'s b., w. and t. setter bitch (Antonio—Florence Gladstone).

RIPPLE—Hampton S. Smith's liv. and w. pointer bitch (Rip Rap—Pearl's Dot).

BILLY T.—Frank Richards's (agt.) b., w. and t. setter dog (Revenue—Daisy Bondhu).

KENO N.—John T. Mayfield's (agt.) b., w. and t. setter dog (Count Lucifer—Dashing Mamie).

GLEAM'S ROY—John T. Mayfield's b., w. and t. setter dog (Gleam's Sport—Marie Avent).

RODFIELD'S BOY—John T. Mayfield's b., w. and t. setter dog (Rodfield—Sue Gladstone).

KING LEE—L. W. Blankenbaker's liv. and w. pointer dog (Kent's Joe—Lad's Lady).

NEVA GLADSTONE—Richard Merrill's b., w. and t. setter bitch (Paul Gladstone—Lady Lucy).

NORA GLADSTONE—Richard Merrill's b., w. and t. setter bitch (Paul Gladstone—Lady Lucy).

RUDGE GLADSTONE—Richard Merrill's b., w. and t. setter bitch (Paul Gladstone—Lady Lucy).

ROD GLADSTONE—Wm. Pollard's b., w. and t. setter dog (Rodfield—Sue Gladstone).

JOSIE FREEMAN—John A. Gude's b., w. and t. setter bitch (Antonio—Nellie Hope).

VIM GLADSTONE—Fishback & Baughm's b., w. and t. setter dog (Gladstone's Boy—Gath's Belle).

ÆOLIAN REX II.—C. P. Mingsh's b. and w. English setter dog (Antonio—Columbia).

COLUMBIA—C. F. Hartinetz's c. and w. English setter bitch (Gath's Mark—Queen Blade).

TONY'S GALE—J. H. Johnson's (agt.) b., w. and t. English setter dog (Antonio—Nellie G.).

FORZANDO—J. H. Johnson's (agt.) b., w. and t. English setter dog (Gath's Mark—Countess Rush).

MARK OF IGHTFIELD—Joseph Bicker's b., w. and t. English setter dog (Ightfield Rhivillis—Queen Regent).

LADY PEY II.—Richard Merrill's liv. and w. pointer bitch (Rip Rap—Lady Pey).

DAISY RIP RAP—Richard Merrill's b. and w. pointer bitch (Rip Rap—Lady Pey).

STRIDEMORE—Richard Merrill's liv. and w. pointer dog (Strideaway—Hops II.).

NOBLE—Richard Merrill's liv. and w. pointer dog (Spotted Boy— ——).

CINCINNATUS PRIDE—E. A. Burdett's b., w. and t. setter dog (Cincinnatus—Albert's Nellie).

ANNE OF ABBOTSFORD—E. A. Burdett's b., w. and t. setter bitch (Gladstone's Boy—Bohemian Girl).

CRACKER JACK—J. L. Adams's liv. pointer dog (Lad of Rush—Cyclops).

CYNOSURE—Norvin T. Harris's b., w. and t. setter bitch (Roderigo—Norah II.).

BONNIE BELL II.—Norvin T. Harris's b. and w. setter bitch (Thiers—Lilly B.).

PRINCE—Norvin T. Harris's b. and w. setter dog (——— ———).

ANTO GLADSTONE—Jas. D. Poston & Co.'s b., w. and t. setter dog (Antonio—Florence Gladstone).

P. T. MADISON, Sec'y-Treas.

The Philadelphia Kennel Club.

WE have received the following announcement of the policy and stakes, etc., of the club, as follows:

The Philadelphia Kennel Club is the only organization in the kennel world that combines in its membership those interested in field trials as well as bench shows. The Philadelphia Kennel Club has always been run on the broad-gauge policy, and counts among its members those who have been for years prominent in field trial matters, as well as those who patronize the bench shows.

It is an open secret that bench shows of this club have always been an expensive luxury, but there is that—shall we say—*esprit de corps* among the members that secures from the field trial men financial support for the bench shows. As a fact, many of the members whose interests lie only in the field trials annually go down into their clothes to help pay the deficit in the bench shows.

This organization of sportsmen are welded together in the strong ties of good-fellowship and a fondness for man's best friend. The meeting at the field trials of the Philadelphia Kennel Club have a charm all their own. The members as a rule have their special car, and all start as near as possible in a body, and have their quarters and arrangements all perfected in advance. With few exceptions the members handle their own dogs and the trials are run, as we have contended trials should be run, as a friendly, sportsmanlike competition between good dogs. The judges are secured usually from their own members, and up to quite recently the trials have been only open to members of the club.

A meeting was held on Tuesday, Oct. 13, when the date for holding the next trials was fixed, which will commence with the running of the Members' Stake on Friday, Nov. 20. This stake is open to all members of the Eastern Field Trials Club, and the entries are closed the night before the running. Professional handlers are barred.

The prize will be the famous *Item* bowl, which has been

contended for many years, and which has as often been filled by the owner of the victorious dog at the annual meeting the following January at the Aldine Hotel.

The Derby and All-Aged Stake is open to members of the club only. The club has secured 11,000 acres of the very best shooting ground at Thomasville, N. C., and has, it is conceded, one of the best stocked shooting preserves in America.

Blanks and other information relative to the running of the stake mentioned can be had by addressing Dr. Alexander Glass, Secretary, No. 2125 Sansom street, Philadelphia.

TROOPING COONS.

CALIFORNIA.—*Editor Forest and Stream:* I was raised on the banks of the Columbia River, and for youthful companions I had none but the young Siwashes of the Cathlamets, and the Wahkiakums, and for good times none had better. Among the Cathlamets were two mighty coon hunters, Gull and Tick by name, and from them I learned the ways of the coon, and I tell you he has more than one way. If he is hard pushed there is no telling where or what his cunning will call into play. You no doubt have been a party to a fox hunt, and know from experience that the sly old fox will double his trail or leap a brook three or four times to baffle the hounds. A coon can stick his nose in his fur and laugh at the best tricks of the fox.

A fox is nothing if not a sneak at his best, while a coon is bold and fearless, and all his movements, whether by day or night, are characteristic of that of every animal in the green forest.

I must now take you away with me on one of our coon hunts along the banks of the Columbia.

Most coon hunts are conducted by moonlight, with rifle, aye, and hounds, but our way was just the reverse of all others on the river. We would hunt down our coons by broad daylight. We did not break our necks or bark our shins tumbling over fallen timber before a fat pine torch, or work like beavers cutting down a treed coon; but we took to our canoes and paddled noiselessly up the river about four or five miles, and just at break of day two of us would land. The third man, as agreed upon beforehand, would paddle the canoe down the river again about one or two miles, then land and work on up until we met. The coons had been running all night, and to find a "sign" is as easy as falling off a log, and there the trail commences; but to keep that trail is what calls in all the faculties, and the knowledge and habits of the animal in pursuit of, not saying anything about the lay of the land, for thickets of briar and bramble are met with on every river bottom. "Direction" is the main trail to success on this coon hunt. The parent coons together with the young coons have been out on a forage all night; they have left no stone nor leaf unturned in their efforts to satisfy the cravings of an empty stomach. They have been up and down the margin of the river catching minnows in the shallow eddies. They have been by the silent pool dispatching the innocent frog. They have rambled far and wide, and in their playful moods have chased each other among the tree tops until the gleam of breaking day told them by instinct to gather for their home. In a troop they travel on in their well-worn path to their home in a hollow tree, or among the roots of a prostrate pine.

To follow the "sign" of coons takes good judgment, especially so at different times of the seasons. In the fall and winter they are trooping; it is so called among trappers, because you will find the male and female together, and often one will come across a troop of coons in broad daylight. The females will lead, with the males coming on behind, fighting, snarling and tumbling for supremacy nearest the females; if one has got his eyes and ears open, and is in a position to the windward of their approach, he will have some fun by blazing away on the leading coon. As soon as the shot is fired every male coon will take to a tree in the near vicinity and every female coon will take the back track until their fright be over, then double and take for home. Now, if one be a good rifle shot, he can get the last one of those coons that treed. I have shot as many as nine coons out of one troop in that peculiar manner. Of course, it takes a good man in the woods to trail up a troop of coons, and I believe that there are not ten men in 1,000 that can do it, for the coons have a cute nose, a fine ear and a pair of keen eyes, and will surely detect the babe in the woods.

Gull, who was the chief of the Cathlamets, and old Tick, chief of the Wahkiakums, and I, have bagged as many as twenty-five coons in one hunt.

I believe, to make a success of trailing a troop of coons, one must know every inch of the country he is hunting in, and have a natural instinct for trailing just as a hound has, otherwise he will spy never more than two or three coons at one time. I have tried trooping coons away from large river banks, but with indifferent success. The Columbia River, I believe, is the only stream, because of its sparse settlements along its banks, where trooping coons can be followed with any success by a good trailer.

The coons come from far and wide to the banks of the river to gather the food, which a river of so large a volume can only give.

This mode of hunting coons may seem strange to you or your readers; but it is nevertheless true, as any one who has studied the habits of the coon will attest. I have followed hunting and trapping ever since I was a boy, and I can give you facts that seem yet stranger than this. The best part of my hunting days are over, game is no more as plentiful as it was; but memory lends a charm, and we must fight our battles over again.

HANK PETERSON.

A Stray Shinplaster

Comes to us once in a while for a copy of "Game Laws in Brief;" but shinplasters nowadays are scarcer than Moose in New York; and 25 cents in postage stamps will do just as well.

POINTS AND FLUSHES.

At a meeting of the Metropolitan Kennel Club, held Oct. 17 in New York, the following resolution was passed: "The executive committee considered it to the interest of the club to hold a bench show in Brooklyn Thanksgiving week, and would urgently request the presence of all members at Rockwell's, 140 Lexington avenue, New York city, on Wednesday, the 21st inst., at 4 P. M."

The Armstrong *Republican*, of Kittanning, Pa., mentions an extraordinary large litter as follows: "A female St. Bernard owned by A. C. Bailey, the well-known merchant of Ford City, recently gave birth to nineteen pups. This is the largest number ever known to have been born at one time, and is exciting considerable curiosity among dog fanciers."

Mr. P. T. Madison, secretary-treasurer of the Continental F. T. Club, is deserving of the thanks of all field trial patrons for his forethought and energy in arranging a scale of prices favoring visitors at Tupelo. With hotel rates at $1.50 per day, double teams with driver at $2 50, and saddle horses at $1 per day, the expense account of the trial will be materially reduced to all concerned. What Mr. Madison has done other directors can do if they choose to try. FOREST AND STREAM years ago called attention to the unjust discrimination against sportsmen at field trials, where it seemed that the more that attended and the longer they remained, the higher the rate charged. Hotels having weekly rates would abolish such rates so far as field trial patrons in the field trial season were concerned, though a patron might be seated beside a local patron who was paying but little more for a week's board than the field trial man paid for a day's.

Mr. Joseph H. Hunter, the well-known sportsman, whose skill at the traps, in the field or with fishing rod, are well known, writes us the unpleasant information that he will not give field trials much attention in future. Some scoundrelly fellow poisoned his favorite shooting dog recently. Black Wonder was famous in field trial records and was of extraordinary high merit in field shooting. The Messrs. Hunter brought to the competition many times dogs of the highest merit, the best perhaps being Daisy Hunter, and she was among the best ever brought to a field trial. Sad to relate, she disappeared in a neighborhood with which she was familiar and nothing was heard of her afterward. It is no wonder that such hard luck should be discouraging.

The Boston Terrier Club Book, Vol. II., 1896, is replete with information concerning club matters and matters concerning the Boston terrier. It contains a list of officers and members, and constitution, standard, trophies, produce stakes, prize winners, registrations, etc. Secretary, F. G. Davis, Boston.

The prices at Mr. Lorillard's sale ruled low. Antevolo sold for $20; Rancocas Belle, $210. Others from $35 to $5 and $2, mostly the smaller prices.

We learn that there is much interest in the superintendency of the prospective Brooklyn show.

Wheeling.

Communications for this department are requested. Anything on the bicycle in its relation to the sportsman is particularly desirable.

"BICYCLE REPAIRING."

"BICYCLE REPAIRING" is a book of 160 pages of solid mechanical facts, from the press of the *Iron Age*, New York. All the various bicycle ailments are touched upon and directions given for setting them right. Special chapters are devoted to the most important parts of the bicycle, such as the handle bar, tire, wheel, valve, fork and frame; and enameling, brazing and nickel plating are treated of from the standpoint of the repair man. The chapter on "Miscellaneous Hints," however, contains perhaps the greatest amount of useful information in compact form.

The methods of repair described are, as a rule, the simplest possible compatible with good workmanship, and a considerable amount of space is given to simple home-made contrivances designed to perform the work of more expensive machines. For instance, a case-hardening furnace, suitable for use where small objects only are to be treated, is constructed from an old fruit can and a tin tobacco box in combination with a Bunsen burner, while a brazing furnace is made from half a dozen joints of ordinary gas pipe.

The book is designed for the use of professional repair men, but there is much in it that will prove of interest to the wheelman who is of a mechanical turn. Even if the wheelman attempts no repairs himself, it is just as well for him to have a general idea of the various processes employed, as the knowledge will be of service when his wheel is placed in the hands of a professional. The unprecedented growth of the bicycle trade has resulted in many inferior mechanics and botchers taking up the business of repairing, and it is easily possible for these men to ruin a good wheel while attempting a simple repair. If the owner knows exactly what is wanted himself he will be better able to judge of the capacity of the man to whom he intrusts his wheel. A little knowledge of its mechanical construction is never wasted. As a case in point, a wheelman took his bicycle to a repair shop to have an eight-tooth rear sprocket replaced by a seven-tooth one. He waited for his wheel, and as the job seemed to take an unnecessarily long time, walked back into the work shop to find out what the trouble was. He found the repairer armed with a large wrench wrestling with the check piece, which was screwed into the axle on the outside of the sprocket. The man mopped his brow, and asserted it as his belief that check nut and sprocket were brazed on the axle.

The owner recollected that he had heard that in that particular make of wheel the check nut was a left-hand screw, and here was a mechanic, professedly acquainted with the bicycle in question, who had spent twenty minutes trying to ruin an axle for him. He told the man that he had better leave the sprocket on, and took it to a repairer that a friend had recommended a few days before. This man had no trouble in completing the job satisfactorily, but he had to get a new check nut, and a minute more of the first man's work would have made a new axle necessary.

In the introduction to "Bicycle Repairing" the author remarks:

"The wonder is not that the bicycle occasionally breaks down, but that it lasts as well as it does. When we consider the relative weight of the wheel and its rider, and think of its apparently frail construction, and then remember the severe strains to which it is subjected in service, we are compelled to admire its design, the strength of its parts and the perfection of its workmanship. When a machine of this character, so delicate in its component parts and so finely adjusted, is in need of repair, it should evidently be taken to one who will understand the difficulty and who knows how to apply the proper remedy.

"This seeming delicacy of the bicycle has been of the utmost importance to the bicycle trade as a whole. To it, and to it alone, can be ascribed the wonderful scarcity of really poor wheels. The bicycle is a chain, and every part constitutes a link which must of necessity bear its portion of the strain. To weaken one of these links or parts by the introduction of inferior material means the speedy destruction of the wheel. To keep up the strength by using a greater quantity of cheap metal would meet with no demand, because the rider of to-day will not mount a heavy wheel, and the bicycle itself is the best safeguard against imposture."

INGENUITY OF TWO FARMER BOYS.

LITTLE ROCK, Ark., Oct. 8.—One day last June, during the time the National Bicycle meeting was in progress here, L. W. Wheeler, a farmer boy nineteen years of age, living in Grant county, about thirty-five miles from this place, rode into the city on a wheel constructed of wood, made by himself with such tools as are generally found on a farm in Arkansas. The advent of this juvenile wheel manufacturer in the city at a time when the cyclists from all over the State were gathered there naturally created quite an excitement among them, and he at once became the center of attraction. One of our local dealers saw a good thing in this wheel as an advertising medium, and offered to exchange a modern high grade safety for the farmer boy's crude and cumbersome machine. And it is needless to say that his offer was promptly accepted.

After several days spent in the city he returned to his home on the farm, the proud possessor of a modern wheel, and the envy of all the boys in the neighborhood. His fame and success had preceded him, and he was pointed out with pardonable pride by all the people in his county. His wheel was constructed on the principle of the machine of to-day. The wood used was native timber, and no little ingenuity was displayed in the construction of the wheels, which were wrapped with thin strips of split hickory, and of course were puncture proof.

To-day saw the advent in our city of the second one of the wooden home-constructed bicycles, the maker and rider of which was J. J. Mooney, also of Grant county, a lad seventeen years old. This boy, unlike his predecessor, did not ride his wheel from home to the city, but brought it the thirty-three miles on his father's wagon with a load of cotton, after which mounting it he proceeded to view the city. He too attracted considerable attention, not only by his wheel, but also by his attire. When approached on the subject of disposing of his machine, he was very modest, and thought that an exchange of a $100 wheel would be a fair trade—thinking doubtless that if his neighbor found no trouble in disposing of his on such terms, he should be equally as successful. In this he was disappointed, however; for the bicycle season is now about over, and the novelty of such a machine having worn off, there was little in it as an advertisement. He lives within three miles of the inventor of the first wooden cycle, and was doubtless spurred on by the success of his neighbor, imagining that he would encounter no difficulty in effecting a similar exchange.

This machine was constructed on the lines of the old ordinary, and though considerable ingenuity was displayed by its youthful maker, and it was also better finished, it was hardly up to the high standard of skill shown in the construction of the other wooden wheel. To the first undoubtedly belongs the credit of originating this style of wheels, while the other was only an imitator. Both were unsophisticated country boys, who lived where few bicycles are to be seen, and the tools used to construct their machines were very crude. PAUL R. LITZKE.

Mother Shipton's Prophecies.

PORT HAMMOND, B. C.—*Editor Forest and Stream:* Under the heading devoted to Wheeling there is an article in your paper of Aug. 15, "The School for all Ages." The writer states that Mother Shipton may have preseen the locomotive engine and some of the uses of electricity, but the bicycle was beyond her ken. I send you a clipping from a local paper in which I claim the riding astride refers to the bicycle.

The quotation is as follows:

"In those wonderful far-off days
Women shall get a strange, odd craze,
To dress like men, and breeches wear,
And cut off their beautiful locks of hair,
And ride astride with brazen brow,
As witches do on broomsticks now."

R. C. BROOKE.

NOTES.

Evidences of the adaptability of the bicycle to new uses continue to multiply. The bank robber who is up to date dashes up to his bank on a wheel, and when he has looted it departs in the same way. Scorchers are so common almost everywhere that the robber "hitting it up" to escape his pursuers does not attract a quarter the attention that he would if mounted on a foam-flecked horse. Then, too, the bicycle leaves a misleading trail, and from this alone it is impossible to say which way the rider went. Jesse James would turn in his grave to see the way the thing is done nowadays, but the modern robber knows that the use of the bicycle adds largely to his chances of escape.

In the Adirondacks the bicycle is responsible for such paragraphs as the following:

"Charles H. Palmer, foreman in the office of the *Post and Gazette*, is out on his annual deer hunting vacation. He left town on his bicycle yesterday, bound for North Hudson, his face beaming with happy anticipation. We await the realization, hoping and trusting that his fondest expectations will come to pass."

In Maine, according to the Bradley, Me., correspondent of the New York *Sun*, a thrifty skunk trapper uses the bicycle to hunt skunks. He formerly hunted them at night with a dog. Now he lights a lantern and mounting his bicycle rides through the mown grass fields, and whenever he sees a skunk dismounts and kills it with a club. On his first bicycle hunt he is reported to have killed eighteen. He likes the new method, and says that for results a good bicycle is away ahead of any dog he ever saw.

Circumstances alter cases. An old horseshoe with nails in it is not considered a lucky find by wheelmen.

In the matter of good roads New Jersey is one of the foremost States in the Union. Hundreds of miles of fine macadam roads have been constructed within the last ten years, and the results of this progressive movement now serve as an object lesson for less enlightened communities. The story of one of the small towns in a farming and trucking locality will serve as an example. Originally the roads were about the average of country roads, and at certain seasons of the year were practically impassable. As a rule the maximum load for four horses was fifty-five bushel baskets, or about two and one-half tons of produce, on a wagon weighing 1,900lbs. Two men accompanied this to market and it took a day to make the round trip. Under these conditions farms were a drug on the market, and there were no buyers for real estate.

A few years ago, however, the community woke up. The town issued $4,000 worth of bonds and applied the proceeds to building good roads. As a result the neighborhood experienced a new prosperity. Two horses are now able to do more work than four on the old roads and with greater ease. Ninety to 125 bushel baskets are not considered too large a load for two horses, and it is a common thing now for one man with two horses to take four and a half tons of produce to market on a wagon weighing 2,300lbs., or about double the old four-horse load, and instead of one trip a day he makes four.

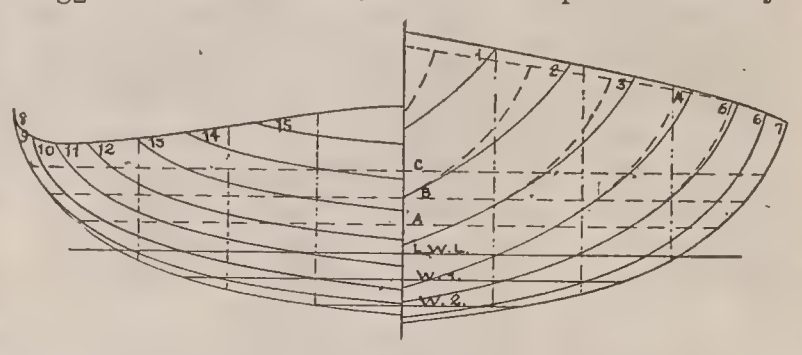
According to these figures one horse on the improved stone roads does the work of sixteen on the old mud roads. A remarkable commentary on the value of road improvement.

The tabulated report recently issued by the Illinois State Board of Equalization, compiled from the returns of the assessors of 102 counties, shows a heavy decrease in the valuation of horses, due to the influence of the bicycle and electricity on the market. In 1895 the returns showed the number of horses in Illinois listed by the local assessors to be 1,169,360, valued at $15,014,342, or on an average $12.84 per head.

The returns for 1896 show the number to be but 1,112,094, valued at $12,599,782, which reduces the average valuation per head to $11.32. From these figures it will be seen that in a single year the number of horses in Illinois decreased 57,266, while the loss in valuation was $2,414,560. With fewer horses in the State, each horse is worth $1.51 less than it was last year.

Yachting.

THE movement now under way about New York for the improvement of racing rules is of special importance as indicating a feeling on the part of the clubs and of individual yachtsmen that some change is imperatively necessary, and also an evident disposition among all concerned to work in harmony toward the desired end. At the present time three important yachting bodies are engaged in the same task—the Yacht Racing Union, the New York Y. C. and the Larchmont Y. C. While the Seawanhaka C. Y. C. has taken no individual action, it is closely identified with the Yacht Racing Union, and will in all probability accept the amendments adopted by it.



The movement as a whole is not only being carried out with that unity and harmonious action which is in every way desirable, though often lacking in the past, but it has been inaugurated at the proper time, immediately at the end of the racing season, and not in the spring, as has been too often the case, at so late a date as to prevent any action for the next season.

The changes proposed in the New York Y. C. rules, which we print this week, show the general details of the movement, most of which will be recognized as desirable. The classification will be uniform in all of the clubs in the Yacht Racing Union, including the Seawanhaka and Atlantic, in the New York Y. C. and the Larchmont Y C. The various special classes, such as the misnamed "34-raters," etc., will be abolished, the yachts finding their places in the different regular classes; the allowance table will be uniform; time allowance will be abolished among yachts built after the present season; the crew limit and the class designations will also be uniform. In this latter detail a very good plan has been adopted, of allotting a letter of the International Code to each class as a permanent signal for the class; the answering pennant being pressed into service as "A" for the largest class.

But one result can follow these changes. Yacht racing will be made more thoroughly systematic, the last traces of the old haphazard, go-as-you-please methods will be eliminated, and the sport will be far more interesting and exciting, with greater inducements to owners to follow the races regularly through the season.

THESE changes, important as they may be, are after all matters of detail. The one main point of the present movement involves a question which must exert a very strong influence on the yachts which it is confidently hoped may be launched in the near future—the limitation of draft. Yachtsmen the world over have recognized for the past three or four years the mischievous tendency of modern designing, the increase of dimensions and the decrease of displacement, the substitution of the long lever and light weight for the shorter lever and greater weight as the means of carrying sail; the extreme light construction, the faulty lateral plane and the increased sail plans. Many remedies have been suggested, and one has even been tried with small success. That some remedy must be found is indispensable; in spite of the fact that the practicable limit of draft has already been passed, it is still possible to outbuild the most extreme of new yachts by others a little deeper in draft and of reduced displacement. At the same time it does not follow that the case is now so bad that it cannot be made very much worse, or that any change must be for the better. In studying carefully the important step now proposed by the clubs mentioned, the imposition of an arbitrary limit of draft, we cannot avoid the conclusion that the work has been carried on too hurriedly, that very important considerations have been ignored, and that if any general revival of building takes place under the rule, the resulting type will be most undesirable and detrimental to yacht building and racing.

The proposal, as elsewhere stated, is to place an arbitrary limitation on the draft of yachts in each class, with a certain penalty for any excess. The very first idea that would suggest itself in this connection is the imperative necessity

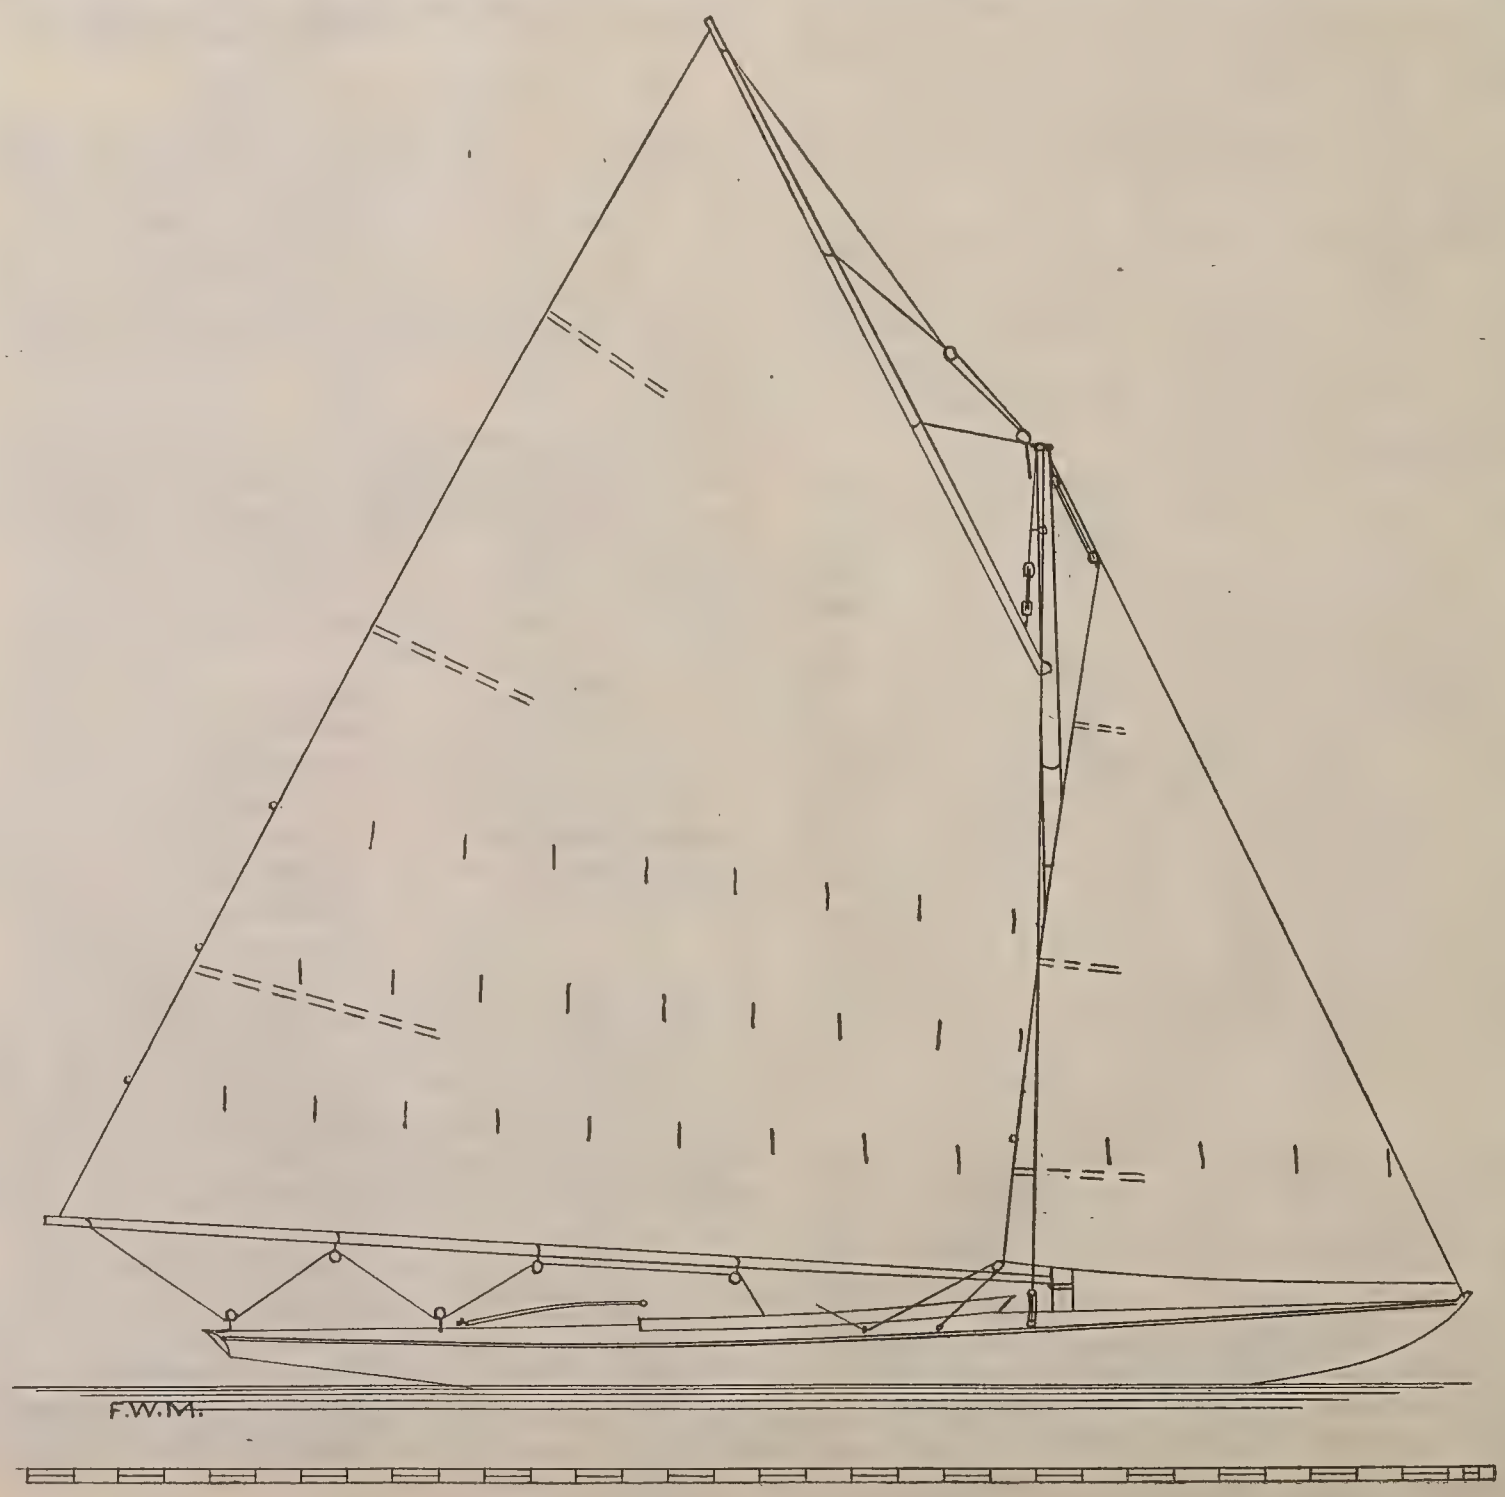
TZIN—BODY PLAN.

of protecting both the keel and the centerboard types from unfair discrimination, in accordance with the whole policy of American yachting in the past, permitting fair play to both. That this point has not been considered in framing the proposed limitation is very evident upon inspection; and it is equally plain that any competition under the rule must produce one type of yacht, and that, we believe, a very undesirable type.

Taking first the single-masted classes, which in all clubs but the New York Y. C. run from 15ft. racing length to 70ft., not including the unlimited class, the limits of draft proposed are plainly derived from actual practice, as found in existing yachts, and for keel boats they are very satisfactory. If they applied solely to the keel type, with a separate provision for the centerboard type, no fault could be found, but they do not; the only proviso is that the centerboard shall not be measured in the draft. One need not look ahead very far to see what the result must inevitably be; the rule is a direct premium on what may be called the "Jubilee" type: the canoe hull, the narrow fin, with the bulb carried at the extreme limit of draft, and in addition a plate board of more or less weight housing in the fin. The rule in its intent does not go far enough in penalizing the fin type and promoting the yacht of greater body, even as applied only to keel boats; but with such a limitation it could do little harm. With the centerboard thrown in free, there can be no chance for the restoration of such a type as yachtsmen are now looking for, of reasonable dimensions and accommodation, and yet fairly fast.

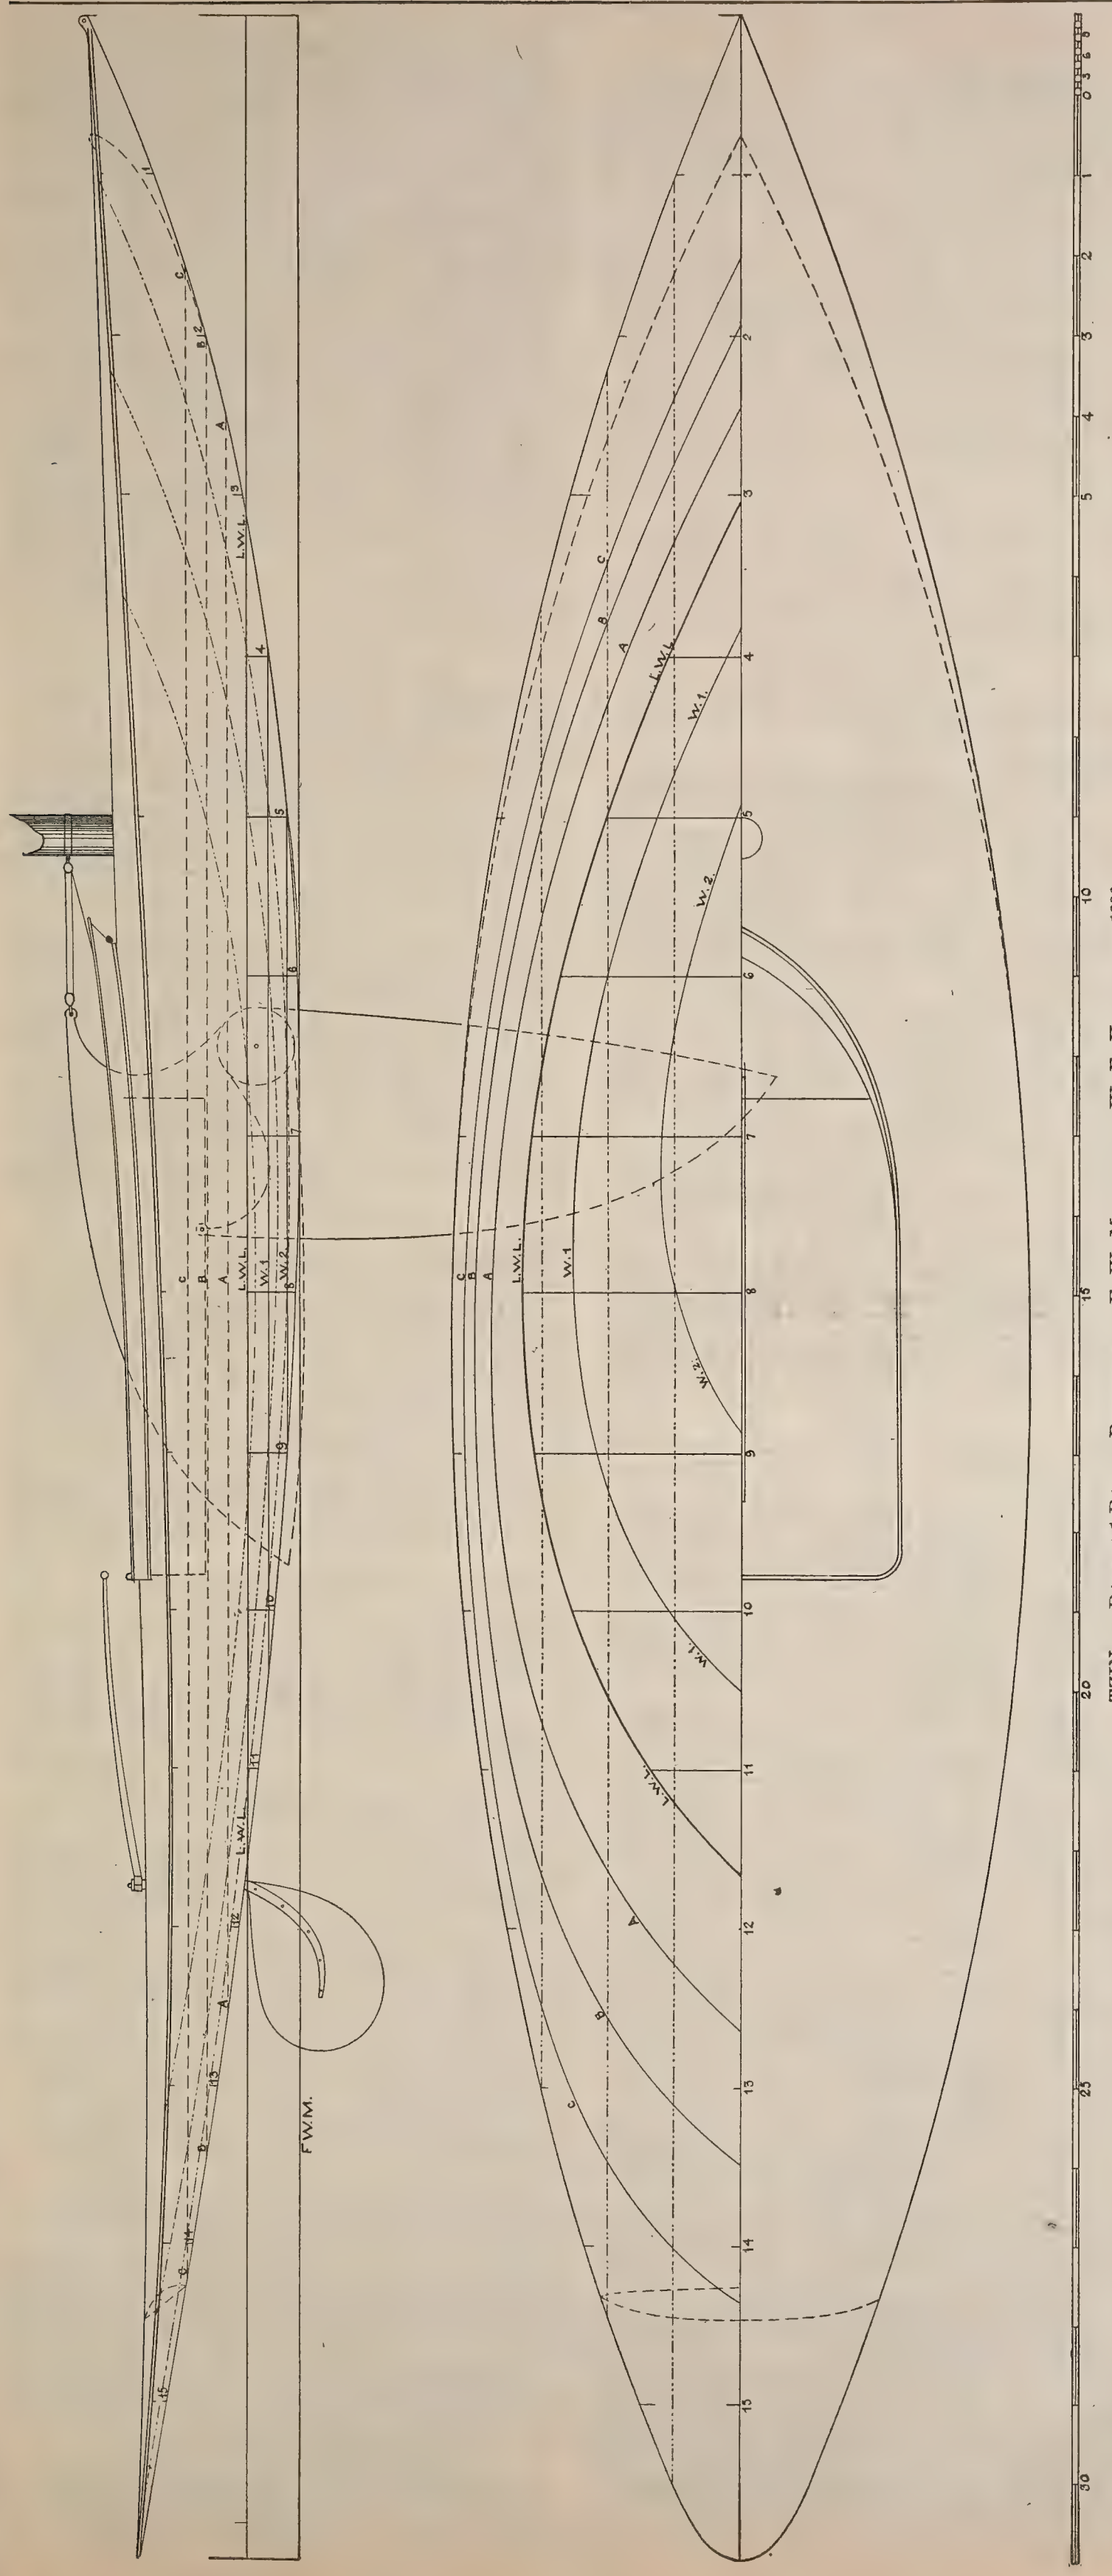
It may be that in some classes the conditions will result in a keel boat—for instance, something between the Wasp and Uvira types—and not in the centerboard-bulb-fin, but we doubt it; and we do not look for any healthy development of the keel yacht.

At the same time it is still more certain that under such a limitation there is no chance whatever for another useful type; the deep centerboard boat of good body, such as may be designated as the "Harpoon" type—such a yacht of say 9ft. draft for a measurement of 60ft., would have no chance whatever against a craft of 11ft. 6in. draft, and also equipped with a centerboard.



If it is desirable either to encourage the keel boat alone of such general type as indicated by Minerva, Uvira and Gloriana, or to encourage side by side with it the moderately deep centerboard boat of the type of Nymph and Harpoon, then a different plan must be adopted. The limits as already set will answer well enough for keel boats, but it should further be provided that centerboard boats shall not exceed in draft a certain fraction, say 70 per cent., of the limit for keel boats in the same class. Such a limitation as this would recognize and estimate at about its proper value the difference of draft existing in actual practice prior to the introduction of the bulb-fin, as in the old 30ft., 40ft., 46ft. and 70ft. classes; it would be unfair to no one, and would undeniably exercise a radically different influence on designing, as compared with that of the proposed rule.

In the schooner classes the general result is the same, though under somewhat different conditions. The schooner is less of a racing boat than the cutter, and has never reached the same point of development in speed, while more has always been expected of her in cruising and general all-round use. Owing to her greater size, the proportionate limit of draft has been kept below that of the single-stickers, and the centerboard has been used in all racing schooners. In this rig, whatever the class, the centerboard has been proven far more valuable and practicable than the keel type for racing, just as the reverse has been the case with the single-stickers. If the tendency of the proposed change were merely to bar the keel schooner, we should make no objection to it, as we recognize the superiority of the centerboard type as exemplified by such yachts as Quickstep, Iroquois, Ariel, Lasca and Volunteer. Such, however, is very far from being the case. Under the rule as it is proposed there is no possibility of the restoration of this general type in a modernized form; but it must give place to the "Jubilee" type, the centerboard-bulb-fin, with all of its disadvantages. It is obvious that, while in the single-stick classes the figures are based on existing practice in keel craft, in the schooner classes nothing has been considered but the most extreme point yet reached in the centerboard type—Quissetta, Amorita and Colonia. The limitation in the 75ft. class is the designed draft of Amorita, about 3in. less than her present draft; that of Quissetta being about in the same proportion, 11ft. on 66ft. l.w.l.; and in the 95ft. class it is but little under the draft of Colonia as a schooner.



The result of the rule in the smallest schooner class is something for yachtsmen to contemplate, a boat of about 62ft. l.w.l. for her class limit of 65ft. racing length, and drawing 11ft. In the next class come Amorita and Quissetta, with 12ft. draft. What chance is there for the once popular and useful all-round schooner such as Shamrock or Quickstep?

If the end in view is not the direct encouragement of a bastard fin type, but the general good of yachting, and the promotion of yacht racing by inducing men to build and race yachts of moderate types, then the limits in the schooner classes might better begin at 7ft. in place of 11, and end at 12ft. in place of 14, with intermediate figures of 9ft. for the 75ft. and 10ft. 6in. for the 85ft. classes; while in the single-stick division the present limits should apply solely to keel craft, with a decrease to 70 per cent. for centerboard boats.

If it be decided that such a change is desirable, there is

TZIN.—SAIL PLAN.

little in the way of vested interests to interfere; in the single-stick division the field is practically clear, there are none but old boats in the racing; in the schooner division are Colonia, Amorita and Quissetta, all of which may be rated by some arbitrary arrangement against any new yachts built to the lessened limit.

At best the limitation of draft is a very inadequate attempt at the solution of the present difficulty, and the good which it can do is limited to two details. In the first place, with the limits as now set, it can prevent the building of anything more extreme than Amorita and Quissetta, but these two are so far beyond what is good and desirable that it makes little difference whether the next new boat is worse or only as bad.

In the second place, if the limit of draft be made small enough in each class, it will discriminate to a certain extent against the fin type and tend to promote a better and roomier type; the lever being shortened to an appreciable extent as compared with the extreme fin, the designer must take more weight, in the form of displacement, in order to carry an effective sail plan, unless, indeed, he chooses to take more length and less sail with an easier form. It will be seen, then, that the good results of the proposed change are but doubtful at best and of limited extent, while the possibilities for evil, in the placing of a direct premium upon the bulb-fin type with centerboard added, are almost unlimited.

THE new idea of allotting a designating number to each class, based on the Commercial Code, is an excellent one; but as it is proposed to apply it the objection arises which we have so often made in the past against the prevailing system of class nomenclature. The proper designation for a racing class is not an abitrary symbol of any kind, but the figure denoting the upper limit of the class, as the "40ft.," "10 ton," "20-rating," etc. This is exact, definite and self-explanatory, and it is not necessary to commit to memory a list of twenty or more classes. The practice in the past has been as bad as it could be; a yacht might be in Class IV. in one club, in Class F in another, in Class 7 in another, and so through the list, a few clubs, as the Seawanhaka, using the proper designation, 40ft. class. The case is not quite as bad under the proposed system; there being but one set of arbitrary designations instead of a dozen, yachtsmen will be able to commit them to memory more readily; but it would be better in every way if each class were known by the figure of its upper limit.

THE arrangement of the classes, with graduated intervals, is now very satisfactory, far better than has before existed, and one or two useless classes have been dropped. It is still the case, however, that there are two many classes on paper; and now is the time to remedy the matter before the same trouble is materialized in wood and steel. The matter is a very easy one to deal with; all that is necessary is an announcement on the part of the clubs that they will give prizes only in certain classes, to which men who would race must build. In the smaller sizes there is a need for numerous classes, and the very large number of yachtsmen of limited means can support these classes. In the larger sizes, however, there is every necessity to concentrate the building on a small number of classes, as better prizes can be given and there will be more entries in a given class. Looking at the question with a view to actual figures, all of the smaller classes, 15ft., 20ft., 25ft. and 30ft., should stand as at present, as they will find ample support among the numerous smaller clubs. The 36ft. class (the old 30ft. l.w.l. class) might be retained; then the next, 43ft., might be allowed to lapse; the proposed new boats of the 51ft. class (a modification of the old 40ft.) will establish it; and the next, 60ft., may well be dropped, tending to revive and strengthen the 70ft., a far more desirable class.

Similarly, in the schooner division there is no need whatever for the creation of the proposed 65ft. class, in which no boats now exist; the 75ft. class has already two new yachts, Amorita and Quissetta, and of course will stand; the 85ft. class may well be dropped, leaving the 95ft. as the largest regular schooner class. A look at the list of yachts which raced this past season will show that this change will affect unfavorably but very few, these few being liable to outbuilding in any event by new boats in their classes. So far as new yachts are concerned, there can be no objection to such action on the part of the clubs; given, for instance, the three sizes, 36ft., 51ft. and 70ft, a yachtsman intending to build for racing should welcome an arrangement which tended to strengthen both in entries and prizes these classes, rather than the old system of innumerable classes, inadequate prizes and few entries.

TZIN.

Racing One-Rater.

THE present development of yachting in the middle West is marked by two interesting features. The sport is growing strongly and rapidly on the numerous small fresh-water lakes in the States of Wisconsin and Minnesota, being supported by many wealthy residents of Chicago, Minneapolis and other Western cities who make their summer homes about these lakes. Competition is very keen, not only on each lake, but between the clubs of different lakes, the leading cracks being sent by wagon or rail to other localities for match races. On these lakes are found racing craft by all the leading designers—Herreshoff, Linton Hope, and others equally well known—while in competition with them, and often defeating them, are boats by local designers.

This large fleet was originally almost entirely of the sand-bag type, imported from Long Island Sound and Boston, first the noted New York boats being purchased, and later orders being sent East for new boats by the same designers to beat them. Within the past season a marked change has taken place in the partial abandonment of the old type, with shifting ballast, and large if not unlimited crews, in favor of yachts of 15 to 20ft. racing length, much the same as the old English one-raters and half-raters, and sailed with fixed ballast and crews of three or four at most. While different rules for the new class have been made by the various clubs, the boats are approximately of 15ft. and 20ft. measurement by the Seawanhaka rule.

The design here illustrated, for which we are indebted to the designer, F. W. Martin, superintendent of the Racine Yacht and Boat Works, was made for the new class of the Green Lake Y. C., of Dartford, Wis.; being owned by W. E Haseltine, secretary-treasurer of the club. She is one of a number of 20-footers and 15 footers built by the R. Y. & B. W. last winter at their works at Racine Junction, Wis. the others, with one exception, Pleasant Pain being

double-skin mahogany construction, with hollow spars, silk sails and very elaborate finish. Tzin, however, was built of Michigan or Canada white cedar, an inner diagonal skin of $\frac{3}{16}$in., and an outer fore and aft skin of $\frac{1}{4}$in. There were no frames, only a few hackmatack floors at mast and abreast the trunk, but the bilge was stiffened by two bilge clamps of cedar $\frac{1}{4}\times\frac{3}{8}$in., while the main clamp was of American elm, $\frac{1}{8}\times1\frac{1}{2}$in. The keel was of elm, rabbeted; the diagonal planking was copper-nailed and riveted to the keel, the clamp and the bilge clamps; it was coated with a mixture of rosin, beeswax, pine tar and linseed oil, worked on hot; then a thickness of Egyptian cotton cloth was laid on, and the mixture sweated through. The outer strakes were each treated with the hot mixture before being fastened in place, being finally copper-nailed and riveted over a special make of burr adapted to the soft nature of the cedar.

The centerboard trunk was made of $\frac{1}{8}$in. cedar in two whole pieces, tapering to $\frac{1}{4}$in. at the top, which was stiffened by a ledge to carry the floor beams; no headledges were used, one-half of the slot being worked out of each plank, the two being then riveted together at the ends. Where the pin of the centerboard passed through, the cedar was reinforced by a piece of oak dovetailed in across the grain.

The deck beams are of cedar, $1\frac{1}{2}\times\frac{1}{2}$in., spaced 30in. apart, with two light, bent carlins spaced between each pair of beams. The deck planks are of $\frac{3}{16}$in. cedar, 6in. wide, and under each seam is a ribband of cedar $\frac{3}{4}\times\frac{1}{4}$in., gained in flush with the tops of the main beams and lying on top of

TZIN.

the carlins. The deck is covered with wide sheeting, sweated down into the mixture already mentioned, and then painted, three coats being put on, each well sandpapered down, finishing with varnish. The outside of the planking was finished in English white enamel.

The watertight, self-draining cockpit was built with a cedar floor, the seams battened; but from the swash through the trunk when under way and the drying when at anchor the floor shrunk and could not be kept tight. At the middle of the season, after the yacht had raced for a time, Mr. Martin fitted a copper lining to the cockpit, the sides being carried up and made watertight under the coaming, with a light wooden grating to protect the bottom. This proved perfectly watertight and very satisfactory. Small hand-hole plates, as used for hatches in canoes, were placed to ventilate each compartment. The centerboard is of $\frac{1}{4}$in. steel, of the shape shown. The original design called for a 300lb. board, but the thin one was finally decided on, and two pigs of lead were shipped and lashed amidships to make up the loss in weight. The rudder has a steel stock and a wooden blade. The deck fittings are all very light, including two forged steel travelers and a stem band. The tiller is of second growth hickory, bent to shape, and stepped in a bronze socket which fits the rudderhead. The rudder trunk is of steel bicycle tubing, flanged and brazed into a special bronze plate at the bottom of keel, and counter-bored into a bronze bearing on deck. The chainplates are bent steel straps, with special deadeyes at deck, running down to the keel and there fastened to the mast step. The mast, boom and gaff are of balsam pine, solid, but very light and strong. The sails are of Egyptian cotton. The blocks are of wood, rather large, but light. The standing rigging is of steel, set up by lanyards. The entire weight of hull, without centerboard and rudder, was 470lbs. in the shop.

The yacht was originally designed with an over all length of 32ft., as shown in the plans, but at the annual meeting of the club in Chicago last winter it was decided to prohibit more than one-third of the waterline length in overhang as a means of protection to the old-time boats with short ends and great beam, with accompanying big sail plans. As it happened, this step proved fruitless, the newer and smaller boats outsailing the old sandbaggers by about one minute to the mile over the club course, 12 miles.

Owing to this restriction on the overhang, Tzin was built to the dotted lines shown, the ends of the original design being reduced considerably. Another yacht, however, was built to the full length, 32ft. over all, for Signor S. P. Fachutar, of the Pewaukee Y. C., being named Carmula. She is one of the finest yachts built by the Racine Yacht and Boat Works last season, both skins being of mahogany, as well as the planksheer and partners; while the deck, of $\frac{1}{2}\times\frac{3}{4}$in. pine, was bent to shape and blind-fastened. The centerboard was of phosphor bronze, 300lbs. weight; the spars were hollow, and the sails were of Union silk, the rig being a lug with roller jib. The deck fittings were very elaborate, including a light rail around the entire deck. Though fast, she is rather overweighted with fittings, etc., for the class.

Tzin's dimensions are:

Length over all	27ft.	7in.
l.w.l.	17ft.	
Overhang, bow	4ft.	9in.
stern	5ft.	10in.
Beam, extreme	7ft.	3½in.
l.w.l.	5ft.	6in.
Freeboard	1ft.	
Sheer, bow		10½in.
stern		2in.
Mast, from stem at l.w.l.	4ft.	
deck to hounds	18ft.	10in.
Boom	22ft.	
Gaff	16ft.	
Mainsail, area, sq. ft.	336	
Jib, sq. ft.	76	
Total sail	412	

Tzin's record for her first season is:

July 4, Revel cup race	Fouled buoy.
July 18	First.
July 25, Commodore's cup	Second.
Aug. 8, Oakwood cup	First.
Aug. 17	Second.
Aug. 22	First.
Aug. 29	First.

Total, four firsts, two seconds and once disqualified for fouling mark, giving her the championship pennant of the club. Her owner states that she is good to windward, but does her best work reaching and running, and in a moderately strong breeze. She is a good sea boat, and not specially wet for a racing boat in rough water.

The America's Cup.

A CORRESPONDENT of *Engineering* (London) writes to that paper as follows, outlining a new and definitely organized scheme for the regaining of the America's Cup:

Editor Engineering:

I think that if the America's Cup is to eventually come here, as I feel sure it ultimately will, the conditions under which a yacht, built for the purpose of securing it, is constructed should approximate those prevailing on the American side.

I want to see the Cup won on the old course first, and then to insist on neutral ground being fixed equally distant from both shores, so that the labor of reaching the scene will be fairly apportioned to each of the competitors.

The suggestion I wish to make is that you invite public subscription for the purpose of building say four racing yachts of the length limited by the "deed of gift," designs for such yachts to be thrown open to the designing talent of the country. These could be referred to a committee composed of scientific men assisted by expert yachtsmen. The designs considered best to be the basis of the building, and might carry a premium.

The boats when built to be tested separately and together, interchanging the skippers to eliminate the personal element.

The best out of three contests to be considered the winner.

I am convinced that it is only when the talent of the country is brought into requisition the "event" can be fairly considered "international;" otherwise it is merely a private trial of rivals. The public at large, by entering into the scheme, having direct personal interest in the issue, would thus stimulate the designers to their best efforts.

Without desiring to prescribe the names of the "committee," I venture to express the conviction that it would be incomplete without the inclusion of Mr. Yarrow and Mr. Froude, provided they are willing.

The former gentleman, by his great experience in high-powered, light-scantlinged vessels, and the latter by his deservedly high place in researches on resistance and forms of vessels, would be invaluable in determining the merits of the designs.

This suggestion is made sincerely, conveying no reflection on the present designers of yachts. It is made in no one's interest, but on public scientific grounds alone. I am certain there are many in this great maritime country who merely want the chance of exhibiting their talent to prove that the supremacy of this nation, both practically and theoretically, in every field covered by the term "naval architecture," when it is awake, can be maintained just as proudly and easily by the children of Nelson in this day as their ancestors showed so brilliantly, under entirely different conditions, that it could in the past.

J. J. O'NEILL.

Sept. 21.

Varuna.

THE new steam yacht Varuna, designed by Watson for Eugene Higgins, of New York, is described as follows in the European edition of the New York *Herald:*

"I fancy she does credit to her builders," said Mr. John Inglis modestly, adding, "and of course to her designer. She's indeed a bonny boat, and her owner will be satisfied with her. We have, of course, kept strictly to Mr Watson's designs, and it may be there are some details with which I should not agree had I been the designer of the boat myself. But that's neither here nor there. If he and Mr. Higgins are satisfied so am I."

Undoubtedly the most striking figure of the Varuna is the vastness of her accommodations. Apart from the owner's suite of rooms and saloons, there are two large and three somewhat smaller staterooms below the main deck, besides a room intended for bachelor guests extending right across the ship. Mr. Higgins need not stint himself in the matter of company on board his new yacht.

Of 1,520 tons, Thames measurement, the Varuna, which is built of steel throughout, the top sides being flush plated, with continuous edge strips fitted inside, has the following dimensions: Length on l.w.l., 260ft.; length over taffrail and figurehead, 300ft.; extreme breadth, 35ft. 2in.; depth (to bridge deck), 28ft.

It is to the size of her bridge deck that the Varuna owes, in greatest measure, the exceptional character of her accommodations. This deck is 168ft. in length. For 40ft. at either end it is supported on stanchions at the ship's sides, while the remaining portion, nearly 90ft. in length, is covered in.

Here are the chief rooms: The owner's suite, dining room, fencing room, chart room, drawing room and two large staterooms.

The dining room also extends across the ship, lying between the boiler and engine rooms, from which latter the two sets of triple expansion engines, with which the Varuna is supplied, can be viewed at work. The measurements of the dining room are about 18ft.×34ft. It is fitted up in paneled oak, and will possess all the requisite furnishings.

From the dining room entrance can be had to the library, with an area of some 187sq ft., and a total wall length of over 50ft., quite enough to allow of bookcases containing a plenty of literature

This library is aft of a series of rooms for maids and valets, and lavatories and bath rooms for guests arranged alongside the casing on the starboard side, and alongside the after end of the dining room is a vestibule floored with rubber tiling.

Here is to be seen a novelty—a watertight gangway, with an accommodation ladder, by means of which entrance can be had to the vestibule when the ship is afloat.

Passing abaft the engine room, you come to the drawing room and what is called the fencing room, which together form an after deckhouse on the main deck. The former is 18ft. square, while the latter measures 16ft by 17ft., and is provided with cabinets, racks for foils, dumb bells, clubs and other accessories for physical exercise.

The floor of this gymnasium is of rubber tiling, while the walls are paneled in wainscot oak, above this dado being covered with neatly painted Tynecastle canvas. By the way, the same material is used for the ceilings of the dining, drawing and owner's rooms, painted and gilded in harmony with the other fittings. The walls of the drawing room are in mahogany.

Light and ventilation are amply provided for, there being no less than twenty-two large square ports in the drawing room and fencing room alone, while altogether the number of sidelights fitted to rooms under the bridge deck is fifty-seven, inclusive of the fourteen already mentioned as opening on the owner's suite.

Furthermore, a large circular skylight is fitted over the fencing room, and in this is placed an electrically driven Blackman ventilating fan.

Finally, to conclude this enumeration of the accommodations under the bridge deck, there are two large staterooms fitted up in mahogany, and painted enameled white. These rooms measure 15ft. by 14ft., and 12ft. by 14ft., respectively.

Going below, there is further accommodation for guests all abaft the machinery space. On this lower deck are two large staterooms, respectively measuring 14ft. square and 11ft. by 17ft.; and also three others about 10ft. by 11ft. All these are paneled in mahogany.

In addition there is the large bachelors' cabin already referred to, and extending right across the ship.

Here there are two bath rooms, with tiled floors and dadoes of tiling; while contiguous is the doctor's room, and abaft accommodation for valets in a room measuring 9ft. by 17ft.

When it is added that these guests' rooms will be upholstered in some cases in luxurious fashion, and in all in a manner providing sound, solid comfort, and that the latest ideas in the matter of conveniences and fittings will be utilized, a number of well-known firms being engaged to supplement the work of Messrs. Inglis it is apparent that Mr. Eugene Higgins's guests will be favored individuals.

Between the bridge deck and the forecastle deck there is a break deck, level with the rail, and underneath which are the storerooms, clothes lockers and magazine for the ammunition for the rapid fire guns and other ordnance the Varuna will carry.

It is scarcely necessary to say of a modern steam yacht that she will be lighted throughout by electricity. The Varuna carries two engines and dynamos, coupled together, for this purpose, and there are also storage cells in the after hold for requisition when the dynamos are not running.

Electricity is also the motive power for fans that are placed in the owner's rooms, the saloons and all the guests' rooms, while there are electric bells throughout the vessel.

Going up to the bridge deck—by the way, a peculiarity of the Varuna is that all her gangways run athwart, instead of, as is usually the case, with the ship—we find, immediately in front of the funnel casing, a deckhouse built entirely of teak, and comprising a wheelhouse, chart room and entrance way to the main deck.

This deckhouse is 21ft in length and 13ft. in breadth. Its various divisions are all paneled in oak and the floor laid with rubber tiling.

Then, on the bridge deck, but abaft the funnel casing, is a second deckhouse 2ft longer than its counterpart forward, the measurement being 23ft.×13ft., and, like the other one, built entirely of teak This second deckhouse consists almost wholly of a room described as a breakfast or smoking room, the walls of which are paneled in mahogany and the floor laid in feather or groove-jointed oak, elaborately planed and waxed. Here is an entrance way to the after rooms on the main deck.

The Varuna is a twin-screw vessel, carrying two sets of triple expansion engines, four cylinders, 22½, 38, 40 and 42in. in diameter, each set, and two boilers 11ft. 9in. long and 17ft. 6in. in diameter, placed back to back in the center of the ship.

New York Y. C.

AN important meeting of the New York Y. C. will be held on Thursday of this week, as will be seen from the following notices of proposed amendments to the racing rules.

The fifth general meeting of the club will be held at the club house, Thursday, Oct. 22, at 8:30 P. M. The committee to nominate officers and standing committees for the year 1897 will be balloted for at this meeting. The following amendment to Chapter IV. of the by-laws, passed at the second general meeting, and laid on the table at the third general meeting, will be taken up for final consideration:

Add at the end of first paragraph: "Yachts complying with the foregoing conditions, except as to capacity, but having a capacity of less than 15 tons and not less than 10 tons, ascertained and certified as herein provided, shall be entitled to representation for all purposes except voting at meetings."

The following amendments to the racing rules will be presented:

RULE I.

Sec. 2, to read: Schooners—Class A, all over 95ft. racing length. Class B, not over 95 and over 85ft racing length. Class C, not over 85 and over 75ft. racing length. Class D, not over 75 and over 65ft. racing length. Class F, not over 65ft. racing length.

Single-masted Vessels and Yawls.—Class G, all over 70ft. racing length. Class H, not over 70 and over 60ft. racing length. Class J, not over 60 and over 51ft. racing length. Class K, not over 51 and over 43ft. racing length. Class L, not over 43 and over 36ft. racing length. Class M, not over 36ft. racing length.

Sec 3, to read: The regatta committee, with the approval of the commodore, may establish special classes for any regatta.

Sec. 4, to read: Limit of Drafts.—The maximum draft of any yacht when in racing trim shall not exceed that specified for her class in the following table, exclusive of centerboard, except as hereafter mentioned.

Schooners.—Class A, over 95ft. R. L.; draft, no limit. Class B, not over 95ft. R. L; draft, 14ft. Class C, not over 85ft. R. L; draft, 13ft. Class D, not over 75ft. R. L.; draft, 12ft. Class F, not over 65ft. R. L.; draft, 11ft.

Single-masted Vessels and Yawls.—Class G, over 70ft. R. L.; draft, no limit. Class H, not over 70ft. R. L.; draft, 13ft. Class J, not over 60ft. R. L; draft, 11.5ft. Class K, not over 51ft. R. L.; draft, 10ft. Class L, not over 43ft. R. L.; draft, 9ft. Class M, not over 36ft. R. L.; draft, 8ft.

Any yacht whose draft exceeds that allowed in her class shall be eligible to race in such class, but the amount of excess shall, in computing her measurement for racing length, be multiplied by two and added to the L.W.L.; provided, however, that in no case shall such excess be more than 10 per cent. of the draft allowed in her respective class. On all yachts launched after Nov. 1, 1896, there shall be placed upon the hull, and immediately over the point of greatest draft, a metal plate or other distinct mark. Such mark shall be placed over the L.W.L., and within 6in. of it; and the owner shall furnish to the regatta committee a certificate of the vessel's draft to such mark, signed by himself, the designer or the builder of the yacht.

Change Sec. 4 to Sec. 6.

New Sec. 5. To read: Any yacht launched after Nov. 1, 1896, except in classes A of schooners and G of single-masted vessels and yawls, shall not be entitled to any time allowance from other yachts in her class, except as provided in Sec. 3 of Rule IV. and in special races, when it must be so stated in the notice of the race.

RULE II.

In third line, change the word 94 to read 93 per cent.

RULE IV.

Sec. 3. To read: The regatta committee may refuse or accept any entry made after the time of closing.

Change present Sec. 3 to Sec. 4 and to read: At least two yachts must start in each class to entitle a yacht to a prize. Any yacht alone in her class may sail in the class next above, but in such class such yacht shall assume and be entered as of the minimum racing length specified for the class in which she so enters; but this shall not be so construed as to permit a single-masted vessel or yawl to enter in a schooner class.

Eliminate the present Sec. 4, as it is provided for in the proposed Sec. 3 of Rule I.

RULE VI.—BOATS AND LIFE BUOYS.

Sec 1. To read: All yachts shall carry at least two serviceable life buoys on deck ready for use.

Sec. 2. To read: Classes A, B, C of schooners and G of single-masted vessels and yawls shall carry on deck a serviceable round-bottom boat with oars and rowlocks or tholepins lashed in, not less than 14ft. in length, and classes D and F of schooners and H of single-masted vessels and yawls a boat as above not less than 12ft. in length.

RULE VII.

Sec. 1. Add at the end of the third line after the words "kept on board," to read: All yachts, except in classes A of schooners and G of single-masted vessels and yawls shall keep their galley and forecastle fixtures and fittings on board and in their proper places.

RULE VIII.—CREW.

To read: The number of men permitted on a yacht during a race shall not exceed that given by the following table:

Schooners—Class A: 1 man to every 2ft. of R. L. or fraction thereof. Class B, 95ft. R. L, 35 men. Class C, 85ft. R. L., 30 men. Class D, 75ft. R. L, 25 men. Class F, 65ft. R. L., 20 men.

Single-masted Vessels and Yawls.—Class G, 3 men to every 5ft. of R. L or fraction thereof. Class H, 70ft. R. L, 20 men. Class J, 60ft. R. L, 15 men. Class K, 51ft. R. L, 12 men. Class L, 43ft. R. L., 9 men. Class M, 36ft. R. L., 7 men.

RULE IX.

Sec. 3. On the second line, after the words "and display her" to read, racing number above the reef points at an equal distance from the luff and leach on both sides of the mainsail.

RULE XVII.

Sec. 3. To read: If a yacht, after having been officially measured, makes changes in her trim, causing an increase of l.w.l., or makes alterations in her sail plan, should enter a race without remeasurement or notifying the regatta committee in writing that alterations have been made, and a request for remeasurement, she shall be disqualified.

Change Sec. 3 to Sec. 4, and the fourth word of said section to read "shall" instead of "may."

Page 163, under table of time allowance, on the eighth line change the words 50 per cent. to read 60 per cent., and the table of time allowance to be changed in accordance therewith.

YACHTING NEWS NOTES.

THE new consolidated firms of Gas Engine and Power Company and Charles L. Seabury & Company, Morris Heights, N. Y., have up to the present date the following contracts in hand: Steel steam yacht for Charles Fleischmann, 170ft. long, 138ft. l.w.l., 21ft. beam, 8ft. draft, with a "Seabury" triple expansion marine engine of most approved

design, and a "Seabury" patent safety water tube boiler of latest type. The guaranteed speed is eighteen miles. The yacht will be lighted by electricity and heated by steam throughout, and will carry a 25ft. naphtha launch on davits. She will be fitted with steam windlass, deckhouses on forward and after decks, and will be ready for service by June 1, 1897. The next yacht is for E. S. Woodward, of New York; 85ft. over all, 72ft. l.w.l., 13ft beam, 5ft. draft. With a flush deck she will have very fine accommodations for cruising. The owner's quarters will be aft, including two large staterooms, main saloon, toilet room, large wardrobe, wine locker, etc. The dining room will be in deckhouse forward, with dumbwaiter from galley below. The machinery will include a triple expansion engine of "Seabury" design and "Seabury" safety water tube boiler. The guaranteed speed is 15 miles. She will be ready for delivery by May, 1897. The next is a 65ft. twin screw naphtha yacht for the U S Lighthouse Department, which is to be used as tender at the Charleston (S. C.) district. This boat will be fitted with two 12 h. p naphtha motors, twin screw, and will have a pilot house, saloon, toilet, galley, crew's quarters, engine room, after cockpit, etc. She will be copper sheathed on bottom, and will be ready for delivery in three months. The firm have also in hand a 40ft. steam launch for Messrs. Flint, Eddy & Co, for export, to be finished by Nov. 15, 1896 This boat has 6ft 10in. beam and draws 2ft. 6in.; fitted with a simple engine and a "Seabury" safety water tube boiler arranged to burn wood; the speed being 10 miles. She will be shipped to Mexico. There is also on the stocks a 40ft. cabin naphtha launch for a private party and several smaller launches for customers.

The firm are also building a number of the famous "Seabury" boilers and engines for yachts and launches.

Marvel & Co., of Newburgh, N. Y., have in hand a steam yacht of peculiar design for a New York yachtsman. The yacht was designed by H. C Wintringham, and will be of steel, with twin screws, the dimensions being: Over all 125ft., l.w l. 116ft, beam 30ft., depth 10ft. 3in., and draft 5ft. The pilot house will be 13ft.×9ft., and the main deckhouse 34ft.×13ft. The interior arrangements are very convenient. The engines will be of triple expansion type, 6¼, 10 and 16×10in. The yacht will make a cruise to the South as soon as completed.

The Almy Water Tube Boiler Co. has issued a very neat catalogue of its boilers, which are now in high favor with yachtsmen. The firm has now in hand a new boiler for the yacht Puzzle. It is also making a new feed water regulator for stationary and marine boilers.

The Seawanhaka Cor. Y. C. has just leased a large city house on the north side of Twenty-second street, east of Broadway, and will soon be once more established in permanent town quarters. The house will be fitted up specially for the accommodation of the club, with billiard room, meeting and lecture rooms, etc., and, in addition, the rooms on the upper floors will be rented to members.

The Lincoln Park Y. C. has joined in the general movement for a consolidation of all the Chicago yacht clubs. At the regular monthly meeting at the Sherman House on Oct. 13 a committee was appointed to confer with the committees from the Columbia and the Chicago clubs to take steps toward that end. The committee consists of Geo. Warrington, Thos. Simpson and C. O. Andrews. At present no definite plans for consolidation have been evolved, but it is hoped to unite under the common name of the Chicago Y. C if the charter can be procured. Little other business was done except the election of the following new members: Gen. J. T. Torrence, F. L. Danforth and F. Matherson. The committee will report on the matter of consolidation at the next monthly meeting.—*Chicago Record.*

On the morning of Oct. 11, while the big northeaster was at its height, the steam yacht Oneida, with ex-Com. Benedict aboard, arrived at Greenwich to lay up. During the morning the sloop Addie O., of Greenwich, with her owner, W. B. Owens, and four others aboard, started out for a sail, and when off Captain's Island she was completely overpowered by the sea, her crew losing all control of her. Seeing her danger from the shore, Com. Benedict called his captain and one of Oneida's crew and put out in the small vapor launch to the rescue. After much difficulty and danger a line was finally passed to the sloop and an attempt was made to tow her into Greenwich, but in the face of the gale and with the sloop partly waterlogged, the launch was unable to make way, and both boats were in danger of going on the rocks. Their position was seen by the crew of the Oneida and the larger launch was sent out, a second line was passed to the sloop and the two launches towed her into the harbor.

Canoeing.

THE proposals for amendment of the A. C. A. rules which we publish this week suggest that this work is now in order, and that all having proposals to be laid before the executive committee next month at the annual meeting should submit them immediately to E B. Edwards, chairman of the regatta committee, Petersborough, Canada. In order to be acted on at the meeting, such proposals must be incorporated in the report of the regatta committee and published in the FOREST AND STREAM for two weeks previous to the meeting. Through neglect on one hand or the other, this is seldom done, the work of amending the rules being left to a mail vote.

We would suggest to all who have proposals to submit that they look up the Year Book and make their proposals in the form of a carefully worded amendment to the proper rule, instead of a mere general suggestion that a change be made.

A. C. A. Racing Rules.

Editor Forest and Stream:

Mr. R. O. King, of the Toronto C. C., now residing in Cambridge, Mass., suggests the following changes in the rules governing paddling races:

Referring to A. C. A. Year Book, 1896:

I. For events 15, 17, 19, 22, 23, 24, 25, 27, 28 and upset race, canoes not to be more than 16ft. long, nor less than 30in. beam, nor less than 12in. deep. Weight not less than 40lbs. Single blades only to be used.

N. B.—In the upset race double blades might be allowed if decked canoes enter.

II. For Event 4 canoes must not be more than 16ft. long, nor less than 28in. beam, nor less than 8in. deep. No limit to weight. Single or double blades.

III. Events 26 and 18—Canoes not to be more than 20ft. long, nor less than 12in. deep, nor less than 30in. beam, nor less than 70lbs. in weight.

Rule I. has been in force in Montreal and vicinity for a number of years and has given great satisfaction.

Rule II. has not been changed except to be made more definite. In fact, very few changes have been made that will rule out any existing canoes. The whole has been made definite, which, as will be admitted by those reading the present rules, is a very desirable thing.

J. W. MCKENDRICK.

Rifle Range and Gallery.

Calumet Heights Riflemen.

CHICAGO, Ill., Oct. 10.—The scores made to-day by the members of the Calumet Heights Gun Club that use the small-bore were as follows:

Class A: 200yds., off-hand, standard target:

	No. 1.				
Paterson	2000204014—16		Black	0000000245—11	
Hobbs	4544444448—40—2—38		Harlan	3544544444—41—2—39	
Davis	3404444458—35		Lamphere	4345342334—35	
Norcom	2333400044—23				
	No. 2.

PATTY.

Shell Mound.

SAN FRANCISCO, Oct. 12.—Many marksmen visited Shell Mound Range yesterday. The weather conditions were only fair until late in the afternoon, when they improved. The most notable score made was that of F. O Young. With a Sharps military rifle on the circular 8in. bullseye he made 49 out of 50 possible.

Enthusiasm among the members of the Columbia Pistol and Rifle Club was at a high pitch. In this club there is a lively contest among the ladies for the trophy presented by William Glindemann; and it was acknowledged that the score of 26 made two weeks ago by Mrs. M. J White would be very hard to beat. Mrs. Crane started out yesterday with the determination to better the score, which she did, by Creedmoor rules. She tied Mrs. White's score on points and beat it with a 3, where in the other score there was a 6. Mrs. C. F. Waltham has also entered the competition, and promises to put up a good score before the year is over. Mrs. L. D. Adam and Mrs. J. P. Cosgrave are also among the most enthusiastic of rifle shots, and give promise of becoming experts ere long.

The scores made yesterday by members of the Columbia Pistol and Rifle Club on the Columbia target were as follows:

Rifle, for class medals—Champion class, 10 shots: A. Strecker 62, F. O. Young 76, D. W. McLaughlin 87.

First class: A. Gehret 84, A. B. Dorrell 92, F. E. Mason 94, George Schultz 141.

Second class: E. Jacobson 79, E. H. Bushnell 100, G. Bailey 113, A. H Hess 134, M. J. White 145

Unfred diamond medal, 3 shots: D. W. McLaughlin 13, A. H. Pape 15, Dr. L. O. Rodgers 15, F. O. Young 17, A. Strecker 17.

Rifle, record medal, 10 shots: Dr. L. O. Rodgers 59, F. O. Young 58, A. B. Dorrell 68, D. W. McLaughlin 70, H. R. Crane 84, F. E. Mason 94

Glindemann musket medal, 10 shots, Columbia target, Creedmoor count: F. O. Young 49, Ed Hovey 47, Col. S. I. Kellogg 45, F. H. Bushnell 44 P. Robertson 42.

On the pistol range, 50yds., Columbia target, the following scores were made on the club's class medal record:

Champion class, 10 shots: Ed. Hovey 49, J. E. Gorman 51, F. O. Young 53, S. I. Kellogg 56. A. H. Pape 55, C. M. Daiss 59.

First class: Dr. L. O. Rodgers 51, F. E. Mason 56, F. Baumgartner 62, A. Gehret 63, D. W. McLaughlin 68, A. B. Dorrell 69, M. J. White 80

Second class, 10 shots: G. W. Barley 66, F. H. Bushnell 68, O. A. Bremer 91, J. P. Cosgrave 123, A. H. Hesse 138.

Open to all comers, re-entry, 3 shots, pistol. Blanding medal: C M. Daiss 8, F. O. Young 8, A. H. Pape 9, J. E. Gorman 10, F. H. Bushnell 15

All-comers, re-entry, .22cal. rifle, medal, 5 shots: E. Jacobson 11, Mrs. L J. Crane 13, Mrs. M. J. White 19, Mrs. C. F. Waltham 21.

Glindemann ladies' trophy, 10 shots: Mrs. L. J. Crane 26, Mrs. C. F. Waltham 39, Mrs. M. J. White 57.

GERMANIA RIFLEMEN.

The members of the Germania Schuetzen Verein made the following scores to-day in the monthly contest for the club medal; 20 shots, German ring target:

First champion class: First prize, Dr. L. O. Rodgers, 481 rings; second prize, A. Mockn, 436. First and second classes not filled. Third class: First prize, H. Helbing, 402; second prize, J. D. Heise, 378. Fourth class: First prize, D. Solfield, 287; second prize, William Garms, 239 Best first shot, Dr. L. O. Rodgers, 24. Best last shot, F. P. Schuster, 23.

SAN FRANCISCO SCHUETZEN VEREIN.

In to-day's contest for the club's medal, members of the San Francisco Schuetzen Verein made the following scores on the German ring target, 20 shots, 200yds. range:

Champion class: A. H. Pape 426 rings. First class not filled. Second class: George Schultz 396. Third class: J. Gefkin 390. (Gefkin becomes the permanent owner of this medal.) Fourth class: John Tiedemann 367. Best first shot, D. B. Faktor 24; best last shot, H. F. Linkendy 24.

NORDDEUTSCHER SCHUETZEN CLUB.

The scores of the Norddeutscher Schuetzen Club in to-day's shoot were as below:

Bullseye contest, 20 shots, bullseye target, best centers measured by a machine: F. Rust 755 points, F. P. Schuster 853, A. F. Weyer 841, J. de Wit 977, H. Huber 1,087.

ROEEL.

Revolver Shooting in England.

LONDON, England, Sept. 25.—On Sept. 22 the South London Rifle Club had its usual weekly shoot at Staines's ranges The wind blew half a gale, and made revolver work very uncertain. Early in the day it was calmer, and Mr. Howe took advantage of the lull to put on a 41 at 20yds.; and a few hours later Mr. Winans, during a lull, made the best on record score for the two ranges, 20 and 50yds, as follows:

50yds.....677667—39 20yds.....777676—40—79

He put on four more bullseyes after he had finished the score. The rest of the day the wind utterly prevented any accuracy in revolver shooting. Below are details of score:

	Stationary target, 20yds.	50yds.
E Howe	777776—41	665567—35
Walter Winans	777676—40	677667—39
Clementi-Smith	764757—36	.....
Capt T W Heath	655566—33	354664—29

The scores for the revolver championship of the club now stand as follows, Mr. Winans's scores standing first, as he has the best scores to add to them in case of a tie. Sept. 29 is the final shoot.

	20yds.	50yds
Walter Winans	41 41 40 40 40	39 33 37—316
Capt T W Heath	42 41 41 40 40	38 37 37—316
E Howe	41 41 41 40 40	37 37 36—313
C Knapp	40 39 39 39 38	36 35 35—301
Clementi-Smith	38 38 37 37 36	38 35 34—293
Malsinger	38 30 29 27 26	29 25 24—228
W B Reid	36 35 34 34 31	35 33 ..
Lieut J Howard	38 33 36 36 35	25 .. ..
Mrs Simmons	25 21 20 18 16	16 .. ..
A Wilson	35 33 33 29 ..	.. .. ..
C F Lowe	41	.. .. ..
F Rand	29	.. .. ..
A W Simmons	17	.. .. ..

On Sept. 23 a gale of wind was blowing, and the North London Rifle Club's revolver competition in consequence did not give any scores worth anything.

Fifty-yard target:

C Knapp	047777—32	Holmes	337455—27
Capt T W Heath	654465—30	Britton	054445—22
Capt Evans	746464—31	T H Howe	202244—14
Tilbury	463546—28	Lieut Curley	534232—19

Scores for revolver championship of the club now stand:

	Series 1.	Series 2.	Series 3.	Series 4	Total.
Walter Winans	42 41 41 40 40 40	38	39	37 36	—394
A W Carter	40 38 38 36 36 36	31	35	34 34	—363
C Knapp	39 37 37 36 36 34	39	31	33 33	—355
Holmes	38 37 36 35 33 30	38	34	34 33	—348
Lieut Howard	41 38 38 38 36 34	36	24	34 29	—348
Capt W Evans	38 36 36 36 35 34	32	29	33 31	—347
W Luff	37 37 36 35 35 34	38	30	31 31	—344
Maj H Palmer	41 40 39 38 37 ..	..	..	.. ..	

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

Oct. 23-24.—MARION, N. J.—Merchandise shoot of the Endeavor Gun Club. Targets. Entries in 100-target handicaps close Oct. 22, to A. R. Strader, 371 New York avenue, Jersey City, N. J., or to Carl von Lengerke, 8 Murray street, New York city. Entries to be accompanied by $2 forfeit.

Oct. 26-27.—LIBERTY, Ind.—Tournament of the Red Owl Gun Club. Live birds and targets. R. A. Creek, Sec'y.

Oct. 27-28.—ELIZABETH, N. J.—Eighth bi-monthly tournament of the Elizabeth Gun Club. First day, targets; second day, live birds.

Oct. 28-29.—IRONTON, O.—Third annual tournament of the Iron City Gun Club. Targets.

Oct. 29.—MACON, Ga.—All-day shoot at live birds, under the auspices of the Macon Gun Club. F. C. Etheridge, Sec'y.

Oct. 29-30.—DEXTER PARK, L. I.—Tournament under the auspices of the Emerald Gun Club, of New York. First day, targets; second day, live birds.

Nov. 7.—HACKENSACK, N. J.—Cup contest, under the auspices of the Bergen County Gun Club. C. O. Gardiner, Sec'y.

Dec. 1-3.—TRENTON, N. J.—Proposed contest for live-bird championship; 100 live birds per man, $100 entry. Under the management of Charles Zwirlein.

1897.

Jan. 4-5.—PRESCOTT, Arizona.—Fourth annual tournament of the Arizona State Sportsmen's Association, under the auspices of the Prescott Gun Club. Roy Hill, Sec'y.

January.—SAN ANTONIO, Tex.—Second midwinter tournament, under the management of Oscar Guessaz, etc.

March 23-25.—NEW YORK CITY.—The Interstate Association's fifth annual Grand American Handicap at live birds.

April 15-17.—SAN ANTONIO, Tex.—Tournament of the San Antonio Gun Club. Open to amateurs only. Willard T. Simpson, Chairman Ex. Com.

May 11-14.—OIL CITY, Pa.—Seventh annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. Targets and live birds. Black powder barred. Special event: 25 live birds per man, $25, $1,000 guaranteed. Send entries to H. C. Reeser, Sec'y Oil City, Pa.

June (third week).—CLEVELAND, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

The Endeavor Gun Club, of Jersey City, N. J., has issued the following circular in regard to its two days' shoot, Friday and Saturday, Oct. 23-24: "We, the Endeavor Gun Club, of Jersey City, N. J., herewith beg to notify you that we are about to give a two days' shoot for merchandise prizes, for the benefit of amateurs. We fully appreciate the desire for a shoot of this kind, and have therefore set about to obtain prizes for this occasion, and our success has been far beyond our anticipations. Among the many prizes received up to date (Oct. 1) are two handsome silver cups, a repeating shotgun, a pearl scarf pin, a case of wine, bicycle tires, paintings, carving sets, hunting shoes, shooting jackets, clothing, and other valuable prizes too numerous to mention here. The main event each day will be a 100-bluerock handicap shoot, in which every amateur trap-shooter will have an equal chance to win a prize. The entrance fee for these events will be the cost of targets only. If you are a 50 per cent. man you will be allowed to shoot at enough extra targets to put you on an equal basis with the best man in your club; thus we will give you a chance to win as good a prize as your neighbor. Besides the 100-bird event, two extra events of smaller size will be shot, in all of which we offer nice and suitable prizes for sportsmen. Our programme, which will give a full list of prizes, will be ready about Oct. 15, and can be had for the asking. Entries for the 100-bird event must be in by Oct. 22, and shooters must be on the grounds ready to shoot at 12:30 each day or forfeit their right to shoot. We will also give prizes each day to the club sending in the largest number of entries for the event. Remember that all this shooting will mean an outlay to you only for the price of targets at 2 cents each. Remember the dates, Friday, Oct. 23, and Saturday, Oct. 24, at Marion, N. J."

It is hard luck to lose a good story. Good stories are hard enough to get anyhow, and it's tough to have to give one up. Harry P. Fessenden, one of the shooting stars of the Emerald Gun Club, of New York, has just returned from a camping trip with one of the best moose stories we have ever heard. We had written that story up in our best style, making up by elegance of diction for the loss of action with which the story is replete when told by the hero. The story, however, will never see light in these columns now—but it's not our fault. The following postal card is the cause for its consignment to oblivion and the waste basket: "NEW YORK, Oct. 15.—*Editor Forest and Stream:* Dear Sir—Mr. Ed. Banks has some information in regard to a moose hunt I had in ——. Please instruct him to publish *nothing about it*, and oblige H. P. FESSENDEN." Such is fate, and posterity, as well as ourselves, suffers.

The Endeavor Gun Club, of Marion, N. J., and the East Side Gun Club, of Newark, N. J., have arranged a series of the best two in three matches at live birds. The conditions of the races are 15 birds per man, 6 men to a team, 28yds. rise, 50yds. boundary, A. S. A. rules to govern except as to boundary, losing team to pay for the birds. These matches were the outcome of an informal meeting that took place after the team race at targets between the two clubs, which was shot on the East Side Club's grounds Thursday afternoon, Oct. 15. Capt. Piercy, of the Endeavors, won the toss for choice of grounds for the first shoot; as a result the first match will be shot on the Marion grounds, the probable date being Thursday, Nov. 19.

The Austin Powder Co., through its agent, J. L. Winston, has donated to the Endeavor Gun Club, of Jersey City, N. J., a cup to be competed for on Nov. 3 on the grounds of that club. The shoot is to take place at 1 P M., the conditions being 50 targets per man, expert rule. The winner of the cup is liable to challenge every thirty days, but the cup finally becomes the absolute property of any one successfully defending his title to the cup for a period of six consecutive months. The entrance fee for the above 50-target race is only $5, which sum includes the price of the targets and shells to be used in the shoot. The "147" load must be used by all contestants.

Mr. C. J. De Roo, secretary of the Holland (Mich.) Gun Club, sends us the following item of news: "The Holland Gun Club, of Holland, Mich., has accepted a challenge from the Valley City Gun Club, of Grand Rapids, Mich., to shoot for State team championship and *Shooting and Fishing* silver trophy on Friday, Oct. 30, 10 A. M., at the Holland Gun Club grounds. A programme has been arranged for sweepstake shooting to come off after the main event, and shooting men are invited to take part."

FOREST AND STREAM has always advocated team races between local clubs. Such meetings are of the utmost benefit, not only in keeping up the enthusiasm of club members in trap-shooting, but they also do much good by bringing together men who would otherwise probably never meet, but who, having a mutual bond in their love of the gun, form friendships that outlast the days when they "break 'em all."

The new club house and grounds of the Herron Hill Gun Club, of Pittsburg, Pa., have proved an entire success. A large sum of money has been laid out on them, but every penny is stated to have been well spent, while all of the appointments are of the very highest order. The members find no trouble now in being able to shoot a live-bird match on the shortest notice, while the target shooting members have also been well looked after.

Five tournaments are scheduled for next week: Oct 26-27, Red Owl Gun Club, of Liberty, Ind.; Oct. 27-28, Elizabeth, N. J., Gun Club's eighth bi monthly; Oct. 28-29, Iron City Gun Club's third annual, at Ironton, O.; Oct. 29, Macon, Ga., Gun Club's all-day shoot at live birds; Oct. 29-30, tournament at Dexter Park, L. I., under the auspices of the Emerald Gun Club, of New York city.

Charles Zwirlein, of Yardville, N. J., has been making some big improvements in his pigeon coops, having built them 30ft. longer, with a cage of wire netting, in which the birds can take all the exercise necessary to keep them in good health and condition. He writes us that he has a lot of fine birds on hand, and only wants some one to come down and try them.

The Endeavor Gun Club, of Jersey City, N J., defeated the East Side Gun Club, of Newark, N. J, in the second team shoot between the two clubs, making the score 2 straight for the Endeavors. The conditions were 25 targets per man, known traps and angles, 6 men to a team. The Endeavors won by 14 breaks. The best scores made for the winning team were Collins and Edwards 24 each, Schortemeier 23

Preparations for Charlie Zwirlein's big live-bird shoot at the Interstate Fair Grounds, Trenton, N. J., Dec. 1-3, are progressing favorably. The large majority of those to whom letters have been sent asking them to take part in the shoot have not as yet had time to answer the questions put to them. Jim Elliott, who has left for the West, stated positively that if the championship event was a go he would come from Kansas City to take part in it.

It seems a hard matter to galvanize that slumbering organization the New Jersey State Association, into life. We have, however, better hopes now of seeing New Jersey once more in line. A meeting will be called at Taylor's Hotel, Jersey City, in the near future, at which a solid movement will be made with a view to holding a State shoot in Jersey under the auspices of a State organization.

The Endeavor Gun Club's merchandise shoot on Friday and Saturday of this week should be well attended. Experts are to be heavily handicapped, which means that the weaker brethren will have every chance to win a good prize on a small investment. It is worth $2 anyhow to see how many targets you can break out of four 25-target events.

In regard to a Driver and Twister that appeared in last week's issue Paul North writes us as follows: "If anybody mistook you for the writer, or got the writer mixed up with Jack Robbins, we do not see any necessity for heralding the fact broadcast throughout the trap-shooting fraternity. The writer has some little reputation left, and wishes to have it carefully guarded. Any more breaks of this nature will be thoroughly revenged."

There will be a 25-bird race at the grounds of the Elizabeth (N. J.) Gun Club on Wednesday, Oct. 21, the second day of the club's bi-monthly shoot. The conditions are: 25 live birds, $10, birds extra, handicap rise. Under 12 entries, 2 moneys; over 12 entries, 4 moneys.

Oct. 20. EDWARD BANKS.

In New Jersey.

AT THE ELKWOOD PARK TRAPS.

Oct. 10.—There was some good shooting to-day at the traps in Elkwood Park. Fred Hoey was in great form, and shot more like his old self than he has done in many moons. The wind, which was blowing strongly from the east, made things unpleasant for the shooters, and in a measure assisted many birds to get away. The most important event on the programme was the Little Silver handicap. The conditions were 15 birds per man, $15 entrance, handicap rise, Elkwood Park boundary, high guns. This event resulted in Hoey and Al Ivins tieing for first and second moneys with 14 kills each. Winston was third with 13 kills. The scores were:

Hoey (30).....222212222202222—14 Daly (30).....222211202222200—12
Ivins (30).....122021122221222—14 Patten (28).....222012201222022—12
Winston (30)....220222222222220—13 Woolley (27)....121222020202022—11

The second event was 5 birds, $5. The money went to Hoey and Winston on 5 kills each. The scores were: Hoey and Winston 5, Phil Daly, Jr., 4, Ivins and Woolley 3, Daly and Patten 2.

Charles Woolley, who is a member of the Central Gun Club, of Long Branch, won the third event, a $5 miss-and-out, with 3 straight kills. The other scores were: Daly and Patten 2, Hoey, Winston and Ivins 1 each.

Woolley was also to the fore in the next event, same conditions as No. 3. Scores: Wooley and Daly 7, Hoey and Patten 6, Ivins 3.

Event No. 5 was at 10 birds, $10 handicap rise. As in the Little Silver Handicap, Hoey and Ivins took first and second moneys, but this time they had 10 straight kills to their credit. Scores:

Hoey (30).....1222212222—10 Woolley (28).....2122221220— 9
Ivins (30).....2112221122—10 Patten (28).....0110102022— 6
Daly (30).....2002220112— 9

The sixth event was another miss-and-out, $5 entrance. It was not a long contest, Hoey and Daly dividing the pot on the second round. Scores: Hoey and Daly 2, Patten, Woolley and Ivins 1.

CLIMAX GUN CLUB, OF PLAINFIELD.

Oct. 14.—The attendance at the regular monthly shoot of the Climax Gun Club, of Plainfield, held this afternoon, was very small. Those who put in an appearance did some good shooting, as the following scores will testify.

Club shoot, 25 targets, unknown angles, extra targets as handicaps:

M Herrington (3).....1111111011111111111101011111 —25
J Goodman (7).....1101101100111111111111111110110—25
T Brantingham (0).....0111111011111111111111111 —23
R Manning (1).....1111011111111111111110110111 —23
Scott (3).....0110111111110111111111001110 —22
J Darby (7).....1011000110011011010101010101000110—17

RIVERTON GUN CLUB.

Oct. 17.—The two days' shoot of the Riverton Gun Club, of Philadelphia, Pa., was held on the grounds of the club at Riverton, N. J. There was an excellent programme of events, the attendance of shooters being proportionately good. On Friday, Oct. 16, the first day of the shoot, the number of spectators present was proof of the interest taken in the shoot. To-day, Oct. 17, the attendance of spectators was very large. The birds provided by the club were of extra good quality, many being as good as ever left a trap.

First Day, Oct. 16.

The 25-bird handicap resulted in a division of first and second moneys between J. H. Davis (30) and H. Yale Dolan (29) with 24 each. Four men tied for third money on 23. The shoot-off, at 8 birds, then miss-and-out, ended in a division between Count and Macalester. The conditions of the race were:

Twenty-five live birds per man, $25, handicap rise, ties to be shot off at 8 birds, then miss-and-out; cup and 50 per cent. of the purse to the winner; 25 per cent. to second; 15 per cent. to third, and 10 per cent. to the club. Half the birds to be shot at on the "old grounds," balance on the "new grounds."

		Tie for third money.
J H Davis (30)	2221112212221212011121112—24	.....

Hoey (29)	0222022202021210w —11	.....

The 10-bird race resulted in five ties for the three moneys. Ties had to be shot off at 5 birds, then miss-and-out; Barker and Upson divided first and second at the end of the fifth round; Work took third money. The conditions were:

Ten live birds per man, $10 entrance, handicap rise; cup and 50 per cent. of purse to winner. 25 per cent. to second, 15 per cent. to third, and 10 per cent. to the club:

		Ties.

Hoey (29)	200 — 1	.....	.....

Second Day, Oct. 17.

This was the day set for the 50-bird race. In some respects it was a poor day for live-bird shooting, a strong wind blowing right in the face of the man at the score, and consequently all against outgoing birds. Half the match was shot on the "old grounds," the other half on the "new grounds." First money went to T. S. Stokes with 47 out of 50; Macalester lost his 50th bird, a left-quartering incomer, dead just out of bounds over the wire. Conditions:

Fifty live birds per man, $50 entrance, handicap rise. Cup and 50 per cent. of entrance moneys to the winner, 25 per cent. to second, 15 per cent. to third, and 10 per cent. to the club:

T D Stokes (29)	121210222•2212222222122222—23

NEW JERSEY AMATEUR TRAP-SHOOTERS' LEAGUE.

Oct. 17.—The fifth shoot of the New Jersey Amateur Trap-Shooters' League was held on the grounds of the Oritani Field Club this afternoon. Each club composing the League was represented by a team of six men in the team race, the members of the teams making a goodly muster of shooters on the grounds. Those present had all the shooting they wanted, the management of the shooting department of the Oritani Field Club having placed an extra set of traps in position in order to give their guests all the chance possible to fire as many cartridges as they brought with them. As a result, very few carried any cartridges away with them.

The weather was unfavorable, being dull and threatening rain all the afternoon. The traps did not work as well as usual, and this combined with the bad light made shooting hard and straights scarce.

The team race resulted in a close finish, the Boiling Springs Gun Club, of Rutherford, coming in first from scratch with 140 breaks out of 180 shot at. The Endeavor Gun Club, of Jersey City, also a scratch team, tied for second place with the team of the Bergen County Gun Club, of Hackensack, the members of the latter team shooting at 3 extra targets per man; both clubs scored 138 breaks.

The teams were split up, squads being made up with men from different teams. Each squad shot first at 15 targets, known traps and angles. After every man had shot at this 15 targets the squads were called up in rotation to shoot at 15 targets, unknown angles, the handicap allowances being also shot off at unknown angles. It will thus be seen that the final result was in doubt until the last shots had been fired. The optional sweep gotten up in connection with the team race was divided as follows: Schortemeier first money with 29 out of 30, Edwards second with 28, Gus Greiff and C. R. Wise third with 26 each. The optional sweep only went on the first 30 targets, handicap allowances not being counted.

[Contrary to custom, and to our expectations, we have received no copy of either the scores in the team race or in the sweeps up to the time of going to press.]

On Long Island.

NEW UTRECHT GUN CLUB.

Oct. 17.—Only four members of the New Utrecht Gun Club turned up at Woodlawn to-day, but they had a treat. The 174 birds used were the finest lot I have seen trapped in some time, being quick to start and lightning when on the wing. President Furgueson was called away on account of sickness at home in the 4th round of first miss-and-out. Dr. Littlefield and J. E. Jones kept shooting until their shells gave out. Scores:

Club Shoot.		Ties.
C Furgueson, Jr (A, 30)	1222222221—10	.....
Dr Littlefield (A, 28)	1001•21212— 7	.....
J E Jones (B, 29)	2120202122— 8	22222•—5
Conny Furgueson (B, 27)	220221122•— 8	222222—6

Two team races were shot as follows:

	No. 1.	No 2.
C Furgueson, Jr	22220222•w—7	22122—5
Conny Furgueson	102022021w—6—13	1•212—4—9
J E Jones	21222222• —8	2220•—3
Dr Littlefield	22•223222 —8—16	22220—4—7

Miss-and outs, $2 entrance:

	No. 1.	No. 2.	No. 3.	No. 4.
C Furgueson, Jr	2122			
J E Jones	2210	0	20	2122222210212
Dr. Littlefield	2221	2	22	1122222220110

In a match, 5 birds, L. I. rules, 30yds. rise, Dr. Littlefield won by scoring 2 out of 4; his opponent, Jones, losing 4 out of 5.

G. E. Pool, Sec'y.

Position of the Gun vs. Sportsmanship.

Paterson, N. J., Oct. 16.—*Editor Forest and Stream:* I am a constant reader of your paper, and I, like many of my fellow townsmen and brother sportsmen, have been very much impressed for some time past by the way in which things pertaining to sport in general and trap-shooting in particular are taken up and discussed in your columns.

Hardly a week passes but some fresh subject of interest to shooters is noticed, and week by week I find myself opening my Forest and Stream and glancing through to see what new matter it has brought forward.

In your issue of Oct. 10 there is a most interesting letter from "48-grains" which contains a great deal more than 48grs. of common sense. I am a trap-shooter myself, as well as a game shot, and I can thoroughly indorse all that "48-grains" says. The advocates of "gun below the elbow" forget that this was originally the position with all trap-shooters. The change of position came as an improvement on the old, and for good reasons. It must be remembered that trap-shooting is of English origin.

The old rule calling for use of one barrel and gun below the elbow also placed the shooter at 25yds. from the trap only. At that time but one trap was used, or if more than one, the shooter knew which trap he was going to have pulled. The change was then made to using five traps, 5yds. apart, and the shooter not to know which trap he was going to get. The use of both barrels was allowed, and the usual distance for the shooter to stand at from the center trap was 30yds. These changes were made chiefly for the following reasons:

First, to stop cheating, which had in some cases become very common under the old rule. Second, to more nearly assimilate the conditions to those of shooting in the field, where the use of both barrels is allowed, and when you do not usually know exactly from what point a bird will spring. Third, to make the shooting more varied and less mechanical, for it has been found that any man who practiced the one barrel and gun below the elbow position could beat the game shot, if the latter faced the traps, far more than can be done when holding the gun as at present and using both barrels.

The change was first made to "gun below the shoulder," and for many years that was the position used at all the best clubs, but it was found that even that position was open to the same old objections, *viz:* That it was almost impossible for a referee to say exactly whether the gun was being held properly or not at the moment of firing, especially if a man was shooting in a loose-fitting coat, as then the butt of the gun could scarcely be seen by the referee unless he stood in front of the shooter, which was out of the question.

Also a field shot or a new pigeon shot was kept thinking whether he had got his gun right or not, and did not in consequence do himself justice. Then, too, an appeal would sometimes be made to a referee as to the way in which the gun was being held, simply in order to distract or worry the shooter. For these and several good and sufficient reasons the man who had the control of pigeon shooting on such grounds as the *Cercle des Patineurs*, at Paris; Monte Carlo; the Gun Club, Notting Hill; and at Hurlingham, decided to allow a man to hold his gun in any position he chose, as can be done in the field.

The advocates for going back to the old rule, I find, are generally under the impression that a man who has practiced the position which so many men use of gluing the gun to the shoulder before and after the word "pull" is given, has an advantage over the man who does not do so.

In reply to this, I would say that the best amateur pigeon shots in this country, and I believe abroad as well, do not keep the gun up to shoulder, but throw it up on calling pull; this is certainly the case with George Work, Edgar Murphy, Fred Hoey, Chas. Macalester, Lou Thompson, Joe Knapp, Bobby Welsh, etc., etc., etc.

An Old-Timer.

Limited Gun Club's Tournament.

On Oct. 6-8, at Indianapolis, Ind., the Limited Gun Club gave one of its mammoth tournaments. Those who failed to attend lost a treat, for nowhere can one have a more enjoyable time than at the said grounds.

Frequent reference has been made to the manner of trapping the targets here, so that any further mention is not necessary. Suffice it to say that every newcomer at once falls into the style and admires it correspondingly.

I reached the grounds on the day before the opening one, and on looking about found the pilot and mainstay of the club away down in one of the pits busily engaged fixing up the traps and pulls. Any one who has been to these grounds knows very well of whom I speak, but for the benefit of those who have the misfortune of not having been there I will state that the man is Royal Robinson, and that's enough, for no one can go to those grounds and come away without having under his vest a very warm side for that gentleman.

Owing to a pretty stiff breeze on all of the first day the scores are not as high as one generally sees on these grounds, and then again the reverse pull system is hard to catch on to, as many aspirants have found out. The scores therefore of Messrs. Rattle, McDonald, McVey and Clark are really very good, while Mr. Robinson made a great effort in the Grand Hotel cup match when he tied Mr. Eblesisor.

To say that the sparrows were lively and artful on the third day does not in any sense cover the case. I have never seen sparrows trapped as well as in Indianapolis, and Mr. Hill, the purveyor, is certainly an adept as well in catching as in trapping these little chaps. By an ingenious method he places 15 traps in a line, so that 5 men are called up at a time, each one facing three traps, 2½yds. apart. This system allows the shooting to go on much faster, as the 15 traps are loaded by five boys all at one time and one shoots in squads as in target shooting. Some great shooting was done here, notably by Messrs. Chadwick, McDonald and McVey, who centered the little rascals "coming and going" and every other way.

It is a real pity that the shooting of sparrows is not more universal, as it affords great and difficult sport, and actually teaches a man something that afield may benefit him in the handling of his gun. The man who can score 90 per cent. on Hill's sparrows from three unknown traps, 25yds. rise, is a very good shot indeed, especially on a windy day and in the autumn, when the color of the grass and that of the birds blend so well together.

In the first few rounds the pigeons were slow to start and offered very easy marks; later on they improved, and good shooting was had. In this nine traps were used, 2½yds. apart, 30yds. rise, traps pulled all at once. One man up in the middle, unknown traps, 5 birds to the round; hence in the 10-bird event one went to the score twice and in the 15 three times. There being nine traps even after firing the fifth shot, there were still four traps full; so it was just as much unknown traps as from any other way of shooting. To avoid the bird's suffering when one was shot, but not killed outright, it was dispatched by some one detailed for that purpose, while all doubtful birds were instantly gathered before being scored.

Mr. McDonald went out in flying colors, having scored his 25 straight, followed closely by Chadwick with 24, and Lyons and Voris with 23. The pigeons in the 15-bird event proved good, strong flyers, and Messrs. McDonald and Chadwick deserve special mention for their good work, both men making brilliant kills.

Should the Limited Gun Club, with its convenient, cozy club house and beautiful grounds, give during the winter a live-bird tournament, it would doubtless be a most attractive affair, as very few places could offer as many advantages, both as to location and arrangement of the grounds. I hope that such may be done in the near future, as certainly no club is deserving of better patronage, nor can any offer such comforts or advantages.

The scores made in the three days of the tournament follow:

First Day, Oct. 6.

CLASS A.

Events:	1	2	3	4	5	6	7	8	9		
Targets:	*15*	*15*	*20*	*15*	*20*	*15*	*15*	*20*	*15*	Shot at.	Broke.
McVey	14	13	17	11	15	11	11	17	11	150	120
Partington	13	12	18	9	..	9	10	..	..	95	71

Gaucho.

The Oil City Gun Club, of Oil City, Pa., under whose auspices the seventh annual tournament of the Pennsylvania State Sportsmen's Association will be held, is early in the field with the following announcement: "May 11-14, 1897.—Oil City, Pa.—Seventh annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. Targets and live birds. Black powder barred. Special event: 25 live birds, $25 entrance, $1,000 guaranteed. Send entries with $10 to H. C. Reeser, secretary, Oil City, Pa." The above announcement does not state whether the special event is to be handicap or not. We are also left in doubt as to what day of the shoot the above event will be started.

Programmes and Tournaments.

In the course of a year FOREST AND STREAM receives some 250 to 300 programmes of tournaments for trap-shooters. As a matter of course, and in accordance with the old proverb of "Many men, many minds," there is a great variety of styles in these programmes. We are not speaking of typographical or artistic styles; with them we have nothing whatever do, and outside of some little benefit to advertisers in those programmes it really matters very little how the programmes are gotten out. A neat little book or pamphlet, good paper, clean and artistic presswork—such things go a long way toward making a programme attractive, and therefore of more intrinsic value to advertisers who have paid so much a page for a notice in the programme. What we are about to deal with is the variety of styles in the composition of a programme.

When a club first decides on holding a tournament it generally appoints a tournament committee whose duty it is to carry that club safely through the quicksands and shallows of a shoot, much as a pilot is taken aboard an ocean steamer for the purpose of bringing it safely into port. If the ship is wrecked, the pilot is blamed; and in like manner, if the tournament is a failure, the tournament committee is given fits by the balance of its fellow-members. There is a saving clause in both instances: If the elements—an act of God, as it were—are the cause of the wreck or failure, mitigating circumstances may be pleaded.

TOURNAMENT COMMITTEES APPOINTED WITH CARE.

Gun clubs, as a rule, recognize the importance of the duties of the tournament committee, and the chairman of the meeting at which a motion is made to appoint a tournament committee is careful to appoint only such men as are well known to be in sympathy with the movement and full of enthusiasm for the good cause. Gun clubs, like kindred organizations, are unfortunately too often the victims of cliques. In such cases the appointment of a tournament committee is a ticklish matter, and the chairman of that committee should be a man of tact—one capable of handling the body of men he is chosen to control. The size of the committee depends largely on the size of the club, and the tournament it contemplates holding. As a rule a committee of from three to five members is large enough, but we would suggest the latter number in all cases wherever possible. Three make a quorum to five, and such a number is almost always easy to get together.

We will suppose that a committee has been appointed "to report on the advisablity of holding a tournament at the next regular meeting" of the club. The duties of each member of this committee would be to see personally all the members of the club he can call on or meet and ascertain their views on the point; then get together, compare notes and prepare a report. If it is favorable and is adopted, a motion would be in order, under the head of new business, to appoint a committee to carry out the views of the above committee. This would be a "tournament committee."

CONFLICTING DATES.

When deciding upon dates for your tournament, scan carefully the list of forthcoming events in our Fixtures column and avoid all possible chance of a conflict of dates. Claim your dates well ahead; be first in the field and thus, by courtesy, obtain a prescriptive right to those dates.

During the past twelve months we have had more than one instance of the unfortunate results attached to a conflict of dates. Of course, it is perfectly right and proper that two gun clubs, with 1,000 or 1,500 miles between them, should hold shoots on the same dates. Such tournaments would not affect the attendance at either the one or the other; that is, not to a serious extent, unless one of them happened to be one of the large tournaments on "the circuit."

The months of May and June are favorites with promoters of tournaments. While there is always a danger of conflicting dates in any month of the year, there is far more danger of such a mishap occurring during those two months than in the whole of the other ten. Our advice is: Watch the Fixtures column closely and avoid trouble.

Passing over for the present all the other duties of this tournament committee, such as arrangements for holding the shoot, the soliciting of advertisements to pay for the cost of printing the programme, etc., we will now deal with the most important duty of all—the composition of the programme.

A CHANCE TO GET EVEN.

The old days, when it was only necessary to state in FOREST AND STREAM that such and such a club was going to hold a shoot in order to get a crowd of shooters together, have gone by. The boys get a lot of shooting nowadays, and are very chary of going far away from home to meet others in front of the traps. Gun clubs were scarce then; they are numberless now, and all of them hold weekly or fortnightly shoots which afford lots of sport. Times were good then; they are hard now, and the boys have to stick to business very close, with but few five-dollar bills to throw away without a chance to get even. That's the point: The chance to get even! To draw a good attendance at any shoot you must give the boys a chance to get even. The outlay of a man who is not paid to attend tournaments is considerable, even before he gets his gun out of its case and fires a shot. First there is his railroad fare; he should always get a return ticket, so that he may be sure he won't have to walk home. Next, there is his hotel bill and other daily expenses, which cannot be figured at less than $3 per day, or say $10 for a three-days' shoot. His shells are a big item; he will require 600 or 700 for a shoot of this size. At $2 per 100, a low figure, there's $12 to $14 gone again. If the programme calls for 175 or 200 targets, he must put aside from $17.50 to $20 more for each day. Taking the lowest estimate in each case, and figuring his railroad fare at $10, we have an outlay of $84.50. To get even he figures that he must draw out of the purses at least $30 per day to cover contingencies. Unless he shoots an abnormal gait (that is, for him), say over 90 per cent. each day, he cannot hope to do it unless there is a substantial sum of added money to shoot for. The consequence is that when there is no such sum of added money offered he stays away, and lots more do the same, with the result that the tournament is a practical failure.

THE OBJECT OF THE TOURNAMENT.

Another point for a tournament committee to consider is the object for which the tournament is being promoted. We hold that no tournament should be given with a view to making money for the club. Individuals, as a matter of speculation, can do such things; but we are of the opinion that it would be worse than *infra dig* for a club to attempt to do it. For a gun club to go to work, get up a programme, invite shooters to their grounds, talk about giving them a good time and lots of shooting—in fact, jolly them along, with the ultimate view of making money out of them—would be something more than an error of judgment; at least, that's our way of looking at it. As we said before, "Many men, many minds," or, as the French trap-shooter would say, "*Chacun a son gout.*"

A club run on economic principles, with weekly or fortnightly shoots bringing in a steady revenue, added to the yearly dues, ought to be sufficient income to carry a club along from year to year, make all necessary repairs and renew stock, etc. Cut loose from all ideas of making money out of your tournaments, and you will then stand a good show of taking rank among the best clubs in the country. The shooters who have been your guests will go away with the knowledge that they have not been up against a brace game, and you will have little trouble in the future in getting them to came again. There is also a certain pleasure in acting host that is yours, but remember it always costs money to act the part of a host when business interests are attached to it.

THREE CLASSES OF TOURNAMENTS.

That brings us to the next point. The size and wealth of a club will have a good deal of weight in deciding the question as to what sort of a tournament shall be given. There are really three classes of tournaments: the "open-to-all, no handicap," the "amateurs only" and the "open-to-all, experts handicapped." The inducements held out to draw a good attendance of shooters at tournaments of the first and of the last class should be on the same lines. Tournaments for amateurs only are hard things to handle, and few men have the capacity for carrying such shoots to a successful termination.

Of the first class of tournaments we can recall many instances of really successful shoots: Knoxville, the inaugurator of large added money shoots; Memphis, the E. C. tournament at Guttenberg, the Du Pont shoot at Cincinnati, the midwinter shoot of the Big Three at San Antonio and a host of others. At all of these a big amount of added money was hung up; the boys thought they saw a soft thing and went to these shoots time after time; there was a chance to get even. A few got big money, some got even; but the large majority got it in the neck! Yet they'd go there again—every time. They know very well that everybody cannot win, but they are willing to take chances of being among the chosen few. If no big amount of added money had been offered at such shoots, the attendance would have dwindled down to the usual "three squads, more or less."

BIG MONEY—BIG SHOOT.

If you want to hold a big shoot, therefore, don't run away with the impression that it is only necessary to advertise your shoot in the columns of the sporting papers, announcing a moderate sum of added money. Tournament shooting on a large scale is a business as well as a sport, and you must handle it in a business-like manner if you wish success. Tournaments for sport only are touched on later.

If a tournament has ever been held where a large amount of added money was announced, that was not a success in point of attendance, we have yet to hear of it. Whether such tournaments do as much good to the cause of trap-shooting as smaller ones do is another matter altogether outside the question, and cannot be discussed here. The fact remains that if you hang up solid inducements you'll get the boys to come and shoot. They'll come a long way too. You remember the old story about the way the vulture drops apparently out of the skies when a head of stock dies? That's its meat! Well, it's much the same thing with a good purse of added money and trap-shooters, only the division of the spoils is not so equitable in the latter case as in the former.

Tournaments of the third class, "open-to-all, experts handicapped," really require more thought and care in preparation than the simple "open-to-all, no handicap." The Hazard tournament at Cincinnati and Paul North's tournaments at Cleveland belong to this class. At the Hazard tournament held last May shooters were divided into two classes, experts and amateurs. The former class was composed of shooters who had made a record of 85 per cent. or better in a tournament; these men shot at unknown angles from known traps. "Amateurs" were those who had never made a record of 85 per cent. or better in a tournament; these shot at known traps and angles. At Cleveland this year Paul North introduced a new handicap, one devised by Judge Lindsay, of Knoxville, Tenn. This was the scheme, shooters classifying themselves: In the first event each day everybody paid in $3; winners of first money in this event paid $4 as entrance money in the next event they shot in; winners of second money paid $3.50; winners of third paid $3; winners or fourth paid $2.50; winners of fifth and all who had not made a place in the event, $2. This handicap was a sliding one, shooters classifying themselves in each event according to their shooting in the previous race. The handicap is a good one, but is somewhat complicated for rapid work in a cashier's office, until the cashier becomes thoroughly acquainted with the system.

The above are two methods of handicapping that have been adopted at recent large tournaments. At both shoots there were solid monetary inducements to attract the boys. At Cincinnati the Hazard Powder Co. added $2,000 in cash to the purses; at Cleveland Paul North (the Chamberlin Co.) threw all bluerocks free of charge, practically an addition of $600 to the purses if 20,000 targets were thrown during the three days of the shoot. A sum of $770 was also added to the purses.

From the above figures it will be seen that neither R. S. Waddell, of the Hazard Powder Co., nor Paul North, of the Chamberlin Co., were of the opinion that a crowd of shooters could be gathered together without adding money to the purses; in other words, they realized that a handicap alone would not make a shoot

If, then, you want to hold a big tournament, you must add cash to the purses, remembering that the attendance will be in exact proportion to the amount of added money.

RAISING ADDED MONEY.

There are different ways of raising added money. First to be considered is the sum that may be obtained from the sale of targets. This of course will vary, but if you decide to add $1,000 in cash and to run two sets of traps, 30,000 targets for a three days' shoot would be a very moderate estimate, especially if you take into account the 2,500 to 3,000 targets that should be thrown on "preparation day." At 3 cents each the 30,000 targets would bring in $900; of that sum $350 or $400 should be taken as cost of targets and expenses of the shoot. This would leave fully $500 for added money. You will then have to consider the raising of the additional $500. It is customary to figure on "making" a good sum out of the advertising in programmes. We don't like that idea at all, and have heard many manufacturers and dealers of sporting goods speak of it in unfavorable terms. Several firms, however, put aside a certain sum of money every year to be expended in "taking a page" in programmes of large shoots, and as long as this is done we suppose that the advertisements in programmes will be looked upon as a source of revenue Many programmes that we have received this year have undoubtedly been the source of much profit to the clubs that issued them. We know of one that netted $350 as per the report of the tournament committee. This programme, however, was the result of energetic work on the part of the sub-committee appointed to solicit advertising, the efforts of the sub-committee being most generously met by the different members of the club that had anything that could be advertised. In other words, many of the members of the club opened their purse strings and donated so much to the fund for added money. Advertisements in programmes of tournaments calling attention to certain brands of powder, shells, different makes of guns, etc., probably do bring a return to the advertiser; we believe that in a measure this is unquestionably so. It is also to the interest of sporting goods dealers and manufacturers to foster trap-shooting tournaments, and on that ground alone the soliciting of advertisements for programmes may be excused. Still it does look as if the request for an advertisement was somewhat after the order of a request for a rake off on the profit of shells, powders, etc., consumed at this shoot.

Suppose that you decide not to solicit any advertising, desiring to get out a plain programme that will just tell the facts and call attention to the "$1,000 added." The club's exchequer should be good for something and could be counted in; remember "it's the club's treat!" A canvass of the club members should also result in the addition of many $5 bills to go into the added money fund. Certain parties who will be directly interested in the coming of the visitors will no doubt subscribe to this "entertainment fund" more liberally than others who have only the welfare of the club and the success of the shoot at heart. Add the $500 calculated to be raised from the price of the targets to the amounts from the club's exchequer and the members' subscriptions. If this does not amount to $1,000, secure the raising of the balance required by "guarantors"; that is, ask any members of the club who may be willing to do it to "guarantee to pay a proportionate sum of the balance of the $1,000 added money not raised by the sale of targets and the funds above mentioned." If $1,000 is added to the purses in any shoot, there'll be little, if anything, for the guarantors to make good; the 30,000 targets would be increased by some thousands if that amount of money is offered.

The above would be the method of raising added money that we should suggest to a club asking information on that subject. We don't expect that many people will agree with us on this point, as it is a hard matter to break away from all old ties. We do think, however, that thousands of trap-shooters will agree with us that visiting shooters should be treated as guests, not as breadwinners for the benefit of the home club.

THE 3-CENT TARGET A STUMBLING BLOCK.

The 3-cents-a-target will probably be a stumbling block to some of our critics They will say possibly: "If you treat visiting shooters as guests, why rob them of nearly 2 cents more than it costs to trap and buy the targets?" Gentlemen, this is no robbery; every shooter who comes to such a tournament as above suggested knows that 3 cents a target will be deducted from the purses; the programme tells him so. He also knows that it will take every cent of profit derived from the sale of targets to make good the amount of added money. The charge of 3 cents a target may therefore be described as a compact between the club and its visitors.

It may be urged: "Why not charge 1½ cents per target and add no money?" Our answer is: "To a man who goes to shoot through a programme of 200 or 175 targets the extra charge of $1.50 or $1.25 per day for targets cuts no figure in comparison with the larger amount of added money offered in lieu of targets at half price."

So much for added money as a factor in securing a good attendance at shoots of the "open-to-all" kind. For an amateurs' shoot, experts barred, you will have to add money to draw a crowd; for, say what you will, the amateur is after the long green just as much as his more expert brother; the only trouble is that he doesn't get it so often or in such quantities.

EXPERTS OR AMATEURS.

Trap-shooters may be divided into two classes—experts and amateurs. Mr. Waddell's definition of the two classes is a good one: All who have a better average than 85 per cent. in any tournament are experts; the others are amateurs. Both classes contain men who are considered as professionals by many shooters, though to our mind men who can be rightly classed as professionals are found only in the expert class.

The most important duties to be performed by the tournament committee are the question of, and raising of, the amount of money (if any) to be added; and the sort of shoot to be given, whether open-to-all or not. Once these matters are fixed, the rest is comparatively easy work.

The style of shooting has to be determined. We believe in a varied programme of events at known traps and angles; at unknown angles; and at traps pulled in reversed order. Our idea in advocating a variety of styles is to do away with the monotony of pounding away at one style of shooting. Then again, known traps and angles lets all the boys in; many shooters who are not quick-sighted enough to make a good score on unknown angles can come to the front when a known angle event is started. We are well aware that many people will say at once: "I can't shoot known angles as well as I can unknown." Perhaps that is so in some cases, but we assert that nine out of ten men can make better, that is, higher scores at known traps and angles than at unknown angles, if they will only pay as strict attention to their shooting at one style as at the other. Known angles are more monotonous than unknown angles; one has to plug away all the time; once relax the tension and the fatal skip comes. Reversed order is good practice for crossing shots, while the start which the straightaways get from Nos. 2 and 4 traps makes a shooter learn to be quicker on that most deceptive of all targets, the straightaway. How often one hears it said after a man has broken a straightaway: "I could break 1,000 like that." How many shooters can break 100 straight, or 50, or even 25?

MAKE THE SHOOTING VARIED.

Our advice therefore is: Make the styles of shooting varied, and do away as far as possible with the reproach on target-shooting that it is so mechanical and monotonous. A good scheme is to run on a side set of traps a few extra events at expert rule and at pairs. We don't believe in incorporating such events in a programme where there is average money offered, as it is hard to get one's fellow members at practice shoots to do anything in this line. The styles of shooting are too hard for them; they don't make big enough scores at them, and they are slow, delaying the game; in fact, a fellow can't shoot often enough to please him if there are many of such events shot during the afternoon's practice.

The length of a programme is an important matter to consider, and much depends on the amount of added money and the number of sets of traps already decided upon. If a large entry is expected, that is, if a large amount of money is added to the purses, 160 to 175 targets is ample for a day's work. If there are more than 175 targets on the programme it would be fair to except the last affair from consideration in the matter of average money. This would be particularly so in tournaments held early or late in the season when the days are short; otherwise those who shot in squads No. 1 and No. 2 would have a great advantage over those who shot in the last squads, when the light would be manifestly poorer and the targets harder to locate than an hour previous.

AVERAGE MONEYS SHOULD BE "HIGH GUNS."

The mention of average money brings us to a most important feature, perhaps the most important feature in the whole programme, yet one that is too often overlooked. Average money for each day's shooting and average money for general averages bring the boys out early and keep them shooting. Daily averages we consider a wise provision because a good man may fall down one day and shut himself practically out of all chance for the general average moneys. If there are daily averages as well, he will go to bed and dream of straights without end, and be on deck early next morning, anxious to redeem himself and "get a place."

In apportioning average moneys be sure and always state plainly that they are for high guns. A division of average moneys on the old and inequitable system in use for class shooting prior to the advent of the Rose system should not be thought of. Under that system we should again have the anomaly of a man who had broken more targets than another receiving a less reward for doing so. Make the average moneys, therefore, high guns all the time.

"INFORMATION FOR SHOOTERS."

To make your programme complete the page of "Information for Shooters" should always include the following items: Where to ship guns and shells; how to reach the grounds; the headquarters for shooters—that is, the hotel for the boys to stop at where a special rate has been secured. A commercial rate, if nothing better, can always be secured for shooters, especially where the distance of the grounds from the hotel precludes the chance of going to the hotel for dinner or lunch.

If possible go to work and obtain a special rate over the railroads running into your town or city and state that fact in your programme. A matter like that has quite a bearing on the attendance at your shoot. It is just so much saved from the original outlay referred to above.

The secretary's name and address should always be given, in order that any inquiries in regard to further information that may be desired can be sent to him. This is perhaps a small matter, but like many others it helps to make a harmonious whole.

We have about disposed of the programme and can now turn to a few hints on the preparatory work for the tournament.

AMPLE ACCOMMODATION IS NECESSARY.

If the weather is likely to be warm you can scarcely have too much shade in the shape of tent flies, etc. If the tournament is to be held in weather that is doubtful take care to have plenty of warm shelter for the shooters. There is nothing more disagreeable than to have a crowd together into a small space where the air is bad, and where non-smokers have to swallow tobacco smoke second hand. Chilly hands and damp, cold feet make poor scores, and poor scores make the boys disgruntled and apt to kick. Shelter them well from heat, cold or wet, and they'll not forget you. Don't leave anything to chance, but cover your retreat, as it were. At the scores have a good solid platform, or something that is equally good, a well-beaten track, and shelter the shooters at the score from the rays of the sun or from the rain. The expense of these luxuries is not much, while the luxuries themselves mean a great deal to your guests.

OFFICIALS MUST BE CAPABLE.

Your referees should be men with good eyesight, a thorough knowledge of the shooting rules, and backbone enough so as to do away with all chance of their being "worked." Members of your own club, men who are fond of shooting, but who perhaps do not shoot well enough to attempt shooting through the programme, are the very best material you could select from which to choose your referees. Blackboards as well as manifold scores should be kept. Instruct your referees that "the blackboard goes all the time," and see that it does "go." Shooters can see their scores being chalked up on the blackboards, while no one except the manifold man himself knows what he is doing to the scores; he may be one or two men behind, and no one any the wiser. The positions of blackboard scorers and manifold men can be easily filled with suitable parties.

The trappers are a very important feature at all tournaments. We recommend the employment of men in the place of boys all the time; they cost a little more, it is true, but they soon pay for that extra cost by better work. It is a severe strain on a boy to set him to trapping targets for two or three days, and sooner or later boys become careless and full of the old Harry. They are harder than men to keep in order, and the balks that often result from their work are very trying to everybody's temper. Employ no trapper under nineteen or twenty years of age, and put each set of trappers in charge of a member of that set. Make him a kind of captain over the others, and make him responsible for the good behavior of his regiment. Premiums for good work at a tournament often go a long way toward insuring good and quick trapping.

The cashier's department should include the following staff: Cashier, assistant cashier and entry clerk, and a squad hustler. A good manager knows that one of the secrets of success in running a tournament is to have the cashier's office in the hands of capable men. A "ball-up" in that department is something that must be avoided at all hazards. The cashier and his assistant should therefore be men who can keep their heads, take entries correctly, and pay out promptly and accurately. This sounds easy, but ideal cashiers are scarce. For a squad hustler we would suggest that you pick a man with a strong voice, tireless feet, a good memory for faces, and, if possible, an acquaintance with a majority of the shooters whom you expect at your tournament. He should also be good-natured, with plenty of it! There is nothing more annoying than to go down a line of shooters calling for one man, and on your return to the end you started from have a shooter look you mildly in the face and ask: "Are you calling me?" And this happens every day.

GOOD MANAGERS ARE FEW IN NUMBER.

The position of manager is the hardest post of all to fill properly. He is the general who directs everything, and who should have complete and absolute control in all matters pertaining to the running of your shoot. Managers are born, not made; and unfortunately there are very few good managers of tournaments on top of the earth. If you have nobody in your club who is capable of taking charge of the shoot, and of denying himself all the pleasure that may be derived from taking part in the sweepstakes, go elsewhere and secure the services of some outside party. A manager who shoots can run a tournament, and run it well; but there are one thousand and one things that are constantly demanding his attention, and if he shoots at all he nearly always shoots poorly. We assert this as an axiom: No man can do both things well at the same time—work and shoot.

The question of paying your help is another thing. We say: pay all the help you can, and pay it well. A paid man has to be attending to his business, and you have control over him; a volunteer is another article altogether. He requires delicate handling, and that's something he won't always get at a shoot, large or small.

LUNCH AN IMPORTANT FACTOR.

Before leaving for good the subject of large tournaments, we would call your attention to one other point—the luncheon provided at the grounds. As a rule, the privilege of serving lunches, and too often the privilege of running a bar, is farmed out to somebody, the club receiving a stated sum for the same. Just as sure as that somebody pays something for the privilege, just so surely is he going to try and get even, as he has a perfect right to do. Shooters do not mind paying a high price for an article so long as it is worth the money, but they do object to paying Delmonico's prices for something on the Bowery order of things. Select your caterer for qualities that endear him to the hearts of your epicurean citizens, and ask him to take charge of that part of the tournament that relates to the satisfying of your guests' inner man. This is another little matter, but it counts largely in the ultimate success of your shoot.

MERCHANDISE SHOOTS.

So far we have treated only of matters concerning the running of large tournaments. By large tournaments it must be understood that we mean tournaments where a good amount of cash is added to the purses. There are other large tournaments, such as those promoted annually by Lou Erhardt, of Atchison, Kansas, where a great proportion of the purses are merchandise, and where amateurs alone are allowed to compete for those prizes. In conjunction with the amateur programme, a schedule of events open to all was a feature of these shoots. The successful running of such tournaments re-

quires considerable executive ability, while the programme itself admits of far more variations than can be introduced into the programme for a crackerjacks' tournament pure and simple.

The planning and preparing for a tournament at which it is not proposed to add much money or to give merchandise prizes is really quite anxious work. A tournament with a large sum of added money can be made a success by carefully planning beforehand everything that will add to the comfort of the shooters or to the smooth running of the shoot. Add the money and the boys will be there; you can depend on that. But how are you going to figure on the attendance where there is little or no added money or merchandise prizes? You may be able to muster three squads if the weather is good; if it is bad and stormy, it's 10 to 1 that your shoot is a fizzle and the club out of pocket. There is, however, one thing to be said in favor of the small local tournaments: In good weather there is far more sport, more good-fellowship and real genuine fun at shoots of this nature than at one of the big tournaments.

WHY CHARGE 2 CENTS FOR TARGETS?

In connection with such tournaments we would point out that, in our opinion, the charge of 2 cents a target is excessive. What do you want to charge 2 cents for anyway? If you have grounds and a club house that will accommodate twenty-five or thirty shooters, the expenses of a tournament of this sort are very small. Five trappers, a cashier, referee and puller are all the help you will require. Say that your targets cost you $6 a 1,000 delivered on the grounds (many clubs are put to far less expense than that); if you throw only 3,000 targets at 2 cents each there is $60 return for $18, a profit of $42, out of which you have to pay less than $20 for your help. Club secretaries and members of tournament committees will bear us out in the statement that at 1 cent a target a tournament can be made to clear itself; 3,000 targets for a day's shoot is a very small number indeed. Many clubs in New Jersey that we know of often throw more than that number in an afternoon's shoot. Examine the scores in each week's issue of FOREST AND STREAM and you will find that we have based all our calculations on the very lowest estimates.

SOME OF "FOREST AND STREAM'S" GOOD THINGS.

The trap columns of FOREST AND STREAM are open to all and any criticisms on the foregoing. We do not pretend to have discussed every point thoroughly, but we do claim to have done our best to cover each point and to meet every objection. What we have written has been put on paper with the intention of giving trap-shooters a few new ideas on old matters We have trodden on no one's toes intentionally, and we have no axe to grind. FOREST AND STREAM was the first and only sporting paper to advocate the use and adoption of the Rose system; the others fell in line when they had to do so. FOREST AND STREAM was the first to adopt the tabulation of the scores—the only intelligible way of giving the news of the tournaments. FOREST AND STREAM gives reports of important live-bird events in a nutshell; the trap score type, showing the flight of each bird, photographs the man and the bird so accurately that a match can be followed bird by bird by a shooter who is sitting in his smoking room, with his feet on the mantel, a cigar in his mouth and a copy of FOREST AND STREAM in his hands.

The above is a partial list of some of the good things FOREST AND STREAM has done for trap-shooting. Some of our stands have been sneered at when first taken, but succeeding events have vindicated us satisfactorily. And now we take another stand, one that will, perhaps, meet with still less approbation when first considered, but one that we feel perfectly satisfied to leave to the good sense of trap-shooters. The stand is this: No tournament should be given by any club with the idea of filling the club's coffers with the proceeds of that shoot. If you add money, raise it at home; don't go abroad for it. If you don't add any money, don't charge 2 cents a target, or you will lay yourselves open to the charge of being after the boodle.

Now, gentlemen, we are ready for you to talk. EDWARD BANKS.

A Crack at the Shore Birds.

PORTLAND, Me., Oct. 12.—Jack is a member of the New Utrecht Gun Club and a royal good fellow. He struck Portland one day on board the yacht Susquehanna, and wandered out to the grounds of the Portland Gun Club and proceeded to wipe the boys' eyes in grand style.

Jack and I struck up an acquaintance, and shot a little race at targets, in consequence of which I was badly beaten.

Three weeks later Jack sailed up the beautiful harbor of our city and immediately started for our grounds, and when I arrived there I found him waiting to take my scalp once more; but this time I succeeded in getting his by the narrow margin of one bird in a 30-bird race.

After we got through shooting we arranged a little trip to a neighboring marsh for a forenoon's shooting at snipe, rail and yellowlegs.

We left Portland on the 7 A. M. train over the Grand Trunk, and reached our destination, Falmouth, about twenty minutes later, and struck down on to a promising bit of snipe meadow, which, however, was drawn blank.

In the next strip of meadow we had better success, and Jack succeeded in stopping two snipe to my one.

"Keep down! keep down!" and a bunch of teal that ventured too near our 12-bores paid toll to the extent of three nice, plump birds. Splash!—away goes a black duck out of a salt pond—crack! crack! splash! Down he comes within 10ft. of where he started, stone dead, a beautiful drake resplendent in his fall plumage. But we did not spend much time in admiring him, as we had other worlds to conquer—or at least we thought we had—but the shooting dropped off now, and beyond stepping into occasional pond holes or ditches, for which the Dyke (as this marsh is called) is noted, nothing served to vary the monotony except the pangs of hunger, which were soon appeased by lunch.

As the forenoon was pretty well along now, we started to work back toward home, as Jack had to be back by noon. The walk home was covered very quickly, so deeply interested were we in our discussion on guns and loads. (Jack swears by the Smith gun and E. C. powder, and I shoot a Francotte and Schultze powder.) And when I left him it seemed as though I had known him for ten years. I have not seen him since that day, but I shall always treasure that short forenoon's work with the scatter gun among the marsh birds of the old Presumpscot River and Casco Bay. Verily "The freemasonry of sport is a peculiar thing." MEDICUS.

The Atlanta Tournament.

THE Fulton Gun Club, of Atlanta, Ga., gave on Sept. 23-24 a most enjoyable tournament.

Atlanta has not heretofore gone in for very much trap-shooting for some reason or another, but now that a well organized gun club exists there you are pretty sure to hear of many events being brought off. From its geographical position, Atlanta possesses many advantages over other cities.

The principal work of the whole affair devolved on Mr. Hal Morrison, who was untiring in his efforts, and who succeeded so admirably that at the close of the programme he was given three hearty cheers and a tiger from the shooting men present.

The shooting of Mr. John Conner, of Knoxville, was splendid, with Judge Lindsay, his formidable running mate, not far behind. The Judge has a knack of accurately pointing the old Parker gun, with which Mr. Conner scored 98 out of 100 at New London, Conn., some years ago, that is quite artistic, and shows conclusively what two full-sized heavy-weights can do when properly matched. In the Peters Cartridge Co. contest Mr. Clarence Everett shot beautifully, grinding out his 25 targets like a veteran.

Two sets of traps were used throughout, and so painstaking was Mr. Morrison that but few balks occurred. The grounds were those occupied by Buffalo Bill's Wild West at Exposition Park, and although the background was none of the best, good shooting was done.

The live-bird events on the second day drew forth a good entry list and many spectators. Several of the latter no doubt went away fully convinced in their own minds that had they been shooting never a pigeon could have got away. Strange how one gets upset in such theories by actual experiment.

Mr. Alston made his debut at this shoot as a representative of the Winchester Repeating Arms Co., and shot splendidly, using their gun and ammunition. Atlanta being Mr. Alston's home, he naturally wished to make a good showing and in this he certainly succeeded most admirably.

The shooting was all at known traps, unknown angles, for the targets, and from five King traps, 28yds. rise, for the pigeons. Owing to the supply of the latter giving out the 12-bird event was cut down to 7.

THE DAILY AVERAGES

On the first day John Connor was far and away ahead of all his competitors, breaking 129 out of 135 shot at. Holt was next to him with 120 breaks, Peterman being third with 118. The following table shows the number broken by each man who shot through the programme of 135 targets, and also gives his percentages:

	Broke.	Av.		Broke.	Av.
Connor	129	95.5	Desmond	113	83.7
Holt	120	88.8	Swann	108	80
Peterman	118	87.4	Greene	108	80
Lindsay	116	85.9	Hamilton	106	78.5
Ford	115	85.1	Costello	101	74.8
Rawson	113	83.7	Van Gilder	89	65.9
Etheridge	113	83.7			

On the second day Knoxville was again to the front, Connor tieing with Etheridge for first honors with 68 breaks out of 75. Alston, who missed the first two events on the previous day, but who broke 102 out of 110, again shot well to the front, and was in second place with 67 breaks. Peterman was in the third hole with 66 breaks. The following table gives the record of each man who shot in the five regular programme events:

	Broke.	Av.		Broke.	Av.
Connor	68	90.6	Bizzell	62	82.6
Etheridge	68	90.6	Swann	61	81.3
Alston	67	89.6	Ruble	61	81.3
Peterman	66	88	Rawson	60	80
Lindsay	65	86.6	Ross	60	80
Baker	65	86.6	Hamilton	59	78.6
Byrd	65	86.6	Greene	59	78.6
Desmond	64	85.3	Van Gilder	56	74.6
Angier	63	84	Costello	52	69.3

THE GENERAL AVERAGES.

Eleven shooters shot through the entire programme of 250 targets. Connor, of course, after the work he did on the first day, was well in the lead. Peterman's steady gait landed him in second place, Judge Lindsay taking third place with Etheridge, only three breaks behind Peterman. Below are the general averages:

	Broke.	Av.		Broke.	Av.
Connor	197	93.8	Swann	169	80.4
Peterman	184	87.6	Greene	167	79.5
Lindsay	181	86.2	Hamilton	165	78.5
Etheridge	181	86.2	Costello	153	72.8
Desmond	177	84.2	Van Gilder	145	69
Rawson	173	82.3			

Each day's scores are given below:

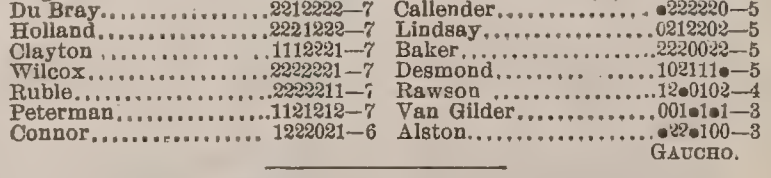
GAUCHO.



Team Race at Farmersville, Tex.

LITTLE ROCK, Ark., Oct. 16.—One day last week K. M. Moore, of Farmersville, Tex., wrote F. M. Faurote, of Dallas, Tex., the 20-bore crank, to come over and bring his friend Worden, adding that he and his running mate, Hope, would shoot them a race at live birds. He further stated that he had a fine lot of birds on hand, and could guarantee him a game that would be plenty hard enough.

Live birds are Faurote's forte, and naturally he could not resist so pressing an invitation, while Worden, too, said he felt that he could shoot the race of his life.

As though to help Moore make his prediction good, the day that the match was shot was a cold, bleak, cloudy one, with plenty of wind blowing directly away from the shooter. This aided the birds materially, but all of the contestants were in excellent form, and each put up a good score. In fact, so well did they shoot that only 3 of the 100 birds shot at escaped; the other birds scored lost were dead out of bounds. Faurote, with his little 20-gauge, topped the list with 24; Moore was second with 23, his 2 lost birds falling dead out of bounds. Worden and Hope each scored 22. This gave the race to the Dallas team by a score of 46 to 45 The loss of Hope's last bird, dead out of bounds, prevented a tie. The conditions were 25 live birds per man, American Association rules:

PAUL R. LITZKE.

Calumet Heights Gun Club.

CHICAGO, Ill., Oct. 9.—The weekly trophy contest of the Calumet Heights Gun Club took place to-day. The wind was blowing right in the shooters' teeth and made hard shooting. Lamphere was the winner in class A, Metcalfe in class B and Black in class C. Scores:

Class A.

Paterson	110101101010011w
Lamphere	11111111101111111111110101—22
Knowles	11110111111101111111011110—21

Class B.

Metcalfe	01110111111111101111111111—22
Norcom	10101101100101110101111100—15
Houston	10101101100101110111010101—16
Greeley	11111111111001111111110011—21

Class C.

Black	11101110110110011011111011—18
Harlan	10110111101010000101101100—13
Chamberlain	00010110111111111011010111—17
Davis	10100101100001110000101100—10

Two team races were shot during the afternoon. The conditions were five men to a team, 15 targets per man, unknown angles. The scores in No. 1 were:

Norcom's team: Metcalfe 14, Lamphere 13, Norcom 12, Black 8, Harlan 8—55.

Houston's team: Paterson 13, Knowles 12, Greeley 12, Houston 9, Chamberlain 8—54.

The second race was just as close an affair as the first, Norcom's team winning again by a single break. Scores:

Norcom's Team: Lamphere 14, Norcom 13, Metcalfe 12, Black 9, Harlan 6—56.

Houston's Team: Knowles 15, Patterson 13, Greeley 11, Chamberlain 9, Houston 7—55.

The results in the four other sweeps were:

No. 1, 10 targets, unknown traps and angles: Lamphere 9, Paterson and Black 8, Knowles, Houston and Chamberlain 6, Metcalfe, Norcom and Greeley 5, Harlan 1.

No. 2, same conditions: Lamphere 9, Metcalfe and Norcom 8, Paterson and Knowles 7, Greeley and Harlan 4, Houston and Chamberlain 3, Black 2.

No. 3, 15 targets, unknown angles: Norcom 14, Metcalfe 13, Greeley 12, Houston 10, Harlan 6.

No. 4, 15 targets, snipe shooting: Metcalfe 12, Houston and Greeley

PATTY.

Audubon Gun Club, of Buffalo.

BUFFALO, N. Y., Oct. 10.—The Audubon Gun Club, of Buffalo, held its annual merchandise shoot and field day at Audubon Park to-day. The attendance of members was all that could be asked. Forty-one entries in the 50-target events, and twenty-nine in the badge shoot, make a goodly showing for any club, even for the Audubons.

In the 50-target race, the merchandise event, E. C. Burkhardt and Harry Kirkover tied for first place on 45 out of 50. In the club badge contest Johnson was the winner in Class A, Ward in Class B, and Hankins in Class C. The scores in the two events were as below:

MERCHANDISE SHOOT.

E C Burkhardt	45	Bird	37	Schneider	30
H D Kirkover	45	C S Burkhardt	36	Squires	30
Norris	44	Frieze	36	Downs	30

Answers to Correspondents.

No notice taken of anonymous communications

H. V. H., Reading.—Try Barnegat.

C. S.—See article in our Shot columns bearing on your inquiry about the Long Island ducking law.

W. H. S., Philadelphia, Pa.—Address Price Bros. or D. M. Crane, Canadensis, Monroe county, Pa.

W. R., Plainfield, N. J.—We think that you could find such shooting as you desire near Cold Spring, L. I. Address John Walford, of that place, for information.

C. E. L., N. Adams, Mass.—What will stop a young dog from having fits? He is very weak afterward, froths at the mouth and stiffens right out. Age eight months. Ans. Treat for worms. Give 5grs. of bromide of ammonium and 10 drops of the fluid extract of cannabis indica twice a day.

R. C. B., British Columbia.—The animal you describe as being of "the size of a small rabbit, as fond of water as a muskrat, of an iron-gray color, fine, soft fur, with no tail, and caught on a small creek on top of a mountain in Dry Belt, and from description very much resembles a guinea pig," is probably a sewellel.

J. S., Detroit, Mich.—My dog was scratched by a squirrel in the white of the eye last week. The eye has been all swelled and sore for several days, and now there is a sort of white web over it. I have been washing it with cream and blowing sugar into it, but it does no good, it only relieving the eye so that the dog can keep it open for a while. Ans. Bathe the eye four or five times a day with hot water in which has been dissolved some crystal boracic acid, half a teaspoonful to two pints of hot water. Also put one or two drops of the following in the eye twice a day: Atrophine sulph. 2grs., water ½oz. Mix.

PUBLISHERS' DEPARTMENT.

Towards the Setting Sun.

'Tis said that every land has its season, a time when nature smiles in all her scenic beauty. Mexico and California have opened their doors for the winter travel that seeks a milder and more genial clime. The Southern Railway, "Piedmont Air Line," in connection with the Southern Pacific, via New Orleans, offers the most attractive route. Taking a southerly course, no snow or ice, where the winds are soft and mellow, and the very air coaxes one to revel among the thousand charms of nature. The Southern Pullman Vestibuled Limited, operated solid between New York and New Orleans the year round, is one of the finest equipped vestibuled trains, carrying dining and sleeping cars, and, after Nov. 9, the Sunset Limited will resume its schedules to connect, thus giving the most superb service between New York and the Pacific Coast. For further information call or address General Eastern Office Southern Railway, 271 Broadway.—*Adv.*

Woven Wire Fencing.

THE Page Woven Wire Fence Co., Adrian, Mich., publishes a monthly illustrated paper called *The Coiled Spring Hustler*, which gives a lot of breezy information regarding the merits of their product. This will be sent free of charge to farmers or others interested in fencing.

From various articles in the September issue it appears that neither buffalo, elk, cattle, horses, mules, fallen trees, fire, freshets nor battering rams can get the better of this wonderful fence, which gives to the onslaught only to spring back into shape immediately afterward taut as a bow string.

The Page people believe that the Iron Age has passed, and that only steel is good enough for progressive property owners nowadays.—*Adv.*

Wild Rice.

R. VALENTINE, Janesville, Wis., has a good supply of wild rice seed his year.—*Adv.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, OCTOBER 31, 1896.

VOL. XLVII.—No. 18. No. 346 BROADWAY, NEW YORK.

For Prospectus and Advertising Rates see Page x.

The FOREST AND STREAM is put to press on Tuesdays Correspondence intended for publication should reach us by Mondays and as much earlier as may be practicable.

THE FORESTRY AMENDMENT.

IF the people of the State of New York shall vote away the integrity and security of the Adirondack Forest Preserve now guaranteed by the Constitution, it will be because the voters fail to realize what they are doing. Important as are the other issues at stake in the election, let us not be blinded as to this one, nor be deceived into the thought that it is not of momentous concern.

Section 7 of Article VII. of the new Constitution reads:

"FOREST PRESERVE.—SEC. 7. The lands of the State, now owned or hereafter acquired, constituting the Forest Preserve as now fixed by law, shall be forever kept as wild forest lands. They shall not be leased, sold or exchanged, or be taken by any corporation, public or private; nor shall the timber thereon be sold, removed or destroyed."

That declaration of the sentiment of the State was adopted with an unanimity which broke into applause in the Constitutional Convention; the measure was accorded a reception such as for warmth and enthusiasm and unqualified indorsement was given to none other of the thirty-three amendments adopted. It was the deliberate, definitive, determined decision of the citizens of the State—who had seen their trusts betrayed, their birthright sold for a mess of pottage, their woodlands given over to vandals, robbers and despoilers, to be felled by the axe, drowned out by back-waters, scourged by fire, inclosed in vast areas in wire fences and shut off by trespass signs—that from that time forth the betrayal and robbery should cease; and that as for the Legislature, it should no longer have the power to yield to the demands and persuasions of private and corporate greed. The act of rescue came fifty years late; but when the people did adopt it they meant it; and they meant it for just what it says and for all it says, that "the lands of the Forest Preserve shall be kept forever as wild forest lands They shall not be leased, sold or exchanged "

That declaration embodies public opinion and represents the public interest. But, needless to say, it does not suit the scheming individuals who are hungering for their old-time license to use public property for their own personal advantage; and these intriguers have now come forward with a cool proposition that the people of the State shall retract their will, as expressed in the forestry section of the Constitution, by amending that section to read as follows:

"SEC. 7. The lands of the State, now owned or hereafter acquired constituting the Forest Preserve as now fixed by law, shall be forever kept as wild forest lands. Except as authorized by this section, they shall not be leased, sold or exchanged, to be taken by any corporation, public or private; nor shall the timber thereon be sold, removed or destroyed. The Legislature may authorize the leasing for such term as it may by law fix of a parcel of not more than five acres of land in the Forest Preserve to any one person for camp and cottage purposes. The Legislature may also authorize the exchange of lands owned by the State situate outside the Forest Preserve, for lands not owned by the State situate within the Forest Preserve The Legislature may also authorize the sale of lands belonging to the State situate outside the forest preserve; but the money so obtained shall not be used except for the purchase of lands situate within the Forest Preserve, and which, when so purchased, shall become a part of the Forest Freserve."

The end sought to be gained by this amendment is wholly and purely private, personal and selfish in character, and contrary to the rights of the public in the public's own possessions. The intention is to open the way to hand over the choice locations of the Adirondacks for camp and cottage purposes. It contemplates a free and unrestricted leasing of lands, in a ratio of 5 to 1—five acres to one person. The number of leases is unlimited; in practice it will be restricted only by the number of choice locations to be picked out and the number of people who are willing to take something for nothing and pick them out. There is no limit as to the duration of the leases; they are to run for such terms as the Legislature may fix; and there being nothing in this proposed amendment to forbid, the Legislature may fix them for one hundred years. The whole intent and effect of the amendment is and its practical effect would be again to place the conservancy of our forest lands in the hands of the Legislature, where again and again experience has shown such interests to be unsafe. The teaching of the past, as exemplified in repeated instances, is that if left to itself the Legislature cannot be depended upon to preserve to the people their right in the public lands when such rights are invaded by individuals or corporations for their own personal aggrandizement.

President Amsden, of the New York Association for the Protection of Fish and Game, in his protest against the adoption of this amendment, likens the proposed invasion of the Adirondacks by individuals to a giving over of the city of New York's Central Park to private squatters. The history of the Central Park shows what is to be expected from the Albany Legislature when it comes to a question of protecting park for the people. On more than one occasion the citizens of New York have had to take the Legislature by the throat to prevent its giving over Central Park to uses other than public; the last occasion was only last year, when if left to themselves the Senate and Assembly would have given permission to a company of showmen to cover the lower end of the park with exposition buildings.

It was precisely because the Legislature had connived at legalized despoiling of the North Woods that the citizens of the Commonwealth determined once and for ever to take from it by this constitutional enactment the power for further mischief. Security of the people's heritage in the Adirondack forests is to be preserved only by keeping intact the constitutional prohibition of selling, exchanging or leasing the public lands. The amendment proposed to nullify the section should be overwhelmingly defeated next Tuesday. Every vote will count; it will not be enough to avoid casting a ballot; a negative vote should be registered. Mark the "No" of the forestry amendment space on the ballot. Save the forests. Preserve them to the people, to whom they belong. Repeat again and with the emphasis of a full vote the former declaration that the wild lands of the Forest Preserve "shall not be leased, sold or exchanged."

It is not in the least an occasion of surprise that the President of the Fisheries, Game and Forest Commission should favor the proposed amendment. The same official signalized his coming into office by advocating the pernicious bill, which became a law, to permit the sale of game the year around. His advocacy of the measure, he tells us, is prompted by a belief that "the forestry interests of the State require the adoption of the amendment," but the only "forestry interests" set forth in his special pleading are the private interests of individuals who are already intrenched in occupancy of the public domain, and for whom he urges that, having already been granted special privileges in the past, they should continue to enjoy them in the future. The counsel of President Davis in this instance is not a whit less unsafe than was his counsel as to the all-the-year-around sale of game amendment; and his opinion should be given no weight in an intelligent consideration of either one subject or the other.

That part of the proposed amendment which relates to the sale and exchange of lands "within the Forest Preserve" and lands "outside the Forest Preserve" is a hocus-pocus. There is nothing now in the Constitution to forbid the sale of lands "outside the Forest Preserve," nor anything to forbid the acquiring of lands "within the Forest Preserve." There is therefore no necessity of any amendment in this respect. The only effect of the amendment if it should be adopted would be to throw the public lands into the possession of individuals, and to multiply the trespass signs which already confront the Adirondack visitor at almost every turn. The provision might well be entitled "An Act to Shut Out the People from their Own Lands." If the voters understand this job for what it is, they will defeat it next Tuesday for all time.

THE HEATH HEN AGAIN.

IN response to an inquiry by Mr. C. H. Ames for information respecting the heath hen of Martha's Vineyard, a Boston correspondent gives us as the fruit of his own observation some particulars respecting the present condition of those birds. In connection with his very interesting communication we print also an account sent to the naturalist Audubon in the year 1832, describing the heath hen as then found in the same haunts. In these letters, written thus with an interval of more than sixty years, a noteworthy parallel is found in the fact that each writer records that within the term covered by his own observation the supply of the game was lessening.

As we have remarked before, the persistence of the heath hen on Martha's Vineyard is one of the most interesting phenomena in the history of American game birds. The total number of these grouse on their circumscribed island home must always have been comparatively insignificant, and they appear to have been pursued by man from the beginning, with an at least periodically recurring reduction of the supply by over-shooting; and yet they have maintained themselves, and are found to-day in a stock which gives promise of surviving indefinitely if it shall be given fair opportunity.

One condition which unquestionably contributed to the security of the heath hen was found in its immunity from destruction by vermin. This favorable circumstance no longer exists; for within recent years foxes have been introduced into Martha's Vineyard. They were liberated on the island out of revenge; and are likely to prove as mischievous as did the foxes of ancient time which that other avenger, Samson, let go with firebrands tied to their tails in the corn of the Philistines; or as the pickerel which a malevolent Adirondack guide planted in the trout waters of his enemy.

Nature is kinder than man to her children. By a merciful provision the birds adapt themselves to changed conditions; learn how to evade new agencies which menace their existence, and to maintain their race in the face of unaccustomed perils. Thus ground-nesting species confronted by prowling vermin may learn in course of time to build their nests in trees, and there lay their eggs and rear their young in security. But against man—the pursuer who walks on the ground, digs into the earth, climbs into the trees, floats on the water, reaches with his missiles into the air—no creature, be it swift footed or winged, can maintain itself; that is to say, if it be good to eat and will fetch a price in the market. When one comes to study the history of the heath hen in America no fact presents itself more distinctly and irrefutably than this, that the bird was exterminated from its old-time ranges by no other agency than market-hunting. There has been preserved for us very explicit testimony concerning this fact in one particular section, the brush plains of Long Island. "From one learn all."

A letter written by Dr. Samuel L. Mitchill, of New York, to Alexander Wilson in the year 1810 records than the heath hen of Long Island then inhabited chiefly a district of from forty to fifty miles in length and not more than six or seven in width, in Queens and Suffolk counties, which country, being covered with a growth of pitch pines, dwarf oaks and shrubs, was commonly known as "the brushy plains." In Dr. Mitchill's time thousands of cords of firewood were brought annually from these barrens to New York city, and experience having proved that in a term of forty or fif years the new growth of timber would be fit for the axe Dr. Mitchill prognosticated that the city would "probably for ages derive fuel from the grouse grounds," and that "the reproduction of trees, and the protection they afford to the heath hens, would be perpetual, or, in other words, not circumscribed by any calculable time, provided the persecutors of the latter would be quiet."

To be quiet, however, was the very last thing in the world the persecutors of the birds proposed for themselves, as Dr. Mitchill himself appears to have realized. They had not the slightest interest in "perpetual protection" for the heath hens; there was money for them in the birds dead; and they were influenced as little by sentimentality as by the law. For there was law enough to protect the birds even then, if the law had been of any avail. In 1795 the Legislature enacted a law which forbade the killing of heath hens in Suffolk or Queens counties between April 1 and Oct. 5 under a penalty of $2.50. But by 1810 the market price had risen to from $3.75 to $5 per brace; and so eager was the pursuit, Dr. Mitchill records, "that a large proportion of those they kill are but a few months old, and have not attained their complete growth." He adds:

Notwithstanding the protection of the law, it is very common to disregard it. The retired nature of the situation favors this. It is well understood that an arrangement can be made which will blind and silence informers, and that the gun is fired with impunity for weeks before the time prescribed in the act. To prevent this unfair and unlawful practice, an association was formed a few years ago, under the title of the Brush Club, with the express and avowed intention of enforcing the game law. Little benefit, however, had resulted from its laudable exertions; and under a conviction that it was impossible to keep the poachers away, the society declined. At present the statute may be considered as operating very little toward their preservation. Grouse, especially full-grown ones, are becoming less frequent. Their numbers are gradually diminishing and, assailed as they are on all sides almost without cessation, their scarcity may be viewed as foreboding their eventual extermination.

The Long Island Brush Club must have been one of the pioneer game protective societies of this country. When we consider how feeble in supply was the heath hen, how precarious its hold on existence, how unique its place among the game birds of the continent, we may well regret the lack of success which attended the club's efforts in its behalf.

The Sportsman Tourist.

IN THE SOUTH SEAS.

In November of 1856 I sailed from Edgartown, Mass., on a whaling voyage to the Indian Ocean. We proceeded on our way without unusual incident (save the capture of a few small sperm whales in the south Atlantic) until we reached the Crozett Islands, 46° south latitude, 52° east longitude, in the southern Indian Ocean.

While cruising in the vicinity of those islands for right whales we approached so near the land one day that a small herd of sea elephants were discovered, hauled out on a sandy beach in a sheltered nook on the otherwise bold and rocky shores.

We killed a few and took the blubber to the ship. It was decided to return the following day to kill the remainder, about 100 in number, which task would take two days to accomplish; we would then raft the blubber, tow it off shore (the ship standing close to land for this purpose) and take our catch on board. With this understanding we were on the following morning landed with thirteen men, provisions for three or four days, and implements for killing the animals and caring for the blubber.

After we were put on shore the boats on returning to the ship encountered a whale, which was killed and taken to the ship and cut-in, while we of the shore party were busily engaged in killing and removing the blubber from the large seal-like creatures. Soon after a dense fog came on, and this was succeeded by many furious gales, which drove the ship far to the eastward, while we of the shore party looked for the ship's return and looked in vain for twenty-two days. On the morning of the twenty-third day the joyful sound of "Sail, ho!" was heard from the hill top. The ship was far away and the wind was light, but we at once began to make ready to save the blubber for which we had worked so hard. The day was far advanced when the ship rounded the island, and boats were sent ashore to assist in saving our catch. Darkness was rapidly coming on, and with it a storm arose, and before the ship could reach us we were compelled to abandon our raft of blubber to the sea birds and devote all energies to the task of saving our own lives. Unfortunately the lanterns, such as are carried in whale boats, had been removed during the late storms, and we had no means of letting the people on the ship know our position. It was a critical moment; and at last as the ship was approaching we saw that she was luffing off shore. I now told the men our only chance of life was to make those on the ship hear us and make known our presence. The order was given and all united in one prolonged cry, which was happily heard, and an answering call came faintly over the foaming billows. The ship was kept off and came to under our lee (which made it easy for us to get on board), the maintopsail was hauled back to check the ship's progress, and soon we were treading the deck of our ocean home.

The sea elephant which we found at this island was about 16ft. long, with a thick, heavy skin, covered with short, dark-brown hair, the eye full and bright, the forepaws or pectoral fins short and fleshy, the lateral or propelling flippers like those of the sea lion, walrus and some other cetaceans; powerful jaws, and strong, large canine teeth. The appearance of the creature denotes great strength. Its movements on land are sluggish, yet in the water they are very active and rapid swimmers. Our method of killing was by shooting. The creature was pricked with a lance, when it would raise its head to a height of 7 or 8ft. and with mouth wide open utter a hoarse, guttural cry. When it was in this position a ball was shot through the brain, entering the roof of the mouth and coming out the top of the head. Death was instantaneous, the head falling to the ground like the fall of a trip-hammer.

When lying on the beach the elephants formed a compact mass, in many instances one overlapping another; in this position, it seemed, their desire for sleep was intense. When we had shot as many as we wished at one time the rest would lie down and contentedly sleep while we were at work only a few feet away. Even the sound of the gun would only disturb those nearest, and not a single attempt to escape was made, although they were unguarded by night. The name of sea elephant was probably given these animals because of a loose membrane which lies folded across the nose halfway to the eyes, and which can be relaxed and dropped down below the nose like a short proboscis; but the usual appearance of the appendage is as if folded across the nose, and when the beast is irritated the membrane is inflated there and the breath can be expelled through it, making a peculiar noise.

The herd which we found on the island were all males, and had come to land to shed their hair, and kill the vermin which infest all the inhabitants of the sea that have a covering of hair or fur; all the sea birds suffer too, for they cannot escape the parasites which lie in wait for every living thing; the whale kind, having a smooth cuticle, suffer the least of all the inhabitants of the great deep.

In the stomach no food was found; they had been on land so long that all the food had been digested; doubtless squid and fish form their principal diet.

Previous to my visit, large vessels were fitted expressly for the South Seas to capture the sea elephant for the oil. Kerguelen Land, Hurds Island and many other localities were the breeding grounds for vast herds; and when we remember their great bulk and the large amount of food required to sustain the life of a single individual for one year, then we can calculate the enormous amount of fish, and what fishing banks there must be in those regions. For the last twenty-five years the sea elephants have been but seldom disturbed, and they are now doubtless increasing in numbers; but man, the relentless destroyer of animal life, when he finds a further use for these animals (either their oil or pelt), will again begin the crusade, and cease not until he has girdled the earth in his search.

At the time of my visit multitudes of penguin were congregated on the island in the moulting season, and it seemed as if every available spot was literally packed with these strange birds. To pass through the masses of penguin it is necessary to brush them aside with one's foot, for not an inch will the penguin yield to the approach of man; but stand their ground and pick at him with their pointed bills, uttering hoarse though loud cries, repeated by tens upon tens of thousands of penguin voices. Should the intruder's legs be not well protected, the flesh will often be wounded by the persistent attack of the squalling hordes. It tries the nerves of the strongest man to pass through an army of these birds.

I have never visited the home of the penguin at nesting time, when it is said they lay out the ground like a city with streets and squares; yet it seems more than likely that something of the kind may be practiced; for when the birds come from the cold waters of the ocean and crowd through the nesting ground, the cold water dripping on the warm eggs would destroy them; therefore they have learned that streets are a necessity where such multitudes are coming from and going to the ocean, which is at all times cold. It is said that the male bird brings food to the female during incubation, but I cannot vouch for this.

As is well known, these birds cannot fly, since there are no feathers on their wings, but a tough black skin instead. But they are like fish in the water, and it was very interesting to watch their landing when they come ashore through the huge breakers. As the wave comes rolling landward, the penguin swims before it until the broken water comes close; then it faces off shore, dives under the comber, and like a flash comes up on the billow and rides swiftly to land on the top of the wave. When on land the penguin stands so erect that he has the appearance of being in danger of falling over backward.

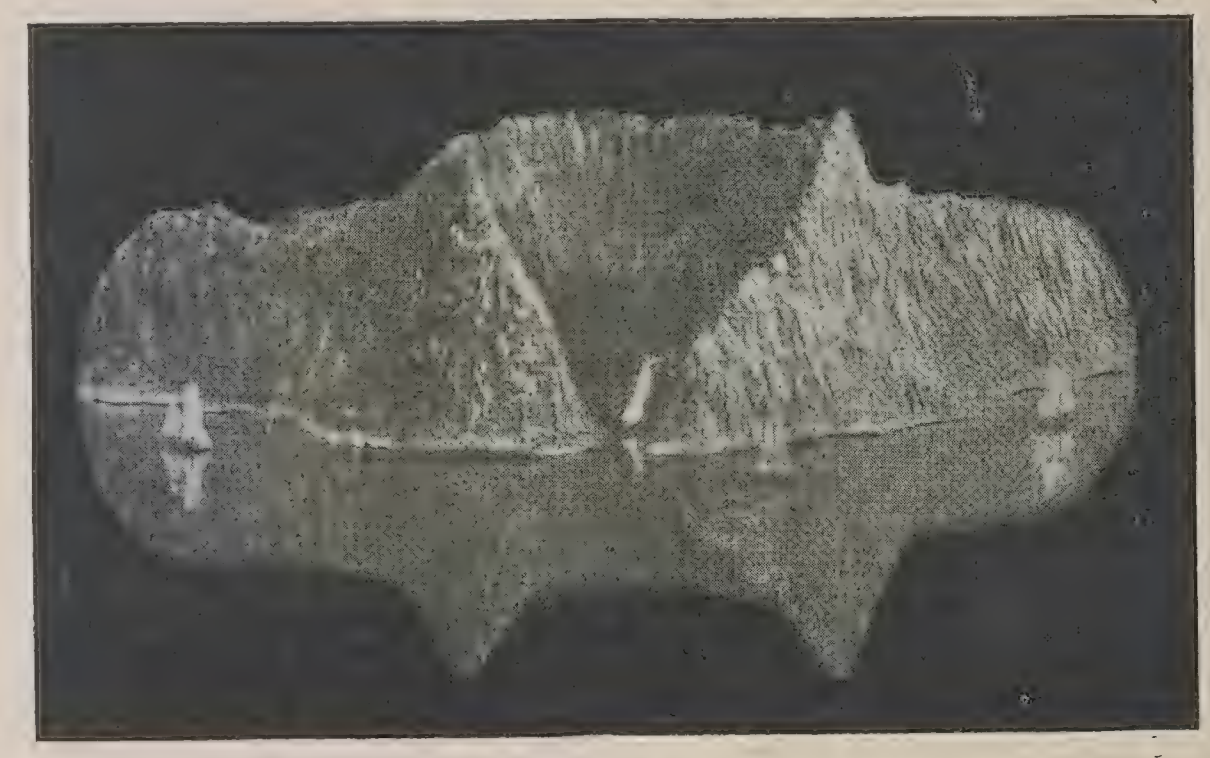
On the island we also found a small white land bird, variously named the sheath-bill, white Paddy, and by us 2:40, because they were so fleet of foot. When we first went on shore they would run before us with scarcely an attempt to fly unless hardly pressed, and then only for a short distance; yet we often saw them coming from seaward, though they are not web-footed. Their cry is like the peep of a lost chicken. They were very inquisitive. Once, when far from camp I sat down to rest beneath a shelving rock which projected a little over my head, in a few moments the peep of the little sheath-bill was heard overhead. I looked and there were the red eyes looking inquiringly down upon me. Quietly raising my hand, I caught it by the legs. Its cries soon brought more, which were caught in the same way, until I had as many as I wished to carry over the rough road I had to travel.

After leaving this island we kept on our eastward course to the islands of St. Paul and Amsterdam, which lie about midway of the Indian Ocean on the old track of vessels bound from the Cape of Good Hope to Australia, and more than 2,000 miles of longitude from either and 700 miles from Kerguelen Island to the S.W.

St. Paul is a most lovely spot. It is in reality a volcano thrown up from the great depths of ocean. On the eastern side is a large crater, the wall of which has worn away by the action of the sea until a passage has been made for the ebb and flow of the ocean tide. At the period of my visits there was sufficient water on the bar at the narrow entrance (about 6ft. mean tides) to allow the passage of small vessels into the crater basin, where a perfectly safe shelter is found. This is utilized by the sturdy fishermen of the isles of France and Burbon for headquarters of a fishery. The harbor is about two miles in circumference and nearly circular in outline, having a depth of more than thirty fathoms in the center, gradually shoaling to the shore. The walls of the crater rise to a height of over 700ft., and form the highest part of the land. The island is two and one-half miles from north to south by one and one-half miles wide, is triangular in form, with its longest angle facing the east, midway of which is situated Crater harbor. The entrance to the harbor is only about 90ft. wide. As one stands in the crater of this volcano the thought comes to us that it once vomited forth sulphurous flame, molten lava and ashes of earth's internal fires, yet now it has become the seat of a peaceful industry. Hot springs are numerous along the shores of the basin; one tested by us gave a temperature of 212° F. On the right of entrance stands a rock called Nine-pin Rock. The early navigators report seeing fire issuing from the seams and rifts in the walls of the crater at night, and when this island was last visited by me steam was constantly rising from this same place.

Kelp and other seaweeds, as they are commonly called, grow in profusion around the island, and this dense growth of marine vegetation is the home of a variety of fine food fish. Crayfish were so abundant that an iron hoop, with netting stretched over it, baited with fish and let down on the bottom for a short time, would when drawn up contain a bushel or more of these crustaceans piled one upon another.

The Island of Amsterdam, situated sixty miles to the north of St. Paul's, is much the largest of the two, and has an elevation of over 2,000ft. It rises abruptly from the sea on the west, a perpendicular wall for 300 or 400ft., then rises gradually to its highest point, then slopes toward the east, where it is not much above the sea level.



Fish are very abundant in the shallow waters around the island. The seaweeds here, as elsewhere, are a remarkable growth; in many instances they are several hundred feet in length, yet not larger than a common lead pencil is the stem which reaches down and grasps the bottom. It is quite strong, and we always tied our boats to it when fishing instead of using an anchor.

This island, just before my first visit, was the scene of a very remarkable shipwreck. In the year 1851 or 1852 an emigrant ship from England bound for Australia ran ashore on the west end in a dense fog. The weather was boisterous and the ship quickly broke up, yet every one on board got on shore, where they found themselves on a shelf (as it were) of rock, with a perpendicular cliff of solid stone before them more than 200ft. high.

To scale the cliff was impossible, and they had no boat. On either hand the cliff jutted out into the sea. There was no way to get around the point but by swimming. Two men volunteered to make the attempt, and succeeded, taking with them a quantity of small line. The brave fellows at length reached a place where they could get on the top of the island, then they went back to the cliffs that imprisoned their comrades. Their appearance on the precipice above was hailed with shouts of joy, and when the little line was lowered down, and communication was established between those above and those below, what a burden of suspense must have been taken from them. There was glad activity among them all; the small line drew to the top a larger one, more men were drawn to the top, more ropes were raised and more appliances got in position, and the work of rescue went happily on, and at last on the second day all were rescued from their perilous position. Some provisions too were saved and raised to the top.

On the third day a sail was seen approaching. Now, if they could attract the attention of those on the ship they would surely be rescued. Large quantities of grass and brush were gathered and set on fire, a great smoke rose heavenward, and after a while it was seen that the ship had changed her course directly for the island, and at last she approached near enough to see the flag which had been raised. The colors on the ship were dipped in encouragement, and all knew that their rescue was now a matter of detail. The women and children were taken to the low part of the island, where they could be embarked to the rescuing ship, and the entire company was saved.

I am sorry to have forgotten the name of the wrecked ship or her rescuer. The number of people was between 300 and 400, crew and passengers. Five years later we saw the ropes dangling from the cliff, marking the spot where once so many lives had been in peril, yet fortunately without the loss of a single one. Taking into account the position of the shipwreck, the isolated part of the world in which it occurred, and all the circumstances, I count it as the most fortunate shipwreck that ever came to my knowledge.

CRATER HARBOR—ST. PAUL ISLAND.

From model prepared under the direction of Capt. Herendeen.

The fur seals were found on these islands before man made war upon them so effectually that scarcely a specimen can be found where they were once abundant. The whalemen also found lucrative employment in the capture of the whale in this vicinity, but at present the hardy fishermen alone visit the place to prosecute their vocation.

The albatross of these high southern regions is a most interesting bird. Its great size and magnificent, soaring flight make it an object of continual interest. The seaman when he looks over the broad expanse of ocean and sees these winged wanderers of the deep, the only sign of life for many days in succession, at length begins to look upon them as companions which are not to be molested, or at least not injured. Many ship masters will not allow them to be caught at all. So persistent is their attendance on a whale ship that the individual birds often become known by some marks and are given names. When the ship is becalmed the albatross is easily caught with a hook baited with a piece of pork or blubber. This floats and is eagerly picked up by the bird; a quick pull on the line fastens the hook in the curve of the horny beak, and the bird is not hurt at all. The sailors rob the birds of some very pretty feathers, of which there are but few, found under the wings, and the bird is then set free.

My sister, Mrs. Lake, who sailed with her husband for fourteen voyages, relates the following incident as witnessed by her: One day after a long continued gale there were a great many birds around the ship, albatross, petrel (or Mother Cary's chickens, as the sailors love to call them), and many other sea birds. One huge albatross sat on the water for a long time with a Mother Cary's chicken sitting contentedly on its back. No one on the ship had ever seen such companionship before; neither

have I witnessed such a sight in several years' cruising in the southern oceans. The petrel is a strange little fellow, always on the wing during the hours of daylight—and in those high southern latitudes the days are long in summer—yet I have never seen one sit on the water to rest or for any other purpose. It holds its position near the ship in the strongest gales and hovers near the water with its little web feet, constantly treading the water with the lee foot, which helps it to hold its position against the force of the wind. It seems impossible that any living thing can do without rest or sleep, yet certainly this little bird can do with the least of either of any creature known to me.

The whale ship is a veritable storehouse of good things for the ocean birds. When a whale is taken and cut-in, a thousand choice morsels are cut off and float around for them to pick up. The albatross does not hesitate to attack the carcass and to fight for his share; and often in such numbers as to be a source of annoyance to the officers using the spades. Again during the process of trying out the oil from the blubber, quantities of scraps and lean cut from the blubber are thrown over the ship's side into the water, and this is a continual feast for the birds. The albatross gathers up the largest pieces, the mollemokes and haglets take all the larger, while the little petrel, hovering here and there on tireless wing, seems content with the finest particles that float upon the surface of the water.

There is another reason why the birds congregate around a whale ship. When on cruising ground at night the ship is put under short sail, so that very little headway is made; and the birds can sit on the water and often swim along as fast as the ship moves, or at least a few strokes of the wings will bring them alongside. Every tub of refuse thrown overboard is a signal for all to come to the feast, and it is remarkable how well they know the sound of dumping gurry. During the night a large, bright light is kept burning to light up the deck to facilitate the work, and this lights up the sea around as well. I have often seen the albatross, when the ship was hove-to, hover or rather soar very near the ship, peering down upon the deck as if seeking to learn if there was any blubber on board, often passing very near the yardarms. There is not a movement of the wings as the great birds scale along, and one can but watch and admire their graceful movements.

When one remembers the vast expanse of ocean in this southern part of the world it is very evident that we of northern latitudes can scarcely comprehend the great difference between the two hemispheres.

In the south the parallel of 40° passes to the south of the Cape of Good Hope, Australia, the North Island of New Zealand and all of South America, excepting Patagonia, Tierra del Fuego and adjacent islands. South of the parallel of 50° south latitude, with the exception of a small fragment of Patagonia, Tierra del Fuego and the adjacent islands, Falkland Islands included, not a human being has an habitation and home. How great an expanse of ocean is found to the south of 40° south latitude is readily seen by referring to the map of that region. If there be a body of land in the south it lies almost entirely within the Antartic Circle.

A little south of the parallel of 50° one can sail entirely around the globe with the exception the south end of South America—Patagonia—without seeing land. In contrast to this, in the northern half of the world to the north of 50° some of the greatest capitals of Europe are found: London, Brussels, Berlin, St. Petersburg, Christiania, Stockholm, with Paris not one degree to the south of this parallel, and man is found almost as far as land extends.

Such a contrast as this cannot fail to impress one with the vastness and solitude of the great circumpolar southern ocean. If there be a continent within the Antartic Circle it has been reached by few and only in isolated places, where it was difficult to determine if the land was a group of islands or a large body of land. Such enormous fields of ice guard the approach to high southern latitudes that navigation is extremely perilous. But high volcanic peaks have been seen beyond the verge of this unknown region, and these alone proclaim the fact that land does exist beyond the farthest point reached by man.

E. P. HERENDEEN.

Florida Protective Interests.

SPORTSMEN in Jacksonville will make test cases of violations of the game law. This is the only proper way to make the law effective. It is unlawful to trap quail during any season of the year, or to have live birds of this species in one's possession, yet they are openly offered for sale in this city. In extenuation of this fact, excuses have been made that the birds in certain instances were shipped from Georgia, the season in that State opening fifteen days before the Florida season; but it is doubtful if this subterfuge will hold in the courts, as the mere fact of possessing the living or dead bodies of game constitutes a misdemeanor in the eyes of the law until the open period begins, and subsequent to its close.

The State of New York found itself compelled to close the game season entirely for a period of years, and to strictly enforce the prohibitory law during its operation. Unless trapping, pot-hunting, and shooting out of time is suppressed in Florida, a similar enaction must ultimately be made in this State. The true sportsman desires the preservation of game, and the shorter the open season the better he is suited, because he realizes the necessity for providing against the rapid extinction of the species embraced in the laws.

The present statute is incomplete, and at the last session of the Legislature amounted to simply a temporary compromise accepted rather than the total death of the measure. Next year it is hoped that the lawmakers will realize the gravity of emphatic action in the premises, and perfect measures that will insure the protection of the game birds and animals of the State.

The press of Florida is unanimously in favor of stringent game statutes, and every paper published in the State should take up this matter and present it to the people in a light that will convince them of the necessity for concerted action.—*Jacksonville Times-Union.*

The FOREST AND STREAM *is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.*

IN THE CASCADES.

The Waldo Lake Country.—I.

IT has been said that years and experience bring wisdom. While this may be true as a general proposition, observation will hardly warrant such a presumption in favor of the sportsman. At least he is prone to forget the admonitions of sad experience, and while always promising reformation continues to plan new trips into remote and untrodden regions. Some of the greatest gillies within the limited range of my acquaintance are old, rheumatic, worn-out sports. One of these is sitting right here at this desk now reviewing unnecessary hardships and privations endured by himself and certain other less aged but equally guileless sports on a recent trip for big game in the Cascades. One would naturally think that nearly forty years of almost incessant hunting and fishing ought to make a fellow just a little bit discreet about undertaking these arduous mountain trips, even if his general sense and judgment have not been benefited. On the contrary, it seems that we old sports get fooler and fooler as the years roll by.

In other words, nature has coquetted with us fellows so long that we have come to imagine that she loves us as well as we love her, and that a dream so sweet, so long enjoyed, can never, never be destroyed; and so we hang on like a puppy to a root, shutting our eyes to the consequences. What makes old age so sad is not that our joys, but that our hopes, cease.

However all this may be, Sept. 19, 1896, found four Portland sportsman: J. Roberts Mead, S. M. Mears, Jim Christy and the writer, not by accident, but premeditatedly and with malice aforethought, on board a Southern Pacific flyer bound for the happy hunting grounds about Mt. Jefferson in the Cascade range. We were to go first to Albany, eighty miles south; thence by the Oregon Central to its eastern terminus, Detroit, some sixty miles; thence find our way as best we could to Waldo Lake, somewhere up in the mountains fifteen or twenty miles northeasterly. Christy and Mears had only a month before returned from the headwaters of the Clackamas by way of Waldo Lake, and while their ideas were not of the most definite character regarding the way back to that country, and while each seemed to regard it as his bounden duty to antagonize the other's views and opinions about every other possible proposition, there was a pleasing if not rather remarkable unanimity in their expressions regarding the bounteous game and fish possibilities of the Waldo Lake country. Mead and I had it for breakfast, dinner and supper, and the fact that a proposition had been presented about which these two worthies fully agreed dispelled all doubt in our credulous minds.

We had left Portland soon after daylight in the morning and arrived at Detroit as the shades of night were settling down and over the "roaring Santiam." A wonderful country this! but then all mountain countries are wonderful, and one never tires of the kaleidoscopic phantasmagoria which nature delights here to present. But the Santiam, even in this country of wonders, is known far and wide as the "roaring Santiam," which of itself raises the presumption that it is rather unusually large and weird.

The end of telegraphic communication is at Gates, twenty miles short of Detroit, which indicates something of the character of the country.

You know it is a pretty ambitious railroad these days that can go where a telegraph line cannot accompany it. A railroad that can stick to the Santiam for fifty miles right up into the Cascades ought to be well sudsidized, for it is not likely to be very well patronized. But some day this line will push on through the great Cascades and become part of a great continental line which will need no subsidy.

My hair seemed to sit up a little uneasily at some points on the road, and I am quite sure that it doesn't come up on as small provocation as it used to. I asked the conductor about accidents on the road. "Oh, yes," he replied, "we have accidents every now and then, of course, but we fellows have got out without a scratch so far. The other day the jar of the engine brought down a cliff upon us, mashing the engine all up, but we fellows didn't get hurt." After a pause he added: "The great danger isn't so much from rocks as from trees. They start down from somewhere over in Clackamas county, I guess, and when they get down here they knock this railroad into a pretzel, I tell you, and we have to make a report to headquarters." All this was encouraging to a nervous temperament. I relapsed into silence, mentally soliloquized upon my past deeds and misdeeds, and wished that the infernal old engine wore moccasins, and that the peregrinating Clackamas trees would be "chained to business" at home, for that day at least. Resignedly I awaited our arrival at Detroit, or the arrival from Clackamas county, as the case might be.

But we reached Detroit all right. We knew that we were there, for the engine whistle had blown long and loud and we had come to a full stop.

I wonder if the hotel proprietor at Detroit properly appreciates the value of whistles in his business and feels duly thankful to the inventor. It was the whistle more than anything else that convinced our crowd that we had arrived at Detroit. We looked out of the car windows at the roaring Santiam on the right and the hurricane decks of the lofty mountains on the left. Then we looked inquiringly at each other.

The engine had cut loose and hitched up a rod or so, as if just a little bit ashamed to be caught asleep in company with the solitary, dilapidated, superannuated appendage occupied by us, and all hands seemed to have taken to the woods. Nevertheless we found an excellent supper awaiting us, and later on we found good beds—all but Christy.

The supper suited him all right enough, but he was touchy and finical about little things he found in his bed to an extent hardly becoming so thorough and accomplished a mountaineer. When reminded of this weak spot in his otherwise manly character he roared out the rejoinder that he would rather fight a bear by day than a bug by night. This fighting business is simply a matter of taste, and Mears, just to be contrary of course, said that he preferred to exhibit his courage at the hotel and would take his in bugs. Mead and I, accustomed as we were to the attacks of the Molalla experts, paid little attention to these rural amateurs. We are still ready to back the Molalla fleas and bugs.

Of course the hotel was crowded to overflowing with timber men, cruisers and the like, and the evening was spent in a general discussion of the Waldo Lake country. To the best of my recollection, no two agreed about the distance to the lake, its size, or the best way to reach it.

It is doubtful whether two men in the room outside of Mears and Christy had ever seen the lake, but there wasn't one in the room that couldn't, in his own estimation, give all the rest cards and spades on any proposition concerning it. A Mr. Fox, an elderly, observing, quiet gentleman, had helped to survey the west line of the Warm Springs Indian reservation, and undoubtedly knew more about the lake country than all the others combined, except Christy and Mears. Neither of these gentlemen took issue with Mr. Fox on any important point, for obvious reasons; but they made it very tropical for each other, and as they both insisted that they never made a mistake in their lives, and each entertained a diametrically opposite view of the situation in all its details from that entertained by the other, we were treated to a marvelous exhibition of linguistic landscape painting which none enjoyed better than Mead and myself. He and I were treated as ignorant noncombatants, and we quietly absorbed the doubtful benefits.

Now, if there is any one particular thing that Christy plumes himself upon it is his Irish ancestry, and if there is any one particular thing that Mears dearly loves to taunt him about it is that same. So it need not be surprising that the philological wind-up, or, as they say in pyrotechnics, the final piece, arose out of this fact. A question had arisen, been heatedly discussed and finally submitted to Mr. Fox for decision. Mr. Fox decided the vexed question in Christy's favor and braced his decision by some reference to a gentleman with him at the time he made his observations. The temptation was too strong for Christy and he jumped to his feet and proudly exclaimed: "I'll bet that that man was an Irishman." Of course all eyes were turned to Fox and he felt called upon to say something, and he mildly answered: "No, he was a white man!" To say that Mears rolled upon the floor in exultation would be an insult to his dignity, but we all thoroughly enjoyed the situation except Christy and poor Fox. The latter readily perceived that he had made a box of it and added, in his quiet way: "I am an Irishman myself, boys!" The blaze in Christy's eyes died down, the laughter subsided and all went to bed in good humor.

Natural History.

MARTHA'S VINEYARD HEATH HEN.

HAVING visited Martha's Vineyard every season during the past twelve years, and during the time spent there a large portion has always been devoted to my rod and gun, I will endeavor to give such information as I possess in reply to the inquiry of Mr. Ames in FOREST AND STREAM of Sept. 12, as I have failed to notice any answer thereto save the concise and interesting one by the editor.

Opportunities to observe the habits of the heath hen were more frequent several years ago than they are at present, but I seldom took notice of the birds then, except that when they were startled by the roadside I would mentally calculate the chances of success or failure to bring them down with a gun. During the past five years, since the ruffed grouse became more abundant and inclination directed my footsteps to the field rather than to my boat, I realized that the bird was rapidly becoming extinct, as I could not fail to notice while walking or driving that fewer and fewer of the birds were seen in each succeeding year.

I frequently took my dogs for company on a Sunday, and selecting some old, unused wood road, have followed it to that part of the island locally designated as the "plains," the home of the heath hen.

Arriving at an open spot, the dogs would be ordered to "get away." With a bound they obeyed; with head high in air and every evidence of enjoyment they ranged as wide as they could see the signals given for their direction. A point would sometimes be rewarded by the starting of a belated woodcock apparently out of his element; but frequently the heath hens were found. As they lie very close for the dog, it was an easy matter to approach very close, where I would remain several minutes to observe their actions—as long as I considered prudent for the patience of the dogs. When they were flushed away they flew, generally alighting together an eighth of a mile or so away. The growth in the more open country consists of huckleberry and sweet fern bushes, wild cranberry and checkerberry vines. The heath hens are extremely fond of the cranberries and checkerberries.

The larger part of the plains is covered with a tangled growth of scrub oak from 3 to 20ft. high and is almost impenetrable, in which the heath hen takes refuge when pursued too closely.

One Sunday afternoon nearly four years ago I took those then well-known pointers Spot Dash and Belle Randolph out for a run, following a neglected path for a mile or more. Suddenly I was confronted by one of the dogs pointing directly in my path. The attitude and suddenness of the action left no doubt that the birds were very close; but I failed to see them, although the scattered sweet fern and golden rod afforded scanty cover. Advancing slowly, I flushed them scarcely 20ft. distant—nearly a dozen of them, their plumage matching their surroundings so closely as to escape detection.

During the afternoon I had an opportunity to see pointers' work such as I have seldom seen, the open country enabling me to observe their every motion, which was the personification of canine beauty and strength; their foam-flecked mouths, rigid muscles and the exquisite grace of their posture making a picture that could not be transferred to canvas. Possibly I may be pardoned for the thought that I wished for—the possession of my Lefever and a change in the game laws for the moment. Nevertheless that bright October afternoon will always be remembered as one of the most enjoyable in my memory. Possibly we flushed fifty or more heath hens, in most instances in flocks of from five to ten birds.

During the same year, while hunting the ruffed grouse some distance away, I shot two birds, which on examination proved to be heath hens, though they seldom inhabit the heavy timber, and I presume they had forsaken their home on the plains for the shelter of the forest.

The birds were given to a friend, who had them mounted.

In coloring, the heath hen is considerably darker than the pinnated grouse; the legs are feathered less, and, if I remember correctly, comparison indicated fewer feathers in the tail. The flight is the same as with the Western bird; there is no decided whir-r-r, such as the ruffed grouse has when started. The heath hen is indigenous to the island probably, not an importation, nor have any pinnated grouse been liberated to the knowledge of the residents. I have heard well authenticated stories of the bird's existence here from the time of the early inhabitants, and gentlemen with whom I have talked well remember the tales of its abundance as related by their ancestors; also when the first law was passed for their protection; again when it was rescinded and an open date of ten days allowed, which law lasted but a short time.

A few weeks ago, after reading the article within referred to, I took the train for the Vineyard, accompanied by my pointer Kentwood, with the idea of getting some fresh information; and though I searched the grounds thoroughly, or such portions as I considered the best, I saw no evidence that any of the birds remained, though friends who are residents of that section (than whom none are more mindful of the game laws) tell me that occasionally one is seen, where but a few years ago they could be found in almost any of the roads leading to the southern part of the island. Year by year the flock has diminished, until now but a remnant of it remains. I am in doubt as to the cause, though I am aware that the heath hen is hunted by gunners who, while pretending to be out for rabbits, are always accompanied by a setter.

It is a sad commentary on the avarice or thoughtlessness of the sportsmen that this noble bird, the finest game bird in New England, should be allowed to pass into oblivion, which will surely be its fate before many years. I doubt if there are 100 heath hens on the island at the present time.

I noticed with pleasure on my last trip the rapid increase of the beautiful pheasants placed on the island through the generosity of one of the residents, and provided they are properly protected we shall have as suitable a substitute as could be found for the Martha's Vineyard heath hen. KENTWOOD.

We quote from Audubon's "Ornithological Biography" the following interesting letter describing the heath hen on Martha's Vineyard; it was written to Audubon by his friend David Eckleiy:

"*Dear Sir:* I have the pleasure of sending you a brace of grouse from Martha's Vineyard, one of the Elizabeth Islands, which for many years past I have been accustomed to visit annually for the purpose of enjoying the sport of shooting these fine birds. Nashawenna is the only other island of the group on which they are found. This, however, is a sort of preserve, as the island being small and the birds few, strangers are not permitted to shoot without the consent of the owners of the soil. It would be difficult to assign a reason why they are found upon the islands above named and not upon others, particularly Nashann, which, being large, well wooded, and abounding in feed, seems quite as favorable to the peculiar habits of the birds.

"Fifteen or twenty years ago, I know from my own experience, it was a common thing to see as many birds in a day as we now see in a week; but while they have grown scarcer, our knowledge of the ground has become more extended, so that the result of a few weeks' residence of a party of three, with which I usually take the field, is ten brace of birds. Packs of twenty to fifty are now no longer seen, and the numbers have so diminished, in consequence of a more general knowledge of their value—the price in Boston market being $5 per brace—that we rarely see of late more than ten or twelve collected together. It is often observed, however, that there is very little encouragement to be derived from the circumstance of falling in with a large number, and that the greater the pack the more likely they are to elude the vigilance of the sportsman; though it must be acknowledged that it is a most exhilarating yet tantalizing sight to start a large pack out of gunshot. To watch them as their wings glisten in the sun, alternately sailing, fluttering and scooming over the undulating ground, apparently just about alighting, but exerting their strength and fluttering on once more, some old stager of the pack leading them beyond an intervening swell, out of harm's way, beyond which all is conjecture as to the extent or the direction of their flight; in such a case it is best to follow on as quick and as straight as possible, keeping the eye fixed upon the tree or bush which served to mark them, and after having proceeded a reasonable distance in the direction which they should have flown, if a clear or cutting place should lie in the course, the birds may be confidently expected to have alighted there. They never in fact settle down where the woods are thick or the bushes close and tangled, but invariably in some open place, and often in the roads; neither do they start from thick foliage or briary places, but seek at once to disengage themselves from all embarrassment to their flight by attaining the nearest open space, thus offering to the sportsman the fairest mark of all game birds. It frequently happens that not one is killed on the first flight of a pack, as they are often very unexpectedly started, but on approaching them a second time with greater caution success is more likely to follow, particularly if they have become scattered.

"Toward the middle of November they have attained their average weight of nearly 2lbs. each, and nothing can be fuller, richer or more game-like than their plumage. At this time of year, however, in sportsman's phrase, they seldom 'lie to the dog,' but are easily started by every sound they hear. Even loud talking alarms them, for which reason a high wind, which drowns the approach of danger, is the most desirable weather. A calm, drizzly day is also favorable; for the birds, being less likely to be disturbed by the glare of objects, venture into the old rye fields, the low edges of the wood and the bushy pastures to feed.

"It is seldom that we start a bird a second time in the exact spot where he has been seen to hover down, for no sooner do they alight than they run, and frequently into thick cover, from which they often attempt in vain to disentangle themselves. A dog is then necessary to scent the bird, which alternately runs and squats, until, being hard pressed, it rises, and frequently with a sound which resembles the syllables *coo, coo, coo*, uttered with rapidity. One good dog is better than two, and, though sufficient, is absolutely necessary; for, besides the enjoyment of observing his action generally, his challenging cheers and his pointing prepares you. But more than all a dog is required in recovering those which are winged or not fatally wounded, which but for his tracking them would be entirely lost.

"The barberry, which abounds in many parts of Martha's Vineyard, is the principal food of the grouse, particularly such as grow on low bushes, near the ground, and easily reached by the birds. They also feed on the boxberry or partridge berry, the highland and lowland cranberry, rosebud, pine and alder buds, acorns, etc. In summer, when young, they feed on the more succulent berries.

"We frequently meet with the remains of such as have been destroyed in various ways, but more particularly by the domestic cat, which prowls the woods in a wild state, and which often receives a very unwelcome salute for the mischief it does. Owls, hawks and skunks also do their part toward the destruction of these valuable but defenseless birds. In these ways they are thinned off much more effectually than by the sportsman's gun. They frequent no particular soil, and, like all other hunting, wherever the feed is there is the likeliest place for the game. In addition to this rule as a guide, we look for their fresh tracks among the sandy barberry hillocks and along the numerous paths which intersect that remarkable part of the vineyard called Tisbury Plain. Into this, should the birds fly from the edges, as they sometimes do, it is almost impossible to start them a second time, as there are no trees or large objects to mark their flight. Being mostly covered with scrub oaks of a uniform height, with occasional mossy hollows, it affords them a place of refuge into which they fly for protection, but from which they soon emerge, when the danger is past, to their more favorite haunts.

"I have only seen them in the month of November, but I am told that in the spring of the year, previous to the season of incubation, they congregate in large companies in particular places, where they hold a grand tournament, fighting with great desperation and doing one another all the mischief possible. In these chosen spots, it is said, the cunning natives were accustomed to strew ashes, and rush upon them with sticks when blinded by the dust which they had raised. In later times the custom of baiting them has proved more destructive to the species. In this way very great but very unsportsmanlike shots have often been made. Another practice has been that of stealing upon them unawares, guided by that peculiar sound for which they are remarkable in the spring of the year, called tooting. By these and other means, to which I have adverted, the birds were diminishing in numbers from year to year; but it is to be hoped that they will revive again, as they are now protected by an act of the State of Massachusetts, passed in 1831, which limits the time of shooting them to the months of November and December, and imposes a penalty of $10 each bird for all that are killed except in those two months.

"BOSTON, Mass., Dec. 6, 1832."

DEER AND LILYPADS.

LANSING, Oct. 16.—*Editor Forest and Stream:* In your issue of Oct. 10 I note the remarks of Dr. Henry Skinner, of the Academy of Natural Sciences, of Philadelphia, to the effect that he has seen miles of lily stems sticking out of the water, and that the lilypads had been snipped by deer. Also that he had seen deer swim in the water and eating the lilypads as they went along. If Dr. Skinner has seen what he says he has, he has seen what no other man ever saw before, and what no man will ever see again. No man ever saw miles of lily stems sticking out of the water, or ever saw a lily stem sticking out of the water and could say positively that a deer snipped off the pad. When a deer accidentally breaks off a stem he does it down under the water, and when he is feeding on the water weeds that grow among the lily plants never snips them off on top of the water. No man ever saw a deer snip off a lilypad or break off a stem on top of the water purposely. When a deer accidentally pulls off a stem he will show at once that he has something in his mouth that annoys him and he wants to get rid of it, and he will spit it out just as soon as he can. He may chew it a little, particularly if he also has some weeds in his mouth at the time that he likes, but he never has a stem, or pad, or any part of the lily plant in his mouth without some other article of food is taken with it; and he will not swallow the lily plant or any part of it, but he will separate the stem from the other food he has in his mouth and he will spit out the stem or pad just as soon as he can get it out.

As to deer being able to swim in the water and snip off the pads as he goes along—well, such a statement is too absurd to even call for an answer.

When lilypads are in a condition to be snipped off, the deer is in his short coat, and when he is off his feet in the water he has something else to think of besides feeding. He has all he can do to keep his head above water.

No man ever saw a deer swim and snip off lilypads as he went along. Such a thing is an absolute impossibility. Late in the fall, when the coat of the deer is fully developed and the hair long and thick, he can float to a certain extent, but not enough even then to enable him to feed as he swims along; and at that time of the year nature has nipped the lilypads so closely that the deer, even if he was so inclined, could not find a lilypad in going a hundred miles.

There are many things in this world which pass for facts, but which have no foundation whatever, and one of the greatest errors is this mistaken notion about deer eating lilypads. If one should say that the deer feed among the lilypads, that would express the matter as it actually is; but to say that deer eat lilypads or any part of the lily plant is misleading and such a statement is not correct. JULIAN.

BOSTON, Oct. 22.—*Editor Forest and Stream:* I notice in your recent issue a communication on "Deer and Lilypads." I think I might as well set that matter right. Deer do not eat lilypads, but they do eat the tuberous root of the water lily and are exceedingly fond of it. They put their heads down under the water and pull up, not, as suggested by the writer of that article, delicate leaves and sprouts, but the root of the lily. That is why you so often see a lilypad hanging from the mouth of a deer; they are separating it from the root. I have very frequently during the past summer started deer from the water among the lilypads and found a dozen or more roots which it had secured from the bottom floating on the top, some of them being bitten in halves. I had the curiosity to taste one of these roots and found it was exceedingly acrid, almost as much so as alum. I know the pucker remained in my mouth for an hour. My guide told me at the time that a man was lost in the woods a year before, and that he had subsisted for three days on these roots. Therefore there must be considerable nourishment in them. I think this will explain the movements of the deer mentioned in the previous article. C. S. COOK.

NEW YORK, Oct. 17.—*Editor Forest and Stream:* I have usually examined the stomach contents of deer killed by myself or by friends in the same camp. In the late summer or early autumn I have found the paunch to contain large quantities of the leaves and stems of various water plants, among them the leaves and buds and flowers of the yellow water lily, but chewed so fine that it required a rather close examination to determine the species. The lilypads when finely masticated turn an unnatural brown color, but even the little bits of pieces show the peculiar glaze of the under surface of the leaf. The largest fragments of food that I have found in any deer's stomach were halves or quarters of leaves of the striped maple and mushrooms. ROBT. T. MORRIS.

The Call of the Pintail.

BROOKLYN, N. Y.—*Editor Forest and Stream:* I note what Buckshot says about the call of the pintail. This is a duck of which I know little in a wild state and I asked for information about their calling. I kept them in confinement for years and bred them, but only once did I hear a sound from them, and I was not sure then but it was some other duck that made it, for I had many species. I could not say now what kind of a sound it was, and Buckshot does not say.

I note what he says about call ducks. If he had some of those which I used to breed he would be surprised. None of our wild or tame ducks are such persistent callers as these little pets that are bred in Holland. I don't know of anyone who has them now; my stock went to Georgia and were killed by mink. They are valued as bantam fowls are, the smaller they are the more they are prized.

I did not know but the pintail might be as silent as the giraffe, which never makes a sound of any kind, at least not in confinement. FRED MATHER.

Game Bag and Gun.

Our readers are invited to send us for these columns notes of the game supply, shooting resorts, and their experience in the field.

PARTING SHOTS AT MAINE MOOSE.

BANGOR, Me., Oct. 23.—*Editor Forest and Stream:* When the Maine Legislature meets next January it will be asked to put a close time on moose for ten years. The men who make the demand for such a law are the foremost hunters, guides and naturalists in the State. They have discussed the matter among themselves and through the papers for a number of years, and have come to the conclusion that moose will soon become extinct in the Maine woods unless stringent laws for their protection are enacted at once.

The reasons presented in favor of such legislation are powerful, and of such a nature as should demand immediate attention. Except during the two years between 1891 and 1893, it has been unlawful to kill cow moose since away back in 1877. The belief was that, as the bull moose are polygamously inclined, they could be killed freely without endangering the production of offspring. While the law was enacted for the purpose of maintaining a supply of these lordly animals, and while it looked all right in theory, its practical application has been followed by many disappointments.

The first object of the hunter who goes to the woods for large game is to get a set of moose antlers which he may keep as a trophy. Moose hunting is no doubt a lordly sport, but no one can make complaint against the pleasures of shooting deer or caribou. Even the much-praised moose steak, while good as a bill of fare oddity, cannot compare with beefsteak for a steady diet. For these reasons the antlers are the most prized portions of the moose. As cow moose grow no horns of any kind, the bulls have been patiently and persistently hunted in Maine for many years. Another reason why bull moose of more than two years of age are getting scarce in Maine is that all the large males can be called in the love-making season, at which time they lose all fear, and rush out to give battle to railroad trains or anything that is capable of locomotion. Of the 1,000 or more bull moose that were slain in Maine last year more than one-half were lured to their destruction by guides who called them with birch bark horns. Of the remainder nearly all were still-hunted by tracking them on the snow of December.

Men who are familiar with the habits of big game have noticed that large male moose have been growing scarce for several years. As soon as they said so in print, however, the railroads that looked for travel, the hotels which sought guests, and many of the guides who needed paying employment, all came forward and said that moose were gaining in numbers every year. The legislators, who formed their opinions from a majority of witnesses rather than from the facts in the case, voted as the railroads and hotels desired, and the killing of moose was unchecked. No one can tell how much the moose herds of Maine are endangered by the present law, though the evidence of a few men who ought to know may assist one in forming a conclusion.

Dr. G. Gilmore Weld, ex-mayor of Old Town, Me., has been a devoted hunter from boyhood, and has passed nearly half of his life in the woods. In December, 1892, he dissected eleven cow moose that were brought down by hunters, and of these only four had promise of producing offspring in the spring. If the same ratio held good throughout the Maine forests—and there is no reason why it should not—nearly 70 per cent. of the females were

barren from killing off the males. During the past summer Game Warden Cummings, of Presque Isle, Me., has spent most of his time between the mouth of the Allegash, on the St. John River, and Chamberlain Lake, 150 miles away in the Maine woods. Moose are said to be more plentiful here than in any other part of the world. Of the nearly 500 moose counted by Mr. Cummings between June 20 and Oct. 1, he did not see over seventy-five males, and half of these were yearlings. Bela Fowle, of Milo, one of the oldest and most experienced guides in Maine, has seen herds of from fifteen to thirty moose this summer, and there was seldom a bull among them. Other good guides, who care more for truth than they do for getting money by practicing deception upon their patrons, complain about the scarcity of large male moose; and they say that moose hunting will soon come to an end in Maine unless more stringent laws are passed.

Two years ago of the 10,000 men who sought moose in Maine about one in forty captured the game he sought. Of the nearly 18,000 men who hunted moose in Maine last year not one in fifty saw what he wanted to kill. It is estimated that about 25,000 hunters will seek moose in the Pine Tree State between Oct. 1 and Dec. 31, 1896. Ninety per cent. of those who passed a week or more in the woods in October returned home to tell their friends that nobody can kill a bull moose in Maine while the ground is bare.

GROWLER.

CHICAGO AND THE WEST.

The Wisconsin Deer Law.

CHICAGO, Ill., Oct. 23.—Rarely have sportsmen's circles in this part of the country been more excited than they have this past week over the sudden news of the change of the Wisconsin game law. This change cuts down the possible shooting season on deer in 1896 to seventeen days total, and that a month earlier than had been fixed upon by hundreds, and indeed probably thousands, of deer hunters for a trip into the Wisconsin woods. By all odds the story of this singular state of affairs is the most important sporting news of the season. The facts were mentioned briefly in these columns in last week's FOREST AND STREAM, nothing definite at that time being known by anybody as to what would be the result of the tangle made by this sudden and unannounced action of the Supreme Court of that State. Day by day since then the interest in the news has grown, and meantime very many letters have been received at this office asking definite news as to what will be the legal deer dates in Wisconsin. I am now in position to give authentic and thorough statement of the case, and also to show something of the extent of the annual migration of deer hunters to Wisconsin, a traffic which will this year be cut down probably one-half at least.

Game Warden J. T. Ellarson has published a circular giving the status of the game laws since this decision of the Supreme Court, and in his circular says that the wardens will stand on the dates of the law previous to the law of 1895, namely, that of 1893, in which the deer season is Oct. 1 to Nov. 1. To avoid confusion in regard to dates of open seasons on other varieties of game, the dates given by Warden Ellarson are here given: Deer, Oct. 1 to Nov. 1. Brant, Sept. 1 to May 1. Grouse, goose, mallard duck, partridge, prairie chicken, plover, quail, snipe, teal duck, wood duck, woodcock, Sept. 1 to Dec. 1. Duck (other than mallard, wood and teal), Sept. 1 to May 1. Rabbit (with dogs), Nov. 1 to Oct. 1.

How the Trouble Happened.

The manner in which the blunder over the Buckstaff law (or the law of 1895) occurred is thus set forth in a letter from Col. H. B. Harshaw, of Oshkosh, who had the interests of that law in charge in the matter of execution at Oshkosh and other points, and was well advised of the intents of the law and instrumental in its passage. From Col. Harshaw's clear exposition of the case it looks certain that the deer will get a good chance in Wisconsin this fall, for the season will be up Nov. 1. The Supreme Court will not reconsider in all probability. What the results will be for the sportsmen who were diligent in the enforcement of the Buckstaff law in good faith during the time it was considered the law of the land will make a very interesting study in law. The fishermen have been very vindictive against the sportsmen for confiscating their nets and breaking up their illegal and pernicious traffic in the game fish of Winnebago and other large lakes of the State, and it is sure they will attempt retaliation by damage suits for loss under the late prosecutions. The sportsmen interested in that should, however, not be troubled in mind yet awhile, for the whole affair is apt to end in bluster, and it is sure the courts would be very lenient with the sportsmen if any such case came up, for there was no intent or supposition of any illegal action on their part, and the law had never before been tested or passed upon in any way. The fishermen will not do much by way of retroactive revenge, and the sportsmen will soon be after them again with another and better law. Anyone acquainted with Mr. Buckstaff and Col. Harshaw will hardly expect them to quit the matter at this interesting stage. Col. Harshaw writes as follows:

E. HOUGH, ESQ.—*Dear Sir:* Answering yours of yesterday regarding the decision of the Supreme Court handed down on the 13th, whereby they hold that what we had supposed to be our fish and game law of 1895 had never passed (legally) the Legislature, and was therefore a nullity, I would say that I have very little hopes of the court changing their decision. Should they do so it would come too late to be of any avail this year.

You ask for my views on the present tangle of the Wisconsin game law and any light I can give you on the matter. Our Supreme Court held in February of this year that the law was constitutional, and that the Legislature had the power to pass same and provide for its enforcement, the question as to whether the law had properly passed or not not being raised in that case. Another case was subsequently appealed to that court on the question as to whether the printed law ever legally passed, and they decided as above stated.

The whole blame for the failure of the bill to become a law lies with the Senators who were respectively chairmen of the Committee on Fish and Game and Enrolled Bills. A bill that did not pass both houses was enrolled, certified to the Governor and approved by him. A portion of another bill which did pass was certified to him and also approved. The bills contained a repealing clause of all prior game laws passed. This being no law leaves the game law of 1893 in force. By the law of 1893 the open season for shooting deer is Oct. 1 to Nov. 1, and, as I understand, will be enforced. This gives the deer this year the benefit of thirteen days.

Beyond any doubt the Legislature will pass a law substantially the same as the 1895 law. As soon as that law was passed the people adjacent to Lake Winnebago took its enforcement in hand. We had wardens appointed, and the State having made no appropriation for paying any expenses of enforcing same, raised money for payment of deputies, hired a steamboat and enforced the law vigorously from June, 1895, to Oct. 13, 1896, taking and destroying nearly if not quite 100 miles of nets and many thousands of set hooks and lines. The result was the best fishing in these waters with hook and line for the past ten years.

The rivers and lakes are now filled with nets, and thousands of pounds of fish are being shipped from our waters every day and will be until we can get a new law. When we get a new law you may be assured it will be a good and valid one, and it will be enforced.

OSHKOSH, Oct. 21. H. B. HARSHAW.

Extent of the Deer Travel.

Another very great factor in favor of the deer this fall is the fact of the Presidential election now so near at hand. I learn from the three great railroad systems which go from Chicago into the Wisconsin deer country that a very large number of parties—especially from Ohio and Indiana—had made arrangements to go to Wisconsin immediately after election. Many of these will now not go at all, as they are in the habit of going for the full season, and would not now have time to get ready and come back for election. So far as I can discover, all these different facts coming together will lessen the number of deer hunters at least one-half, and if more than that, so much the better for the deer.

The hunters who will go into Wisconsin this fall will be largely from points near Wisconsin. Chicago will send a good number. Of course, the resident hunters will not be so much affected. I think that there are probably at this writing about 2,000 deer hunters out in Wisconsin. There would be relatively about 4,000 this fall if the game law had not changed. The number will be increased to probably 2,500 before the end of next week. I do not think 3,000 to 3,500 is an outside estimate of the non-resident hunters who will go to Wisconsin each deer season now, since the Michigan license law. This estimate is far more apt to be too small than too large, but I make it conservatively.

The general passenger department of the Chicago & Northwestern R. R. tell me that they will send three parties, comprising twenty-one men, to Wisconsin next week. They sent ten Chicago men up Wednesday. They think Chicago alone will send from 150 to 200 deer hunters over their road this month. At the hurried opportunity given them to get at figures, they could not state positively much about their deer traffic this fall, especially as the matter was still in confusion, as they were answering telegrams and letters from all over the country in regard to the change in the law, which was widely spread by the daily press, in some respects incorrectly. The Northwestern road, however, state to me that they carried between 1,800 and 2,000 deer hunters, non-residents, over their road alone into Wisconsin last fall, and that almost all of these came from Ohio and northern Indiana. This sudden jump in deer traffic was the unmistakable result of the Michigan license law. The figures are authentic. A great many of these parties were large ones, and it was the custom of the road, in common with other railroads, to send special cars down into Ohio and Indiana for the accommodation of these parties, which ran from half a dozen to twenty-five men, usually under the leadership of some one acquainted in Wisconsin. The cars were sometimes "combination" cars, with a baggage compartment, so that the parties could be put through to their camping grounds without any change or trouble to themselves at all, taking their camp dunnage along at no expense or annoyance. The Northwestern folks say that this fall the State to have the deer traffic will be Minnesota, whose dates are Nov. 1 to Nov. 20. A large number of these Ohio parties have signified their intention of going out after election, crossing the State of Wisconsin and going into Minnesota, along the Duluth, Mesaba & Northern and the Duluth & Winnipeg railroads. Nov. 4 will see an exodus of probably 1,500 deer shooters from Ohio alone. A great many of these men are reported to be farmers, who make this fall hunt their big yearly trip and rarely leave home for any other sort of hunting. Of course, there are hundreds of others of all professions.

The Wisconsin Central R. R. reports a similar state of affairs to the above in its deer traffic arrangements for this fall. All the railroads deplore the misunderstanding regarding the law, as it costs them many thousands of dollars, all these parties being "long hauls" whose round trips figure up toward $20 apiece. One man, Phil Miller, of Eaton, Ohio, had a party of seventy-nine men made up to go to Wisconsin this fall immediately after election. He was in town this week bound North, and says that only three of his party came with him. The Wisconsin Central think they will lose about one-half their deer traffic this year. They carried about 300 men from Ohio last year, and expect 150 to 200 at the outside this year as it is. Their total last year was about 600, or at least they know they had that many, perhaps more. This year they expect not over one-half or a third of that number, from 300 to 450. The bulk of these men scatter out between Medford and Glidden, there being small choice for location in that region. Fifield receives much traffic of that sort, and is reported good.

The Chicago, Milwaukee & St. Paul R. R. is the third line which runs into the deer country of Wisconsin, and it carries a great many hundred men annually in this business. This month it reports knowledge of only about forty men who have gone up from Chicago. More are expected as the understanding of the case grows more general. This road does not expect over half its usual quota on this traffic.

The vicinity of the Gaylord Club catches a good many deer hunters, and another very popular point is Star Lake, to which the new spur of this road was extended two years ago, and where deer are accessible at reasonable distances. Many persons go in at Minocqua, Squirrel Lake and other points closer to the beaten paths, but where good deer country is near at hand. Manitowish, Turtle Chain and other localities are also good. Coon's Camp on Trout Lake is open for the deer season this year. The Bucks at Manitowish are no doubt ready to guide parties, and they are reliable men who will find game.

Snow in Michigan.

Deer hunting matters are still further complicated by a heavy snowstorm this week in the upper peninsula of Michigan, which it was thought might block railroad travel, 4in. having fallen at the time of the report, with more following fast.

The Express Companies Act.

The deer law matter has come to the notice of the express companies running to Wisconsin. The National Express Co. has a circular to-day in the hands of all its agents and also the railroad companies interested, advising all of the change of the law, and stating that the law of 1893 is now in force. The circular states that under that law no deer can be shipped or carried out of the State, whereas under the law of 1895, now nullified, two deer could be brought out in possession.

Deer Hunters Numerous in the Woods.

Under any ordinary circumstances it is no sinecure to go hunting for deer in the State of Wisconsin. There are a good many deer, but also a good many hunters, some of whom are the usual touch-and-go, hit-or-miss sort. I have stated that the death roll of victims of these hunters last year was thirteen, that many men being known to have been accidentally killed by deer hunters who took them for deer. Probably a great many more were killed whose deaths were never reported in the newspapers. Last year, between Iron Mountain and Champion, on a strip of country about forty miles long and half that wide, there were 500 deer hunters at one time. At least a railroad man told me he knew of that many who bought tickets for the points on that strip of country. There are a great many chances that a sportsman hunting deer in such a goodly company will not get killed. Indeed, the great majority of shooters who went in there were not killed, or even fatally injured or crippled.

One hundred men got off at the station of Rhinelander, Wisconsin, last Sunday morning, all bound for deer hunting, according to reports received here through a party of muscallonge anglers who have just returned from Wisconsin this week. They say that there is great excitement among the local hunters, and all are pressing into the woods.

This local traffic is to be added to the vast number of non-resident shooters, whose numbers I have tried to arrive at above. The grand total of deer hunters out in Wisconsin during the deer season is something which is hard to get, and outside these columns I have never seen it attempted. With the help of the railroads, as above quoted, I should say there may probably be 5,000 to 6,000 men, residents and non residents, who hunt deer in Wisconsin. This is in the legal season. Not all these men hunt legally by any means. Many of the large Ohio and Indiana parties take in dogs with them openly. It is known by the railroads that the non-resident hunters nearly all—I will not say all—smuggle out venison wrapped up in the tents or baggage when they go home. The railroad men tell me that they do not think the hunters average a deer apiece, though some parties of good hunters kill twenty, thirty or forty deer in the season, sometimes two or three dozen men hunting with various luck for a week or two weeks, rarely for a less time.

On top of this influx of shooters, who shoot in legal season and with more or less regard to legal methods, there must be added the large amount of illegal shooting practiced by local shooters all through the summer, and by city parties of fishers who take in rifles as a matter of course. The game laws in Wisconsin are not as well observed as they are in Maine. I am not familiar enough with that State to know how the amount of hunting territory or the number of hunters compares with the same in Wisconsin, and I do not know how the deer compare in numbers; but it seems to me that the big and hospitable Western State might well take counsel of its Eastern sister and begin early to look sharply after its game. I do not think the case is much the same in the two States as to revenue from non-residents. Nearly all the big parties I have mentioned are camping parties, and these do not spend much money in the woods region. The local storekeepers complain that they do not even buy bacon or ammunition of them, and many local men complain of the non-residents on one ground or another, whereas in Maine this sort of travel is much sought and valued, and makes a regular and well estimated source of revenue to many men aside from those of the railroads. There are guides in Wisconsin, but not so many as in Maine, and the guiding industry is not cultivated to the same extent. I should take the character of the Maine trade to be largely of city men with money, and that of Wisconsin to be made up more of men who do not care to spend $1,000 for a deer, but who like to kill and eat one just the same. As times go by the condition in Wisconsin will come more and more to resemble the condition in Maine. It is wilder and less regulated in the Western State. I confess it never seemed attractive to think of being tagged and checked all through the woods, as they seem to do with a fellow in Maine; but after a while we will do that out here. I think a good system of tags should be established for Wisconsin. I would not think of going into Wisconsin myself without a serviceable metal tag made of some non-corrosive material attached to my person, which would serve as a means of identification for my remains if found a year or so later. As to the deer, in either Maine or Wisconsin, it seems obvious that they would better learn how to climb trees, for they will have to get off the earth if they stay on the ground. Yet so far as can be learned at this early writing, the wily white-tail is taking care of himself so carefully as to be as abundant this year as it was last in some parts of the State of Wisconsin.

Michigan License.

There are several Chicago gentlemen who pay their license and go to the Michigan south peninsula this fall, thinking the hunting will be better there. One party of four, whose names I could not get at the time, will leave this city together for the south peninsula. The number of non-residents will, however, be very small in Michigan this year. As Wisconsin has no license law, it will be interesting to compare the game supply in the two States during the ensuing years, and perhaps additional light can in this way be obtained, though all such comparisons are more or less vague and unsatisfactory, and only to be arrived at in the most general form. I have no advices as to how the license law of Michigan is liked by the local hunters, but it certainly is cordially hated by the non-resident hunters. Meantime there are some thousands of men who wish this week that the date of election did not conflict with the date of deer.

Notes of the Shooters.

Messrs. J. A. Kline, H. Kline, C. Hess, G. Wertz and W. F. Williams, all of Youngstown, O., called at the FOREST AND STREAM office this week on their way to Conover, Wis., where they will hunt deer for the remainder of the season.

Messrs. F. S. Wheeler and C. E. Rollins, Jr., of Chicago, with their friends Messrs. Johnson and Gobel, also of Chicago, started yesterday for Minocqua, Wis., for a deer hunt.

Mayor Swift, of Chicago; Corporation Counsel Beale, of Chicago, and Mr. Robt. Summerville, of the same city, also started yesterday for the Gaylord Club, of Wisconsin, for a deer hunt which will last several days. A number of other gentlemen go into the same neighborhood, which is near Wasusaukee, on the Pike River.

Mr. C. N. Souther, of the Milwaukee and St. Paul Railroad, with his friends, Prof. J. H. Long and Mr. C. B. Wright, all of this city, started Friday for a duck shooting trip to the big marsh near Lauderdale Lake, a few miles from Elkhorn, Wisconsin. There are several lakes in there which offer a combined shore front of thirty or forty miles, with a big extent of marsh adjoining. This is the first marsh below Koshkonong Lake on the line to the Fox Lake district, and Mr. Souther has it figured out that there ought to be some game in there, although he says there does not seem to be much hunting in that locality. He and his friends will explore and report results.

Messrs. J. L. Jones, J. C. Corbet and Bob Bruin, of Chicago, and their friend, Mr. John Howley, of New York, this year made their annual chicken hunt with very poor success. They went to Minnesota, above Crookston, and in nine days' shooting only got forty birds. The local shooters said that the spring had been too wet, so that the birds were drowned out. Yet one young man admitted that he had gone out before the opening of the season and killed seventy-two birds one day. The shooters found the birds scattered and broken up, a cock here and a stray bird or so there, but had no real shooting.

Sheriff James Pease, of Cook county, left this week for a ducking trip to the Poygan marshes of Wisconsin, where there should be some shooting unless it be true that the ducks have moved further south. No good bag of ducks reported anywhere this fall so far as I can learn.

Mr. Harry Loveday, of Chicago, and his friend Mr. E. Hughes, of Chicago, are absent in Minnesota hunting ducks. They are in Ottertail county, where at times the shooting is very good even in these days among the many lakes and marshes of that favored region, but they send back word that they have had no sport to mention and believe the ducks are south of them. They report the weather very warm this week.

M. J. Carl Hunt, of Elmira, N. Y., who is at present visiting with relatives here, is back from a duck trip to Big Stone City, South Dakota. He says he shot in his shirt sleeves for two weeks and had no shooting of much interest, getting only a few ducks and no snipe at all. He did not know where the birds were, but the weather was not right for finding them where he was. There were a good many geese in there. The water shut up there very suddenly in the cold snap and he thought the season was over.

Mr. Dorsey Burgess, of Spokane, Wash., is in Chicago visiting friends and acquaintances. Mr. Burgess says that there is a bit of exceedingly good wildfowl country about 125 miles northwest of Spokane in the Grand Coulee country, which is a desolate corner of the world, a good way off from anywhere. The Grand Coulee is a vast scooped-out river bed, once thought to be an old bed of the Columbia River, but now declared to be a glacial channel. In this strange country there is a river which comes up out of the ground, runs ten miles and then disappears, after making a good water course and establishing a big marsh. Here the ducks and geese breed in vast numbers. Mr. Burgess says that he and a friend once got in there, and had more shooting than they cared to take. It is a very remote section, and no use could be made of the birds.

Mr. J. D. Suggs, of Sugden, Indian Nations, is in the city. Mr. Suggs is one of the best known cattle men of the Nations, and he and his brothers have been engaged in ranching practically all their lives. At one time their ranch was the center of a magnificent game country, one probably never surpassed on the continent for deer and turkey. Then the railroad came through, and within the last five years the game has been wiped up completely. Mr. Suggs told me there was not a deer nor a turkey to be bad in his entire part of the Nations, about 100 miles north of Ft. Worth, Texas, in the southeast corner of the Nations; and says that the only game left is the quail, which continue abundant.

Mr. A. E. Cook, of Odebolt, Ia., is in Chicago this week outfitting for a long trip through the West, in which his wife accompanies him. He will be out six months, and will visit Texas, California and Oregon.

Messrs. C. S. Dennis, Geo. B. Walker, Frank and George Wells are back from their long trip after muscallonge in the Manitowish waters and vicinity. They took a great many fine fish, and had sixteen 'lunge which averaged 17lbs. Several of their fish went over 20lbs., and they returned to the water all fish under 12lbs. They report magnificent sport.

Better Water in Wisconsin.

The rains of the season have raised the water in the Northern Fox River, of Wisconsin, so that the mill men at Menasha now have all the water they need and to spare. The U. S. Government was very rigid during the low water season, and strictly enforced the saving of the water for navigation purposes. The Fox is now, by reason of the Government improvements, navigable from Green Bay to Portage, and there are fishways in all the dams. The low water of last season was unprecedented in the State of Wisconsin.

Animals for the Washington Zoo.

Billy Hofer, the Yellowstone dweller, well known in these columns as guide and correspondent, is also well known as field agent for the National Zoölogical Gardens, of Washington, D. C. His story of how he caught the beaver alive is about as good stuff as ever got into the paper, and he always has meat in what he writes about the Western country and its game. Mr. Hofer writes me now that he is just back from a long trip, in which he saw a great abundance of game of all kinds except bears. He adds that he will be coming through Chicago before long, on his way East, with some more animals for the Zoo, among which will be some antelope. He states that the weather for three weeks preceding Oct. 15 had been extremely fine.

The Mazama Club, of Oregon.

Fifty members of the mountain climbing club, of Oregon, the Mazamas, made a trip out to the mountains the latter part of last summer. They climbed Mt. Pitt, near Ashland, some 350 miles south of Portland, from which city the party went by rail. Mt. Pitt is 9,760ft. in height, and little known by mountain goers. It has one glacier. The party, which included a number of ladies, had no especial difficulty in reaching the summit. Miss May Fuller, vice-president of the club and a resident of Tacoma, was the first woman to ascend Mt. Rainier. The Mazamas made many interesting studies around Crater Lake and other points of attraction, which are published this week in the Portland *Press*. Crater Lake was visited by the United States Forestry Commission, not long ago returned from their tour of inspection of the Western reserves, as mentioned in FOREST AND STREAM. Members of the Mazamas joined the Commission on this visit to the lake. In the party of the Commission at that time there were: Professor C. S. Sargent, of Harvard; Professor William H. Brewer, of Yale; General H. L. Abbott; Mr. Arnold Hague, of the United States Geological Survey; Mr. Gifford Pinchot, the forestry expert; and John Muir, of California. E. HOUGH.

1206 BOYCE BUILDING, Chicago.

DEFENDS DEER ROPING.

Editor Forest and Stream:

Now that the season is nearly over and our lawmakers will soon commence business again at Albany, there seems likely to be a strong effort to enact more laws to restrict the sport of deer shooting in the Adirondacks by prohibiting jacking and hounding, because it is claimed that the game is becoming scarce and needs protecting. Such things are always urged by a lot of fancy shooters with their high-toned ideas of still-hunting, wing shooting, long range rifle practice, etc., and not by real, old-fashioned hunters who go out for game and want a fair chance to get it.

Now, I don't care for bird hunting, but go in for big game. They say deer are becoming scarce; and yet over 5,000 were killed last season and probably as many more this year. This does not look as if they were scarce. I am interested in a fine bit of deer country in the Adirondacks and when we go to our lake in the season we are sure of good sport; and under the present laws I don't see why the game won't last for the rest of our lives. Of course, we go at it in a scientific way and with the best of appliances. Our boats are light and swift, our guides are men of experience and our dogs are trained to drive the game to the water. We start the dogs out in the morning and then sit around in comfort and wait until the "music" comes our way, then jump into a boat with a guide and watch for the deer to come into the lake. Soon he dashes in and starts to swim across, and away we go as fast as a pair of oars can drive the boat, and I have yet to see the deer that can swim as fast as one of those guides can row. The excitement of such a chase is intense and only big game hunters enjoy such sport. Overtaking the straining buck, the guide drops his oars and with a long, forked sapling and a bit of rope deftly slips a noose around the head, and then the good old 10-gauge gun with a charge of buckshot makes the supply of venison sure. It is great sport and no error; and the man who is cool-headed and a fair shot is sure to kill the game. Why, my boy, who is a chip of the old block, and only twelve years old, killed his deer the first time he went out. Quite a number of deer have been shot on our preserve by ladies of the party.

Now I venture to say that the majority of the big game hunters who go into the woods would have no pleasure or success without the jack light or the hounds; and why talk of making laws which will deprive them of the noble sport of deer hunting? We have plenty of game in sight and let us "let well enough alone." DEERSLAYER.

ROE DEER HUNTING IN GERMANY.

SCHÖNEBERG-BERLIN.—*Editor Forest and Stream:* And now comes Mr. Thomas Elmer to the rescue of his friend Joe and sees it proper to pronounce my remarks on Joe's description of a German "deer hunt" an "uncalled-for criticism." Reluctantly, but in duty bound, I shall now attempt to convince Mr. Elmer that he is guilty of what he pleases to charge me with.

Joe's letter was, in my opinion, intended to create various erroneous impressions among the readers of FOREST AND STREAM, at least among those, like Mr. Elmer, not versed in German sportsmen's practice and rules. From Joe's letter could be inferred that (1) roe deer are hunted in the Fatherland with 16-bore shotguns loaded with buckshot; (2) that roe deer are extremely scarce in this country; (3) that a 16-bore was not a fit weapon for field shooting anyway, and (4) that the German sportsmen are very poor shots, etc. In short, Joe's letter was misleading. He labored under an erroneous impression upon all the points here enumerated.

Joe was not invited to take in a "deer hunt," as Mr. Elmer puts it; he was asked to participate in a *Treibjagd, i. e.*, a "drive" for hares. There is a wide difference between the two. Hares are shot all the world over with shotguns, principally with 16-bore guns, which answer their purpose fully as well as those of a larger bore. Shotguns are never employed in a deer hunt. Roe deer are by no means scarce hereabouts; they can be found in large numbers in most parts of Germany. The does have ten months sparing season in the year, the bucks only two, but true sportsmen never shoot a doe. Joe killed what? A doe with her calf, a fawn. Joe not only innocently sinned against the sacred rules of sportsmanship; he also sinned against the written law. The shooting of a fawn is punishable with a heavy monetary fine and, as a rule, with the withdrawal of the individual hunting permit for a number of years. His German friends did not turn him over to the State prosecuting attorney, as they would have done with one of their own countrymen; they made allowance for his ignorance of the law, took all in good humor and, to quote Joe's own words, invited him to drink a barrel of beer.

Had Joe simply stated his experience in FOREST AND STREAM, without his general remarks before alluded to, I should not have felt the least call for any comments upon his letter. But he colored matters a little too strongly. Joe's shooting of a doe with her calf was a mistake, but one readily excusable under the circumstances. I should not have censured him for that, for we all have sinned similarly when we were beginners and younger. But Joe should not have felt so proud on his "double on deer." The circumstances did not warrant it.

I agree with Mr. Elmer that "When in Rome you should do as the Romans do," but Joe did nothing of the kind. Unintentionally he has done quite the contrary, and this notorious fact I wanted to go on record among American sportsmen through their recognized medium, the FOREST AND STREAM. ARMIN TENNER.

NEW YORK FORESTRY AMENDMENT.

ALBANY, Oct. 24.—The Fisheries, Game and Forest Commission deem it proper to furnish some information regarding the forestry amendment to the Constitution, which will be submitted to the voters at the coming election. The proposed amendment did not originate with this Commission, its preliminary passage through the Legislature having occurred in 1895, before the present Commission was appointed. Neither did it originate with our predecessors, the former Forest Commission, whose attention was not called to it until after the first passage of the act. Still, the members of this board, with their abundant opportunities for informing themselves in the matter, believe that the forestry interests of the State require the adoption of this amendment to the State Constitution, and respectfully ask that all our citizens vote affirmatively for the same.

If adopted, the leases thus authorized will conform to the provisions of Chapter 332, Laws of 1893, under which several leases were granted, all of which are still in force, and a source of revenue to the State. This provision is:

SEC. 120. To lease from time to time, for a term not longer than five years, land within the forest preserve, not more than five acres in one parcel to any person, for the erection of camps or cottages for the use and accommodation of campers. Such leases shall contain strict conditions as to the cutting and protection of timber and the prevention of fires, a reservation for travelers of the right of passage over the land leased at all proper and reasonable times, and a covenant on the part of the lessee to observe all ordinances or regulations of the Forest Commission theretofore or thereafter to be prescribed; and no exclusive privilege of fishing or hunting shall be granted to any person. All revenues received from such leases shall be paid into the State Treasury, and shall be placed to the credit of the special fund established for the purchase of lands within the Adirondack Park.

Owing to the immense territory owned by the State in the Adirondack region, now unoccupied by campers, the comparatively few leases that may be granted will in no way restrict or interfere with the wants or privileges of the public. There is plenty of room for all. But invalids desirous of a more permanent location and who are liable to be dispossessed by squatters can secure the accommodation necessary to life and health.

There are also a large number of cottagers on the preserve who were there before the Forest Commission came into existence in 1885. It does not seem right to issue writs of ejectment against these people and seize their buildings, especially as they are willing and desirous of paying rent. We prefer that these tenants-at-will should be made subject to some definite, business-like tenure, and that the State be permitted to accept the revenues thereby obtainable, as such funds are available for the further purchase of forest lands.

By the terms of our printed leases only five acres can be leased to any person. Such lease is available only as a cottage or camp site, and forbids the use of the premises for a hotel or any business, or for the sale of liquor. It prohibits, under a severe penalty, the cutting of any trees, and makes the lessee responsible for any forest fire on his premises. It gives the public right of way over the land so leased, and denies any exclusive right for fishing and hunting.

We believe the amendment a desirable one, and officially recommend its adoption. We ask every citizen to vote on the question and vote for it.

BARNET H. DAVIS,
President Fisheries, Game and Forest Commision.

ROCHESTER, Oct. 25.—*Editor Forest and Stream:* The proposed amendment to the forestry provision of the State Constitution, to be voted upon at the coming election, is opposed by the New York State Association for the Protection of Fish and Game, and the following open letter, signed by the president, Frank J. Amsden, of this city, and approved by the eleven members of the Association's executive committee, has been given out:

"The New York Association for the Protection of Fish and Game urges all people who have ever visited or may hereafter wish to visit the Adirondacks or Forest Preserve to vote against the proposed amendment to the Constitution permitting the selling or leasing of forest lands belonging to the State.

"The Forest Preserve, or State Park, was created for the benefit of the public at large, and not for the individual benefit of a few lessors. If permitted, the best localities for fishing and hunting would be speedily leased for an indefinite term of years, the public excluded, and the purpose for which the preserve was created would be destroyed forever.

"Several persons could combine under separate leases and control large tracts for their exclusive use and benefit, or could erect 'summer hotels' without number upon every available spot, stream or pond, and the beauty of the woods and the entire face of nature would be changed forever.

"Some people urge that this would protect the woods. Every one of these lessors must have fuel. Wood only is available, and the axes and saws would speedily cut firewood year after year until the woods would become only a timber slashing.

"What would the residents of New York or Brooklyn say if it was proposed to lease Central or Prospect parks in parcels? The people should vote against any leasing of parcels of forest preserve. It is not a question of a small income to the State from its rentals, but it is a matter of public rights. The rights of the public should be protected as well as those of State lessors."

The Sportsmen's Exposition.

THE Sportsmen's Association announce that the third annual exposition will be held in the Madison Square Garden, March 13 to 20, 1897. Spaces may now be reserved.

The Association also announces the preparation of a sportsmen's hotel directory, indicating all hotels located in game and fish regions. Particulars respecting such hotels will be given to members of the Association, and there will be also a bureau of complaint, to which may be referred all cases of ill treatment at such hotels.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

BOSTON AND MAINE.

BOSTON, Oct. 16.—Edwin D. Bell, Wilfred Bolster, James A. Bailey, Jr., and Ralph E. Sawyer, are absent in the Aroostook region hunting big game. Judge Bolster has just returned with a party from the same region. They obtained a couple of caribou and one or two deer. N. G. Manson, of Camp Leatherstocking, was due in Boston Tuesday evening with his brother.

A gentleman, uninitiated, who went down to the Union Station Monday evening to meet a friend expected from a gunning trip in Maine, was astounded by the number of guns he saw come off the trian. There were also a number of deer in the car of the American Express Co., but probably twenty guns for every deer.

Mr. Frazier, of Sudbury street, with a friend, was out Saturday in the woods near Reading after partridges, getting four birds. This is better than they could have done in the woods of Maine, almost anywhere, for partridges are very scarce there. Mr. Alonzo S. Harriman, Chief of Police of Arlington, has been on a shooting expedition for partridges not far from Bangor, Me. He returns with a good showing of birds, but does not give away his hunting location.

A very happy hunting expedition has recently returned from a camp ten miles from Schoodic Lake, on Endless Lake, that is managed by Mr. Richards. In the company were also Messrs. E. D. Van Tassel, A. R. Van Tassel, John E. Toumlin, president of the Shoe and Leather National Bank; Mr. Wood, and last, but not least by any means, Mr. Richards's son, Edwin L., thirteen years of age. He was the boy of the party, but all are proud of him, for the reason that he brought down with his own rifle a very fine buck, and the finest deer of the whole five brought out by the company. Mr. J. L. Richards has shot two moose in the region of the camp that bears his name, though none of the party obtained a moose this year. Two were seen, a bull and a cow, both of which kept well out of the way, the cow behind in such a way that the bull could not be shot without endangering his mate, which the law of Maine says must not be shot. Mr. Richards thinks that moose are falling behind in that part of Maine at least, and believes that a close time of five or more years should be put upon all moose in the State.

George H. Lanphier, who handles the FOREST AND STREAM for a number of subscribers in Boston, with R. D. Jones, of the Boston & Maine ticket office on Washington street, are out of the woods at Norcross with a deer apiece. Mr. Lanphier's deer is mentioned as one of the smallest he ever caught. Mr. Eugene Gibbs and Mr. A. A. Howard have returned from a hunting expedition in the neigborhood of Mount Katahdin. Their headquarters were at Tean Moore's, in Brownville. They shot four deer, one of which was white.

A movement is on foot to improve the fishing in Taylor Pond, in Auburn, Me. A petition has been signed and forwarded to the Commissioners by all the citizens around the pond, and each pledges himself to help protect the fish. Special contributions of fry are asked for, with such restrictions for a term of years as are needed.

Mr. Wm. H. Haley, of Wilmington, but who comes to Boston daily, in the iron business, is a pickerel fisherman. He enjoys the sport as only a true angler can enjoy it. He owns a number of acres on the shore of Martins Pond in his town. He does his fishing there. Last year he built a fishing lodge of logs, sided out at the mill, with a brick fireplace in the sitting room. But alas, for the best part of what he has hoped for! Fire got into the woods and completely destroyed his beautiful oak grove, though the camp was saved. The carelessness of some campers destroyed what it will take half a generation to restore. Mr. Haley greatly regrets his loss, but says that second growth has already started and he hopes that his grandchildren may enjoy what he is to be deprived of. Still his pickerel record for the season, beginning May 1, this year, and ending Oct. 1, is a source of pleasure. He has taken fairly, with baited hook, line, rod and reel, 1,100 pickerel. Some were of excellent size, and all were fairly good. All were saved and used except one, a small one, thrown over the bushes by the spring of the rod and lost. Note the satisfaction that even a pickerel pond affords a true lover of the angle. Tired business men are beginning to appreciate what they have left untried for years and years, and the FOREST AND STREAM is aiding in the good work by calling attention to what can be done and is being done.

SPECIAL.

A Moosehead Lake correspondent, writing from the Mount Kineo House, at Kineo, Me., reports: "The hunting in this section of the country is excellent this fall, and although it has been only two weeks since the season for killing large game opened, there has been an unusual number of deer, caribou and moose horns brought into Kineo. A partial list of some of the game that the guests of the Mount Kineo House have killed includes eleven moose, five caribou and numerous deer; but deer are so plenty about here that no one considers they have had a successful hunt unless they bring out a nice set of caribou or moose horns. J.

MASSACHUSETTS ROD AND GUN CLUB.

BOSTON, Mass., Oct. 20.—The last bulletin was mailed on Aug. 25. The club warden began work on Aug. 24, and has plenty to do. Places visited have been Topsfield, Boxfield, Middleton, North Andover, Andover, Wilmington, Tewksbury, Needham, Norwood, Walpole, Canton, Sharon, Foxboro, Easton, Milford, Norfolk, Uxbridge, Franklin, Bellingham, and parts of Dover and Billerica. A condensed report of his work is given below:

The Commissioners of Inland Fisheries and Game promptly responded to the club's request for a commission as deputy, and your warden duly qualified Aug. 28. The club is indebted to Commissioner Brackett, Chief Wade and several members of the club. A warden has much to learn.

In the North Easton snaring case (believed to be the first successful prosecution in the State for that offense) your warden deserves much credit for hard and successful work. The effect has been very apparent in all the adjoining towns, and his work in the case was helped much by a certain member of the club.

Several expeditions, it will be noted, are apparently without result. In some of them the complaints were not founded on fact, and in others it is hoped that the time will not prove wasted.

A short bulletin regarding Massachusetts game is also inclosed; and, if acceptable to the members, will be enlarged upon. Members desiring special information regarding good shooting localities might get good advice by inquiring of the warden and he will give what information he can to members.

The secretary thanks those who have sent in new proposals for membership, and it is hoped that more will soon be added. With membership raised one-half it would be almost safe to engage another warden, and with a membership of 200 we could enforce the laws in eastern Massachusetts.

The policy of the club is to work on practical lines, rather than theory of what might be done if conditions were different, and to use the funds in practical work. Ten dollars will do much work, but there can be much done. Please hand in at least one name to help.

In response to many inquiries, 600 copies of the fish and game laws were printed; there are about fifty left for distribution. HENRY J. THAYER, Sec'y.

Report of Warden.

Aug. 20 to 26.—In Boston learning duties and gathering information. Also each day took a short trip in the country, and sent home six persons who were out with guns. Could not arrest, not having qualified.

27.—Wilmington and Tewksbury. Sent home one gunner seen shooting, not being qualified to arrest.

28.—Qualified as deputy. Went from Canton Junction to Dedham. No gunning heard or seen. 29.—Rain.

30.—Dedham, Needham, West Dedham to Dedham Road. Stopped party fishing with set lines, and sent home four men with guns.

31.—Winchester, to see Commissioner Brackett.

Sept. 1.—Boston, getting information.

2.—Sharon to Canton Junction, Dedham Road and Dedham.

3.—Sharon and Readville.

4.—Dedham. Sent home one man with gun, but no evidence of shooting, so could not arrest.

5.—Canton and Dedham. (The past four days being used to put a stop to a party of three men who make a practice of shooting before the law goes off. Found them in the woods, but no evidence to convict or arrest.) 6.—Rain.

7.—Sharon. Complaint of quail shooting unfounded. 8.—Boston. 9 and 10.—Rain.

11 and 12.—Middleton, Topsfield and Boxford after snarers; found old snares, but not set this season.

13.—Canton. Heard one party shooting, but could not find him.

14 to 18.—Easton, on snaring complaint; about 200 snares in the town. Saw one person set snare, but did not arrest, preferring to wait till arrest could be had for the bird.

19.—Back to Boston for a few days, as it had become known that enforcement of the snaring law was to be made. 20, 21.—Rain.

22 to 25.—Easton; and took help to act as witness. Went over all the country, locating snares, and found two birds in a hedge of seven snares. Lay all day, from daybreak to dark, with witness also.

26.—Lay from daybreak till about 1:50 P. M., when a person (Clarence Hattenburg) came, took both birds out and reset the snares, when he was arrested. Took him to North Easton, swore out warrant, and he was put under bail to appear at Taunton on 28th.

28.—Took witness and appeared at court in Taunton, where Hattenburg pleaded guilty, and was fined $20.

29.—Walpole and East Walpole. Complaint of quail shooting unfounded.

Oct. 2 to 12.—Walpole, part of Foxboro, Milford, Norfolk, Bellingham and Uxbridge. At last place some snaring is done.

Texas Game Notes.

PETTY, Tex., Oct. 19.—The weather of the past week has been comparatively uniform in temperature for this season of the year. A light rain caused the mercury to drop to 43° on the 10th, and in consequence of this cool wave we had a considerable flight of ducks, geese and brant, but owing to some unexplainable cause fewer fowl than usual stopped on the pools. One party killed a half dozen teal and two mallards, and besides this I have not heard of any other bags. The condition of the atmosphere to-night indicates another cold spell, and I also heard a considerable flight of brant. This is almost an infallible indication of an approaching cold wave.

The season for quail shooting has not yet opened in this part of the State, and in fact there is very little interest shown in out-of-doors sport in this country. Occasionally one can hear of a party of hunters having been out for a day shooting quail, but as a rule there is very little quail shooting done in this immediate locality, and it seems that the supply of this wary and toothsome bird ought to be more abundant than it actually is; but any one who understands the habits of Bob White (and he is a very simple bird) can get a good day's sport any time during the fall and winter if he has a good dog and will go out into the country a couple of miles from the village.

The grain fields are a great attraction for the wild geese as they pass on their annual trip to their feeding grounds on the Gulf coast, and it is a very common sight to see immense flocks of this shy and watchful bird settle down in the cornfields in plain view of the town. But it is not an easy task to stalk them. About the only way a shot can be secured is to go to the cornfields before daylight and secrete yourself in a patch of weeds, and wait for them to come in for their morning meal (which they do just as it is sufficiently light to enable them to see well), and as they circle around over the field, getting a little lower each time the circuit is made, take your chances for a shot as they are a little past you. (They are very difficult to kill as they are coming toward you.) I have known of a great many having been killed in this way. PROVO.

Rhode Island Notes.

PROVIDENCE, R. I., Oct. 24.—That stray deer continues to be reported in different parts of the State, but no one seems able to obtain a shot at it, although it is strongly recommended that the animal be allowed its liberty.

William P. Morton, of Wickford Junction, has received 3,000 small trout from the American Trout Co., of Shannock, to be used in stocking the streams of Exeter and North Kingstown.

Frank A. Richmond, of Washington Village, seems to be among the most expert raccoon hunters of his section this season up to date. He lately secured one weighing 14lbs. and one weighing 20¼lbs.

Barber Brothers' fishing gang, of Westerly, caught a bass weighing 56lbs. in a net off Noyes Beach on Saturday, the 3d inst.; 5 to 8lbs. weight is considered good size for a bass. This was as large as a ten-year-old boy, and when found in the net just as lively.

Edward Balmer, of Whitinsville, Mass., while gunning a few days ago shot an albino red squirrel that was as white as snow.

Frank B. Reynolds and Charles H. Fuller have been enjoying a hunting trip for three weeks in northern Maine. They returned home last Monday night, highly pleased with their vacation. Game being plentiful, both gentlemen were successful and brought back trophies of their trip. Mr. Reynolds has a very handsome pair of stag horns. They each secured two deer, one of them the largest buck (as the old guides say) that has been shot in the Maine woods for many years. It weighed over 400lbs.

FUN IN THE ADIRONDACKS.

Editor Forest and Stream:

Some of the fun recently narrated in your colums has been so enjoyable that I am moved to send you an account of other some. For obvious reasons names and localities are withheld, but the incidents are true happenings in the Adirondacks.

NO. I.

LOCI.—A backwoods hotel, a beautiful lake, the surrounding forests.

DRAMATIS PERSONÆ.—*Ductor*—A fun-loving fellow, who will make you laugh at the pain of an operation in his office by the twinkle in his eye as he protests the innocence of his intentions, or divert you from the pain by some story of sporting adventure; a lover of fair play, a true-hearted, whole-souled gentleman, "a true sportsman."

Caupo—Keeper of the aforesaid hotel.

Nobiles—A party of young fellows from town, aristocratic in feeling, but not above rudeness in conduct.

Plebes—A party of honest, manly young fellows from the country.

Spectators—Ladies and gentlemen, guests at the hotel.

ACT I.

The Plebes "get up a hunt," and being good fellows gives the Nobiles an invitation to join them. The invitation is accepted, the hunt takes place and is successful.

ACT II.

The Nobiles "get up a hunt," and being selfish do not invite the Plebes in return, which slight is keenly felt by the Plebes.

ACT III.

Ductor takes a hand. Being a lover of fair play, he thinks the Nobiles should be taught a lesson; thereby the Plebes shall be comforted. He knows that Caupo has an old deer head, moth-eaten and worthless, in the barn, and his plan is quickly formed. Caupo is consulted, and readily gives consent to the proposed use of his deer head. Then Ductor proceeds. The head is mounted on a box, which is weighted with stone enough to sink it partially, thus giving the head the appearance of a buck swimming in the water. The box is taken out toward the middle of the lake, a string is attached and run several hundred feet to a pile of logs on the shore, a man to pull the string is placed behind the logs, and the entire apparatus is ready. Everybody is warned not to go out on the lake, as it may be dangerous; also to be around the piazzas about the time for the hunting party to return, as there may be some fun. The time arrives, and there comes the little fleet of Adirondack-guide boats, each with its aristocratic, selfish "sport," and guide to row him. Soon the foremost boat is seen to dart forward rapidly, then another, and another, and another, till they all seem madly contesting for first shot at the swimming deer. (The string is working well.) After a few minutes' hard rowing one of the rear boats opens fire at long range, then another; at once there is a regular fusillade, each hunter being determined to draw first blood. Presently the leading boat is near enough to detect the cheat, and drops to quiet rowing, others soon follow suit; then one after another they reach the dock, the mighty Nimrods stalk grimly and silently past the assembled spectators, and amid a shout of derisive laughter the curtain falls. The Plebes are avenged.

NO. II.

The joke was practical, but cannot rank as classical, for it lacked the element of retributive justice which appears in No. I.

A quartette of young bloods were in the woods for a good time. One had never killed a deer, but was exceedingly anxious to do so. The trip was nearly over when the joke was arranged. On a certain night none of the quartette nor other guests would hunt, but the anxious one was urged to do so, as the night was favorable and his time was short. He went, and everybody at the hotel remained up to see it through.

By and by the boom of his gun rang out on the night air, and the plotters knew their ruse was successful. They waited; he came, and without a word stood his gun in a corner and himself by the stove, for the night was cold and so was he. Then questions came.

"What did you shoot?"

"Nothing."

"Why, we heard you?"

"No, I haven't fired my gun to-night."

"Why, we heard a gun and thought surely you had something. Are you not fooling us?"

"No, if you heard a gun it must have been down river.'

"No, it wasn't; it was up river and must have been yours."

Then he walked over and began a conversation with the landlord.

"Have you any young stock on the place?"

"Nothing but a last fall's calf."

"What will you take for it?"

"Oh, it isn't for sale."

"Well, what'll you take for it?"

"Why, I can't sell it at any price; it belongs to my wife."

"Well, what's it worth, anyhow?"

"It's worth $25, but I tell you I can't sell it."

"Well, I've shot your —— calf! Here's your money."

The calf had been tied in good position on a point up river—the guide was of course in the secret—the plan worked; the joke was out, and the resultant treating was said to have cost the victim over $100 before he reached home.

JUVENAL.

A Philosophic Question.

I OBSERVE in Sunday's *Sun* a brief article on the growing practice of the exhibition of photographs of big kills of game and big catches of fish by huntsmen to convince persons of the truth of their statements, and *The Sun* seems to think this is convincing proof. In view of this I should like to ask *The Sun* if it has ever seen the artistic and appropriate collections of "scenery" possessed by photographers who have galleries in the small towns adjacent to hunting and fishing grounds?—*Maine Correspondence, New York Sun.*

The FOREST AND STREAM *is put to press each week on Tuesday Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.*

The Tennessee Quail Supply.

GRAND VIEW, Rhea County, Tenn., Oct. 19.—I desire to say a word of caution to the quail shooting members of the FOREST AND STREAM family. Do not allow anything you may read in the papers to persuade you that you can find quail anywhere in this State where you may choose to look. My personal experience this season is confined to the counties of Rhea and Cumberland, where the birds are scarce on both mountain and valley.

The people seem disposed to preserve the pitiful remnant which still exists from their former abundance.

I have heard of a very few flocks, but have seen none. An intelligent boy told me yesterday that he had heard them whistle, but had seen none for a year. Yet they were very numerous three or four years ago. The damnable practice of netting them for sale, the huge bags made by shooters from Kentucky and elsewhere, and lastly the freezing weather of two winters ago have almost exterminated them.' I am credibly informed that Meigs and McMinn counties are in the same fix.

Will write you more at length later. KELPIE.

National Park Extension.

CHILLICOTHE, O., Oct. 23 —*Editor Forest and Stream:* I note in FOREST AND STREAM of 24th inst. letter of Mr. John F. Cowan, of Butte, Mont., relative to and advocating territorial extension southerly of Yellowstone National Park, and your editorial concerning Mr. Cowan's letter and its subject.

I am most heartily in favor of the proposed enlargement. It should be done by all means, and I believe we can do it. Kindly urge the matter in the columns of your powerful journal and call on the boys for help. I am sure you will get a hearty response. I will gladly do any and everthing I can, and will cheerfully place myself under the commands of any one who will take the matter up. I am anxious to see the Three Tetons, the most majestic mountains in this country, added to the National Park. If FOREST AND STREAM will take the matter up I believe the thing can be accomplished. I believe the time is ripe for the movement, and it is now or never, so far as the game is concerned. I trust that you will father this matter, and pledge my feeble support.

L. B. YAPLE.

Sea and River Fishing.

THE RESTIGOUCHE AS IT WAS AND IS NOW.

Editor Forest and Stream:

Dr. R. T. Morris, in your issue of the 10th inst., says it is of little use to restock the Delaware with salmon, as the white man, the Indian and shad net forbid it. We all know that the poached salmon, moose or caribou is sweet simply because they may be forbidden at certain seasons and under certain restrictions, and any salmon river settled along its banks will be sure to have a good quota of poachers. Most of our best Canadian rivers are only settled for a few miles above their mouths. The mountainous nature of the country and soil prevents agriculture, and the poacher has difficulty in bringing his catch down should he make it and in getting a market.

Dr. Morris says that the rivers in Newfoundland, Nova Scotia, Quebec and New Brunswick are badly poached and netted, nets barring the streams and set in the resting pools in defiance of authority. So far as Nova Scotia rivers are concerned for angling purposes, the game is not worth the candle. True, a few salmon frequent them, but the water and bottoms are not suitable, any spawning grounds there are are covered with saw dust and mill rubbish. I believe they are free to all or nearly so, although the riparian ownership exists in Nova Scotia as well as in the other provinces. The trouble is that they are of no value. One pool on the Restigouche would sell for more money to-day for angling purposes than the whole Nova Scotia rivers put together. There are only two or three rivers in New Brunswick (barring the Restigouche) worthy of the name: the Tobique, Miramichi, Jacquet and Nepsiguit. The last named is the best; but the angling limits are very short, the falls are a stopper to the salmon.

Dr. Morris says he has been told and has heard the natives boast of spearing the salmon on well-protected streams on the Bay Chaleur waters. On this subject I am at home, having had charge of the Restigouche River as well as of the estuary netting from 1869 to 1882. Previous to 1869 the Indians (300 of whom lived on a reserve at tide head) speared salmon at their own will, having a right, as they said, from God, who made the fish for their use. They would follow up the first run for a couple of days, and having a canoe full would sell them for 3 cents per pound at Campbellton to traders for rum, biscuit and pork. As the fish got further up the rivers they followed, on their way down, five and six canoes abreast, so a fish could not escape them. The Fisheries Act forbade all spearing (in '69). H. Peter Mitchell, then Minister of Fisheries, told me I would have to stop this spearing. I said: "Sir, unless those Indians are granted some equivalent, to which, I think, they are entitled, I will not do so." A very large station of nets was procured and set out for them on their own grounds in lieu of the spear. This they refused; drove the men off; cut down pickets, destroying the nets; and the same night ten canoes started spearing. I took the whole, destroying some, taking out the fish, and the next morning had the whole band before Commander Larise; tried them under the drum head and sent six of them to goal. This ended the Indian spearing on the Restigouche.

At this time every settler on the Bay Chaleur and estuary who owned 200 acres of land could, if so minded, set a salmon net in front of his property. At this time it was not a paying business. Salmon were scarce and low in price, and twine was dear. The Fisheries Act provided a remedy, viz.: No man could set a net without obtaining a license, which the department alone could grant.

At this time it was proposed to establish a hatchery to restock the river. I pointed out to the minister the necessity of controlling the netters or we would be simply benefiting them, and the nets would increase tenfold. The trouble was it had to be made universal. The minister knew well that his own constituents would kick dead against it, but he ordered me to try it on the Restigouche, giving me arguments to use in its favor; and it was enforced in 1872 successfully. At the same time, as the Federal Government had not recognized riparian rights, and had leased for nine years the river and its tributaries, and all settlers who claimed a right to set a salmon net in fresh waters were prohibited from doing so—any one who considers what those changes meant to a fishery officer to carry them out against the long usage of netters and spearers must think it was no sinecure. Often my life was threatened, but I am still to the fore.

Let me give you a view of what the Restigouche's capabilities really are as a salmon river. A bark canoe can ascend it with a fair load two and one-half miles per hour. Horses can tow barges from one end to the other. There are no roads after the first ten or twelve miles, no settlers. It is a pristine wilderness. There are 148 miles of open angling water, nearly all under lease or purchased from riparian owners. There are 125 miles of branches set apart for the natural propagation of salmon, on which the finest spawning grounds in the world exist; lastly a hatchery that turns out a couple of millions of fry yearly. No doubt 100 rods are on it yearly. The fad now is to buy a pool worth $30,000 or so; but there are none of those for sale now; such have been sold, I may say they were the choicest on the river. JNO. MOWAT.

THE McCLOUD RIVER.

Editor Forest and Stream:

In reading the recent numbers of your journal, which lay over uncut during summer vacation, my attention is attracted by the pleasant article of your correspondent Ransacker in the number of Aug. 22, in which he sings praises due this most beautiful of the tributaries of the Sacramento. Strictly speaking, it is a tributary of the Pit, into which it pours its volume, and the Pit then empties into the Sacramento about five miles further down.

Thinking possibly something might be added to the history of this section of interest to some of your coast readers, the writer has refreshed his memory from the leaves of an old note book. In earlier years, before the railway was laid through the cañon of the Sacramento, stage lines transferred the travelers from Redding, in California, to Roseburg, in Oregon; these towns being at that time terminal points of the railways then constructed. The upper Sacramento was a paradise for sportsmen, and the fountain of youth for healthy invalids. Allen's, on the McCloud, the first stop after crossing the Pit River ferry, not a great way from the U. S. Fishery; Southern's, now Sims Station on the railway; Bailey's or Lower Soda Springs, now Castle Crag Tavern; Fry's or Upper Soda Springs; and Sisson's, the shrine to which pilgrims flocked who worshiped the hoary old mountain: these were the popular resorts for seekers of health and for lovers of rod and rifle. No outing was complete if the visitor failed to rest under the shadow of Shasta, and lacking that experience he failed to take away true inspiration. Not to have camped, too, on the upper waters of the McCloud, at the Horseshoe Bend or other favorite resort, or to have felt the thrill and rapture of strife in the struggle to capture and safely land *irideus*, or to have won the antlers as a trophy and tribute to skill with his Ballard, was for the faithful to have visited Mecca without kissing the Kaaba Stone; health would not have dwelt in his bones.

The writer spent many happy, restful hours in visiting camps on the banks of these rivers, and not unfrequently interviewed the elder Indians of the tribe which once inhabited the section, now nearly passed away, with the hope of gaining some knowledge of a fading race that would be of interest. There was not much to learn from them. They were inferior mentally and physically, comparing unfavorably with the tribes once of the Atlantic coast. They developed little native art, only enough to meet the simple wants of savage life, such as hunting and trapping wild game and fish of forest and stream. Their lodges, which gave protection from extremes and rigors of the seasons, were of simple structure, models doubtless unchanged for countless generations passed. As to their dialect, a few words expressed their ideas or wants, which were limited. Impressions of them formed since having opportunity for comparison is that they were inferior to the tribes further north in Oregon, Washington and British Columbia.

They named the Sacramento River Wymim, the McCloud Winnimim, and the Pit Pooimim. Attracted by the analogy in the naming, which was suggestive, and questioning some of the more intelligent of the tribe, we soon found it plain that Wy meant North, Winni or Winne Middle, and Pooi East; and so we had Wymim, Winnimim and Pooimim—North River, Middle River and East River; Mim being in their dialect a generic word for river.

The writer has never seen any early map of California, referred to by your correspondent, on which the streams are laid down as West, Middle and East forks of the Sacramento; but has in his possession an early map on which the so-called or written McCloud River is laid down McLeod, and such is without question the correct way of spelling the true name of the river. So much for the aboriginal names of these upper waters of the Sacramento.

The name of the McLeod River as now spoken, but not as now written, originated out of the following circumstances: In 1828, nearly a score of years before the International Boundary was settled by treaty with the British Government, the Hudson's Bay Company had its headquarters for the Pacific coast at Fort Vancouver, on the right bank of the Columbia River, now Vancouver Barracks and headquarters of the Military Department of the Columbia. Dr. John McLaughlan was then resident agent. The Rogue River Indians at that time had given trouble massacring a party of trappers and robbing it of furs. The resident agent, finding it necessary to punish them, dispatched Alexander Roderick McLeod, a factor of the company, in the command of a party of men to the scene for that purpose. McLeod had just returned to headquarters, having executed a commission against the Clallam tribe at the north near Port Townsend, punishing them for depredations they had committed. After settling matters with the Rogue River tribe, he continued on further south according to his instructions, crossed the Siskiyou Mountains and explored the headwaters of the Sacramento in the interests of his company and in search of fur-bearing animals. After exploring the Pit River which he named, he made his way along the Middle or McLeod River, for so we will now write it, and was returning after a successful hunt with his furs; but not heeding the warning of some of his experienced associates remained too late in the season, was caught in a severe storm in the mountains, unfortunately camped on the summit and was snowed in. He lost all his horses, but cached his furs and with difficulty worked his way down to lower levels. The furs were recovered the next spring, much damaged through insecurity of the cache, and resulted in great loss. His men, some of whom were Canadian French trappers, named the river La Rivière de Monsieur McLeod, and McLeod's River it is; for it is certain that the old officer of the Hudson's Bay Company who in 1830 had charge of the California department, with headquarters at Yerba Buena (San Francisco), in a letter to the writer, dated May 3, 1879, speaks by the record of his company when he writes with interesting detail: "This is the origin of the name of the river, being frequently written McCloud's River, this being the pronunciation of McLeod." G. B. C.

MEN I HAVE FISHED WITH.

XVIII.—Antoine Gardapee.

(Continued.)

I WOULD ask all such "tenderfeet," in whose ranks I was then a recruit, although the term had not been invented, how they would feel to awake in a cabin in a forest where there was no white man within forty miles, except a partner who was off running a line of traps, and find an Indian standing silently by the bed? Just put yourself in his place.

After the choking sensation which comes with such a scare, and a partly paralyzed heart had begun its regular work, the firelight, which, by the way, the intruder had replenished, showed the features of our friend Ah-se-bun, who gave a saluting grunt and turned toward the fire, where he sat until I arose, washed and dressed, and prepared to get breakfast. The door had been held shut against wind and snow by a prop, for there was no fear of animals where there was a man and a fire, and our guest had somehow removed that without disturbing my sleep, but how long he had been in the cabin was unknown. He held down a stool by the fire, while I cooked breakfast, and he sat there and ate enough for half a dozen laboring men, and drank coffee until there was none left. Antoine had taught me never to betray any curiosity, and so I handed over a pipeful of tobacco and waited. Old Raccoon looked at me inquiringly, and I at once filled my pipe, although I never could endure tobacco in the morning, and I took a few puffs and awaited his pleasure, curious to know why he had made such an unconventional call at so early an hour. He smoked his pipe out, emptied it, and sat for what seemed a long time before he spoke.

After some repetition and much gesticulation, it appeared that he had met Antoine, and that the latter had killed a bear, and I must go with him and help get it to camp, and after arranging things in the cabin I took down my rifle to start, when my guest shook his head and said, "Kowin," and I replaced it at the door. I understood then that there would be load enough without a 10lb. rifle, and we went off to bring in the bear.

Enough snow had fallen during the night to make hard traveling without snowshoes, so we tied them on and started—Ah-se-bun in the lead—up a stream on the west side where I had never been, but where my partner's line of traps began. A short tramp of some five miles brought us to the place where Antoine had killed the bear, about a mile off his line. He was there cooking his breakfast when we arrived, for he had been up and had the bear skinned and dressed before he started in to cook. It happened that he had run his first line of traps some fifteen miles and was crossing the divide to his homestretch when he found a fresh bear track in the snow, which had begun to fall late in the afternoon, and he turned and followed it. The track led him back toward camp and he came upon bruin about sunset and killed it where we found him.

When we came up to him he said: "I t'ink you better come up and take ole Afum to camp an' I'll go on an' run my trap, hey? What you want? Bre'kfuss? I t'ink yes."

I said to him: "I have been to breakfast, but can eat a little more after the long tramp on snowshoes, but if you'll only let our friend the Raccoon have a fair whack at that bear the load will be lighter to carry. He's had one big breakfast, about five times as much as I could eat, but just let him fill up on bear meat and our load home will be light."

Antoine thought a minute and replied: "I'll tole you. I'll doan lak bear leever, but a Injun he lak him bes' of all. I'll cook-a heem dat leever an' you'll heat my col' pa'tridge w'at I roas' las' night w'en da bear was warm. I'll tole you I'll have long chase for Afum, an' I t'ink I'll loss him in a dark, but he stop to look roun' an' I get him.* He good an' fat an' w'en he freeze I lak heem jess so good as de pork, an' he make some good fat for fry de feesh an' roas' de pa'tridge."

Antoine rigged a couple of light, flexible poles to a piece of bark, on which we placed the hindquarters of the animal wrapped in its skin. A short, light rope was attached to the poles, and with the rope as a breast collar and a pole under each arm a man could haul quite a load over the snow where a sled would have cut in. The front edge of the bark was rolled up sled fashion, and by following the stream and trail it was mainly a down-hill haul, with the exception of a few knolls. When all was loaded Antoine went his way over his line, and I pointed to each load and then to Ah-se-bun to take his choice, the hindquarters and skin being the heaviest. Which do you think he took?

It has been said of a man who is so unfortunate as to have to carve at his own table: "If he takes the best cut for himself he's a durned hog, and if he doesn't he's a durned fool." Now, in making choice of loads—as well as in some other things—I will bear witness that my red friend was not a "durned fool." There was a sort of straightforwardness among the Indians whom I met that I've never been able to acquire. They knew what they wanted, and they went for it without being hampered by etiquette. If there was carving to be done they could never be ranked with the d. f.'s, and when the choice of

* That word "Afum" bothered me for years. At first I naturally supposed it to be Ojibwa or French for bear. The former is "muckwo" and in later years I have learned that Western men call the grizzly bear "Ephraim," and now believe that this was the name that Antoine tried to use.

loads was offered I got "the lion's share." With more experience in the ways of "Mr. Lo," he would not have been offered the choice of loads; at the risk of being thought a d. h. I would simply pick up the poles of the lighter load and leave him to choose the other.

It was quite a pull, and our freight had to be unloaded several times to get it around the bad places on an Indian trail, for an old path ran along this stream which somehow was indistinctly visible even in winter by marks, such as fallen trees which showed where they had been worn by being stepped upon or by having lodge poles dragged over them, clumps of bushes which had been avoided, and the many things which an observing eye notes. At times it required both of us to take hold of one load and lift or drag it over or around an obstruction and then do the same with the other. I gave my companion frequent opportunities to exchange, but he didn't take them. I was too polite to pick up his poles, but Antoine said afterward: "By gar! W'en you want for change load, you mus' change. He t'ink you big fool w'en he gotta da light one all a tam. Nax tam you tak-a de small load. He lak-a de big one w'en dat's w'at he got. He gotta lak heem."

When we came to the cabin the sun was well past meridian. Clocks and watches had been left far behind us. "We took no note of time but by its loss." Ah-se-bun, the Raccoon, was hungry. What does half a dozen pounds of bear's liver eaten in the morning amount to half a day later after hauling part of a bear five miles over crusted snow that often had a sidelong slope toward the stream, and over a crooked and log-barred path? I was hungry also, but had never got into the Indian habit of eating enough in one day to last for three, and so I started in to get dinner. I plucked up courage and told Lo to go and get some dry wood. He pointed to a pile in the corner that was kept for such an emergency as severe weather and intimated that there was plenty. I was tired, hungry and cross, and just in the humor to lay aside all notions that I must treat an Indian as a gentleman, and I then put away the bear steak, hung up the frying-pan and merely said "Nish-ish-shin" [good] and lighted my pipe and sat down; in other words, I "struck." I thought it out something like this: Here was a lazy, gormandizing Indian who came and went at pleasure, and could eat as much as four hard-working white men and then sleep for a week after it; who would probably stay by me as long as the bear lasted and eat the greater part of it, after shirking the heaviest load on me, and now he was too lazy to get wood to cook his dinner because there were a few sticks in the cabin which were kept for bad weather. After smoking a few minutes and feeling no less angry I lay down and slept as only a tired man can sleep. A noise awoke me, it was my red friend bringing in wood. It was dark outside, he had thought the matter over and had concluded that he wanted to get some wood and had got it. This was comfortable to me, and I cooked a great lot of bear steaks, baked some bread and we had dinner. He cared nothing for bread unless soaked with fat, but the amount of meat he could secrete was enormous. It is surprising what an amount of animal food a white man can consume in the clear, cold winter air of the woods, whether in Wisconsin, Maine or the Adirondacks, especially if he is running a line of traps or hauling half a big bear over a trail that is covered with crusted snow, but an Indian can discount him. From that time forward I had no fear of asserting myself and of bossing the ranch when our guest and I were left alone. I dropped all my civilized notions of etiquette and got along nicely. This, of course, does not apply to Antoine, for he and I vied with each other in doing camp work, and he had all the consideration for a companion that could be expected of a man who had been reared among different surroundings; but for an Indian I began to entertain different feelings. I understood and appreciated them better afterward, but just then I was in the transition state of being disillusioned.

When Antoine came, two days later, he had some skins and a woeful tale of broken dead-falls and of traps carried off. Ah-se-bun had gone. A wolverine had struck Antoine's line and the old man was tired and cross. He sat with his head in his hands before the fire, while I made him some coffee and broiled him some venison chops on a grill made from some wire we had brought for tying traps or other purposes, and then I fried some fish in bear fat, and set out the tin cups and plates and we ate in silence. It was a good dinner, fit for a hard-working trapper who had come in tired and angry at having lost the fruits of his labor. I would not use the hackneyed phrase, "Fit for a king," because it was too good for most of the kings who have come to my notice—the dinner was good for Antoine and for me, two American kings of the forest, who held dominion over all the beasts and exacted tributes of fish, flesh and fur from them. And another marauding wolverine was invading our realm!

By some unwritten law my stool was always at the left of the fireplace and Antoine's on the right. The tobacco bag hung on my side, and when we were in executive session it was my duty to hand out "the weed of Ole Virginny." So after we had removed our stools from the table, which was half an oak log with legs set in holes made by an inch auger, we sat down in our places and I handed the old man the plug. After his pipe was filled and emptied he said: "You stop here till I keel de dev'. I go watch for heem. My trap all fix, all right—he come to-night an' I keel a-heem, he keel a-me, it make no dif'. He run my line all a-tam an' I no git heem; he break all our trap like hell a'most. Gimme some tobac."

Tobacco had a soothing effect on Antoine, as it has on many men, and a second pipe quieted his anger, but did not interfere with his determination. I filled his haversack with provisions, and with blankets and snowshoes on back and rifle on shoulder he started on his mission of revenge. He did not say with Shylock:

> "If I can catch him once upon the hip,
> I will feed fat the ancient grudge I bear him."

He had never heard of Shylock, but he had in his heart all the revengeful feeling that the poor persecuted Jew felt for his enemies.

It was well along toward sundown when he left, and I cleaned up our table and got in the night wood, and spent the evening in the unpoetic work of darning my woollen socks, filling the box in the stock of my rifle with greased patches of proper size, putting new strings on the ear-laps of my cap, overhauling my mittens, examining suspenders and buttons, and doing all those little things which men wholly cut off from the deft hand of woman must do for themselves in their own bungling way—or have a breakdown when there is neither time nor opportunity for repairs. It is wonderful what a man can do when thrown on his own resources, when there is the same imperative word "must" which always confronts the soldier. He must, or—

Rolling up in my blankets, I fully expected some adventure or visitation before morning, but nothing happened. Three nights passed in this way. I fished, cut fire wood and busied myself with other things, but always with a thought of Antoine. He was a long time coming, perhaps he might be caught in a bear trap—there was a big one on his line—or perhaps he might be crippled by some accident and be starving! He did not come, and these thoughts by repetition became probabilities. I filled my sack with provisions and shouldered my rifle. I would meet him on the back track, and I followed his returning trail all day and crossed the divide between his two streams and crawled into his camp at night. His trail was plain, although I had never been over it before. He had rigged a sleeping place beside a huge log and had made a shelter with poles and brush. A bed of leaves was inviting and I rolled into my blankets and slept until morning.

He had not left the trail so far, that was plain. After breakfast I started down his line on the other stream and after a few miles found one of his dead-falls broken. Here was the first evidence of the robber. Further on I found where Antoine had left the trail and gone off to leeward, and had made himself a sort of breastwork camp in good range of the rear of a trap, and on examining the latter there was evidence of a tussle and some blood, but about an inch of snow had fallen in the night and the affair had occurred at least twenty-four hours before, but Antoine was still missing. I saw where he had left the trail and where he had returned to it 100yds. below, and again where he had stepped on the stones in the creek which led a long way down as well as across and I took the trail down the valley home. He was not there and it was nearly night of the fourth day. He had been out four nights and I was alarmed—perhaps "scared" would express it better. Here I was hundreds of miles in the wilderness alone. The feeling was not entirely one of selfish helplessness now. I could care for myself fairly well in the woods and did not mind its solitude, but I found that I had a feeling of love for my companion which had been latent and only brought out by his long absence, which it seemed must be caused by some accident. I ate supper and tried to sleep, but for the second time in the woods I was tired, but not sleepy.

Morning came. I cooked enough to last me several days on a trip after my companion. I would go back to the stepping stones where I had lost the trail, and find it. Dead or alive, I must know where Antoine was. He had not been hurt in a dead-fall, that was sure, for I had seen them all, but, if living, he would surely have been back before this. I slung my haversack and blankets, and started back on his outgoing trail, determined to find him if possible, and to look closer along the banks of the stream, where the new snow might have covered his track for a short distance. I had hardly got 100yds. from the cabin when I heard Antoine call: "Hello! where you go now? Come back here, I want some grub for to heat. You run 'way w'en I come lak you doan want a see me. W'at for you go off dat-a way?"

He had come in on my branch of the stream, and if I had got out of sight or hearing before he arrived there would have been a long and useless tramp for me—and perhaps one for him to find me. Who knows but we both might still be going the rounds in the wilds of Wisconsin on each other's trails. I made him hot coffee, while he unslung his pack and washed, and then it was good to see the old man "heat." Slices of cold boiled bear ham, hot broiled venison steak, tin cups of coffee, and more bread than I dare tell, went in quantities, and it seemed a long time before he pulled his stool to the fire and said: "Gimme dat tobac'."

It took three pipefuls before he felt like talking, and then seeing that I betrayed no curiosity he said: "I got dat ole dev'," and then paused. I knew him too well to make any reply or ask a question. He had taken his first liking to me because I had happened to betray no curiosity, and I knew that if he was questioned he would give short answers, but if let alone he would tell it all in his own way and be anxious to do it. His pack of skins lay on the floor unopened. I sat and looked at the fire, for I could not smoke as much as he, and when the spirit again moved him he said: "I got hees skin dere in de pack, w'en I hopen it you see heem. He make me hard run all-a night after I break his laig f'um where I hide by my trap, an' it was his front laig, so he go 'long good, an' I'll run all de night w'en I can see heem or hees track, an' I shoot-a heem t'ree time on a run an' I no hit heem. W'en day come I see da track plain, an' I stop for res' an' heat my grub. Ole Carcajou he no lak-a daytam for be hout, an' I t'ink me he fin' some hole for lay hup in. So I go 'long slow for give heem tam to fin' hole, an' he go all-a day 'way off to nor'eas' lak he go to-a Wiscons' Riv'. Nex' night I fin' hees hole an' I make fire an' sleep by heem. Mornin' I see it was all a rock an' not hees deep hole in a groun' for to have to smoke heem hout, so I pull some rock down and see heem, an' he growl, an' I shoot. He was too much tire to go on to fin' deepes' hole. I'll tole you, hees skeen a'n't wort' much, but w'en I no getta heem we no do more trap in dis part. Dat was good hunt. W'at you say, hey?"

That was a long story for Antoine, but he felt proud that his enemy's hide was in his pack; for this wolverine, sometimes called "glutton," seems to take delight in destroying traps or in befouling the bait if he does not care to eat it, and the trapper who finds one on his range must kill it or go elsewhere. It is very cunning and has great strength, a combination of bear and fox, and is well characterized by Antoine as "de ol' dev'." The skin has some value for robes and rugs, but to the trapper whose line it has discovered its hide has a greater value than any fur dealer would give for it—a hundred times more.

When Antoine unrolled his pack he had a lot of skins, mainly from one of my lines which he had come down. In the lot was a silver fox, the first I had ever seen, and several pelts of the white weasel which we call "ermine." It was my turn next day, but as one of my lines had been recently run by my partner the work was light because there were few traps to reset.

In the morning I thought to make a quick run, and as there was only a couple of inches of snow on top of the hard crust I left my snowshoes in the cabin, but Antoine called me back, saying: "I'll tole you, w'en I'll see da ring on da moon las' night we go gat some snow bambye, and you'll want some ah-gim for walk home. I'll tole you." So I went back and slung my snowshoes and started again.

About a mile from camp a fox had killed a rabbit, and left the story of the tragedy recorded in the snow. There was the track of the rabbit, with its three holes in the snow made at each jump, but as the leaps were only 1½ft. apart it was evident that it was not frightened. The ambush of the fox was plain where it had crouched in the snow, and the hole scooped out where it had struck its prey; and then the single line of footprints where it had trotted off with the rabbit, all the feet set in one straight line, fox fashion.

I amused myself in picturing the midnight scene by the evidence of the snow and went on to the first trap. It was a strong double-spring steel trap set under a log in a place which a mink or fisher would be likely to take on its way to or from the creek. The snow had drifted lightly over the pan, concealing it, and in the trap was the foreleg of a fox and a rabbit lay near it. Here was another story of the woods, briefly told. I reset the trap, smeared rabbit blood about it, took the rabbit for bait for other traps and went on. About noon it began to snow and I ran the rest of the line in haste, taking out a mink or a fisher, resetting traps and rebaiting some, and pushed on for my old resting place. I had improved my first night's camp with poles and bark and now had a good warm shelter, free from the snow, which now came thick and fast. Antoine was right. If the storm kept up all night no man could move next day without ah-gim on his feet, and I thought myself in luck. The intense stillness of a snowstorm we have all noticed. How every sound is muffled and all nature seems hushed by its white mantle!

> "Lo! sifted through the winds that blow,
> Down comes the soft and silent snow,
> White petals from the flowers that grow
> In the cold atmosphere.
> These starry blossoms, pure and white,
> Soft falling, falling, through the night,
> Have draped the woods and mere."

The night was grand for sleeping, for it is never very cold when the snow comes in big flakes, and the morn was also grand. The snow had ceased falling and the air was bright and clear. The same silence brooded over the woods and was only emphasized by the tapping of a woodpecker or the hoarse croak of a raven. I would cross the divide and run the line down the other stream after all, for it only meant a few more miles, and then the week's work was done. It was in heavy timber all the way; my old trail was hidden, but I knew the bearings and had only to keep the sun on my right until I struck the stream and then follow it eastward. After breakfast I started. The sun was bright and dazzling, too much so for comfort. The traps were under 20in. of snow, and I dug most of them out with a snowshoe and got a few skins and set things in shape as well as possible. When I stopped for a noon lunch my eyes were so inflamed that they were painful. My soft cap was pulled down in front and I went on in the bright sunshine and the drip of the trees, using one eye at a time, until I could no longer see. I could not be more than two miles from home, but could not avoid logs or choose my steps, and I was in despair. I shot off my rifle and yelled. Surely Antoine should hear a shot that distance in such clear weather. I shot again and again, perhaps a dozen times, and then I heard an answering shot down the valley. My eyes were streaming, and I could not have gone a rod further. It seemed hours before I heard Antoine's inquiring yell and then he found me.

"So you gone snow blin', hey? Why, you don' take some sof' inside bark an' make some spectacle an' make leetly hole in him w'en de ole sun come on a snow, hey?"

"O, Antoine! get me into camp! My eyes are ruined, and I'll never see again! I felt 'em getting weak and sore, but never thought I'd get stone blind, but maybe if I get a chance to rest I'll come out all right."

"Yes, you com-a all right. I t'ink you was got ketch in dead-fall or got into some hole an 'break you laig w'en I hear you shoot nine or 'leven tam. Gimme you' pack an' you' gun, an' keep hol' dis string an' come 'long o' me. Dat snow blin' make no dif' w'en you keep in camp ten day. Come 'long."

And so he towed me into camp by a string, stopping and helping me over a fallen tree or other bad place, for he had bandaged my eyes and all was dark. When we reached the cabin he sat one of the wooden troughs, which his handy axe had made, by me and told me to bathe my eyes with the cool and soft snow water it contained, and not to look at the fire or anything else. A fever came on, and for the first time in my life I knew what it was to be perfectly helpless in a wilderness. Coming into it in the full strength of youth and health, no idea of anything that could disable me ever came to mind. Here I was, laid up and despondent. There was no belief that youth and an iron constitution were sufficient to cure my ills; all I knew was that I was a wreck and a hindrance to my partner.

"I'll tole you dat make no dif'," said Antoine, "you doan min' a-me, keep-a still, I'll got some bark an' stop dat feve', an' you come 'long all rite. I'll tole you, you lie down an' doan min' noding. Keep-a eye shut—dat snow blin' he make no dif', I'll tole you he'll be all right in ten day."

This was consoling, and might be true. Antoine cared for me like a mother. He steeped some bark—perhaps white oak, I knew at the time—and my fever left me in a few days, but my eyes could not even bear the fire light. Ah-se-bun came into the cabin. He was hungry, as usual, for I never saw an Indian that wasn't, and after filling himself with bear meat he rested, and Antoine said: "Ole Miss'r Coon, he says he stay here an' take care you, an' I'll run my trap. Ba gosh, day hain't been run in long tam, I'll guess. I'll tole you der is plenty for heat, an' Miss'r Coon, he mus' cook w'en he got hunger. All you got for do is keep-a eye shut an' wash heem in snow water. I'll be back in t'ree day, an' dere is plenty for heat, an' you eye he make no dif', he come good w'en you doan' go on de snow."

The Ojibwa tongue had seemed very easy to use with Antoine, who could translate what I did not understand. It seemed to be merely to learn another name for a thing, and I had only learned some nouns. To talk with a native was another thing. Ah-se-bun wanted the axe

and came to me and said "Au-gua-kwet?" I answered: "Au-gua-kwet is over behind the pa-que-shi-gun," but in my mixture of English he failed to understand the last word to mean wheat flour, bread or anything else. That kind of talk did first rate with Antoine, but the Raccoon did not understand his own language. That was very queer.

The light in the cabin was very dim when the fire was not bright, for our "windows" consisted of two holes, one in the door and one opposite, over which were stretched the dried "caul," or what surgeons know as the *peritoneum*, of a deer. When the fire was not bright this gave "a dim religious light," such as steals into some silent crypt through stained glass in an old cathedral, and my eyes improved daily. After some days I could get about the room and do a few things, such as washing out my rifle and oiling it, and it was a surprise to see the Indian eat and sleep. He would rouse up and get wood to cook. The provisions were unlimited, as part of the bear was left, and Antoine had buried a deer in the snow. So it was a picnic for our friend, and he did not even have to hunt nor fish.

When Antoine came he whittled a huge pair of spectacles for me out of dry spruce. They were solid except a small longitudinal slit for each eye, through which one could see all that was necessary and all lights from points outside the range of vision were excluded. They were fitted to my eyes with exactness, and where glasses would be in ordinary spectacles there were hollows which were blackened with charcoal, and with these I could venture out even in strong sunlight, and next day I ran my line of traps with them, seeing perfectly everything that I wished to see, unharmed by the light on the snow. The only unusual event on this trip was seeing where several deer had crossed my trail on the jump, followed by some wolves, as shown in the snow. As the deer were yarded up during such deep snow, the wolves must have stampeded some of them; but we had not seen nor heard a wolf in our part of the woods all winter.

Returning to the cabin the day afterward, Antoine said: "I'll tole you, Chris'mas he come to-morrer and we stop home an' heat good Chris'mas dinner; what you say, hey?" and he showed me where he had kept a record of the days on a stick. I had not given a thought to the matter further than to note that it was midwinter by the sun being at its southern limit, but my partner was a more devout man and told his beads at proper times, kept count of the days, and knew that this was Christmas eve. And so it was settled that we should not hunt nor fish on the morrow, but would observe the day in a civilized manner, just as the folks at home were doing. Antoine had hung some evergreens over the fireplace and over the bed, and with thoughts of those at home we crawled under our blankets, and morning came. FRED MATHER.

Words from Old Friends.

POTOSI, Wis., Oct. 19.—*Editor Forest and Stream:* The sketch of Charles Guyon, formerly of this place, was much appreciated here, where he was well known, and it is a subject of comment in this small place; the few copies taken here were soon worn out and others brought from Dubuque and Galena. Judge Seaton has read all the stories of "Men I Have Fished With," and we have talked them over, for we both knew the author in years gone by when he was a youth seeking adventure. I believe the Judge has kept up an occasional correspondence with Major Fred since he left here, and has followed his wanderings in Kansas and his career in the army and in the more peaceful field of fishculture.

John Lyons remembers the boy whose arm was lacerated by the hog which Mr. Mather shot; his name was Marquette. John also saw Charley Guyon's leg after it was torn by the hogs on the island, as related in the story. As the author of these sketches spent a good part of three years in this place, and hunted and fished with many of the men and boys who are well known here, we are wondering who comes next. He trapped one winter with old Antoine Gardapee, and the next winter he went with a surveying party with James McBride, now living in Washington, D. C.; Henry Neaville, who was killed at Antietam; and Thomas Davies, who now lives in the adjoining village of British Hollow. No doubt he will tell of all these trips.

Since writing the above the last FOREST AND STREAM has come, with the admirable sketch of Henry and Frank Neaville. It is even better than the other. D.

A Record Bass for Kentucky.

SOMERSET, Ky., Oct. 21.—*Editor Forest and Stream:* In order that your readers may know something regarding the fine bass fishing which abounds in this immediate vicinity, I give you the result of four days' angling last week by a club of four gentlemen from this city. The entire catch was made in the Cumberland River, seven miles distant from Somerset: On the first day they caught 34, second day 38, third day 64, fourth day 17; total 153. This gives an average catch of 38¼ fish to each man.

These fish run in weight from 1½lbs. to 7lbs. 1½oz., very many of them weighing from 3 to 3½lbs.

Col. R. H. Bartells caught the big bass, and was fourteen minutes engaged with him before he was landed. He made a terrific fight, but he was in the handling of an expert angler and escape was impossible. Col. Bartells is naturally very proud of the catch, as well he may be, for it is the largest black bass ever caught by any angler in these waters. The fact is, I never heard of a larger black bass being taken from any running stream in Kentucky or elsewhere. The fish can now be seen alive and swimming in Col. Bartells's aquarium, this city. S. M. BOONE, SR.

ANGLING NOTES.

Habits of Salmon.

IT was a great pleasure to me to receive a letter from my old friend Mr. John Mowat, in which he tells me of the prospects of his restoration to health. I have told in this column of the serious accident which happened to Mr. Mowat on the Restigouche River as he was returning from salmon fishing and stopped to visit with Mr. Archibald Mitchell, since which time Mr. Mowat's recovery has been slow, but since a visit to Montreal for a consultation with physicians he feels that by another season he may be able to kill a salmon on his favorite river.

I am not alone in thinking Mr. Mowat to be the best-informed man in this country regarding the habits of the sea salmon in Canadian rivers, for I recently heard this opinion given of him in Montreal by a well-known salmon fisherman, and what he knows about the fish was acquired on the rivers and not from books.

With his personal letter Mr. Mowat sends me the following for publication in FOREST AND STREAM:

"The Glens Falls *Sunday Republican* contains an interesting account of salmon fishing, written by Mr. Eugene McCarthy, from his experience on the St. Anne des Monts River (Mr. Hogan's), on the south shore of the St. Lawrence. The article is good, and well describes the fishing from the point of view of a novice, who no doubt believed a good deal of what his guides may have told him.

"I may be in error in correcting some of the statements made by Mr. McCarthy, but my experience of sixty years entitles me to opinions respecting the habits of salmon which I cannot get over. Mr. McCarthy says the salmon spends ten months in salt water, the other two months of the year in fresh water spawning; therefore the salmon is a salt-water fish. Now we know that a salmon will ripen its ova in salt or nearly salt water, but it must have fresh water to deposit the eggs in. Why, sir, only for this peculiarity we would never see a salmon, and the necessity for having fresh water in which to spawn brings every fish back to its own river, another wise provision; for if the fish took the first fresh-water stream they came to, many rivers would be crowded with fish and other rivers would have none. Salmon run in June, less in July, few in August in our north Atlantic rivers.

"Our climate, ice-bound streams for six months, do not permit of autumn fish, 'stragglers' such as they have in the Tweed and Tay in September and October. They are just late fish running up to spawn, almost at the gravid stage. Now the salmon, irrespective of the time of their entering the river, spawn in a week, generally the last week in October, so a June fish is five months in the river getting ready to spawn. In the Restigouche this June fish will be probably 150 miles above salt water at spawning time, and here he will remain until next June, when he makes his way to sea, meeting the new spring fish going up as he goes down. He is then a good-looking kelt, bright as a dollar, but a little lanky; takes the fly well, and shows good fight. I have landed as many as twelve in a day early in June—of course liberating them. Now, sir, from all experiments I have made, those fish do not return that year; keep them, if you wish, in salt water for six months and there will be no signs of ova, only a sediment will appear. There may be a few fish that will return after spawning to sea; they may return, but there is no certainty of their doing so. No salmon ever leaves a river until after spawning, and you can't prevent him from going up. Nets, falls, rapids or rocks will not stop him; but our rivers generally are so easy of ascent that the fish sustains little or no injury. This fact, along with artificial propagation, has made the Restigouche the very best salmon river for sport on this continent. Just think of 100 rods on seventy miles of angling water (the branches reserved for breeding grounds), with average scores of 60, 70, 100 and 120 fish to a rod. I am glad to say the clubs here have restricted their members to eight fish per day. Our grilse here never run over 4lbs. I think an 8lb. fish is a stunted fish. Some rivers only produce 8 and 10lb. fish. Many rivers have no grilse, in that case the returning fish may be four years old. Another strange fact is that any grilse that I have ever seen were males, and seemed always ready to perform their share of duty at spawning time.

"I think when Mr. McCarthy goes again he would better give his fish a little more butt; anything fairly hooked should come to gaff in twenty-five minutes, even with a 3lbs. strain. Always remember to never let your fish get below you; make him fight your rod and the current, with no resting behind rocks. I trust Mr. McCarthy will not take amiss my views on the noblest of sports—fad, if you will—the feel of a 30-pounder when he strikes."

The "Island Pool."

When I started, the very last of August, this year, for Lake St. John, with the intention of fishing the Metabetchouan River for ouananiche, I recalled to memory a description I had read of the road to the Island Pool. My companion, Mr. Rathbone, said the description was given by Dr. Van Dyke in his book "Little Rivers," but I was obliged to confess that I had not read the book, so I did not get my idea of the road from that, and I could not tell where I had read it or heard of it until this morning. I was looking at the file of FOREST AND STREAM for something a correspondent referred me to when my eye caught the note of my friend Chambers in the same issue, Aug. 29, and there it was. Mr. Chambers writes: "In Dr. Van Dyke's 'Little Rivers' is a description of a somewhat difficult route by which he reached the pool, driving by buckboard for nine miles from St. Jerome over an exceedingly rough and hilly road, and then scrambling down a steep hillside 500ft. high."

If Dr. Van Dyke or Mr. Chambers could know how we pictured that road in our minds, from what one had written and the other had quoted, they would give us credit for some courage for undertaking it, particularly when Mr. Beemer wired from Roberval to Quebec that the ouananiche were not yet running up the river and our visit to the Island Pool would in all probability be fruitless of fish. I was not going to the pool for pleasure alone, for I wished to find out something about the fish and their habits at spawning time, and I voted to go if we had to walk. Perhaps that road has been improved since it was described, or perhaps I do not know a bad road when I see it, but I found it to be a very decent road, an for fear some one will get the idea of it that I had before I tried it I wish to say that we dined at Roberval and the same evening went by train to the mouth of the Metabetchouan and slept at the house of the guardian of the river. The next morning Maurice Boivin, the guardian, secured a buckboard attached to a horse a size larger than a sheep, with a driver to take us to the pool. In a little more than two hours' time the little horse hauled three men and the luggage to the shanty where we were to stay, just above the pool. True, the road is hilly, and the last mile or so after leaving the highway it is rough, but it is not a road to be dreaded in the least. I was expecting to find a road after the pattern of some of the log roads in the North Woods of this State, that are deemed extra hazardous in insurance policies, instead of which the road was very good, and returning to St. Jerome with a larger horse we were less than two hours on the road, including a stop to mend the buckboard.

The scramble down the 500ft. to the pool, and more particularly the long haul up, is another matter, and my pen cannot do it justice. One thing is certain: no one with heart trouble should attempt it until a derrick is erected to lift the angler up from the pool. One can get down all right enough, for one has only to let go and he will land at the bottom fast enough, but it is getting back that tests the bellows and the joints. It was raining when I first went down to the pool, and the first time I fell I went down a good part of the way on my back. There is one thing about the pool which gives the descent a redeeming quality, rough and steep as it is, and that is if the ouananiche are there and feeding the angler has no desire to climb back.

Our guides followed the trail up the river and were at the pool when we reached it, and the guides were the guardian and his son. I made the mistake of taking an Indian and a birch canoe from Roberval to the river, but he knew nothing about the stream and I sent him back with his birch before we started up the river. There is a boat on each of the three pools in the river, and the guardian and his sons are the best guides to be obtained.

Ouananiche Flies.

When I was putting my flies on my leader Maurice told me they were too small, and took from his hat what he considered a fly of proper size. His fly was a Jock Scott on a No. 1 hook, and mine were a Jock Scott, silver-doctor, and a fly I got in Quebec under the name of fairy, but which was really an Alexandra, all on No. 10 hooks. I was satisfied that my flies were rather small, but they were the only silver-doctors and Jock Scotts I had except salmon flies as large as those Maurice showed me, and I did not wish to put such flies on a fine leader. We killed fourteen ouananiche that averaged 3lbs. in weight and returned half a dozen or so of small fish to the water. We fished the afternoon of Sept. 1 in the Island Pool, the next day in the Second Pool, and the morning of Sept. 3 in the Island or Third Pool. Sept. 1 and 2 every fish but one was killed on a silver-doctor, whether on Rathbone's rod or my own. The exception was a 3¾lb. ouananiche on an improved Alexandra. The third day every fish was killed on a Jock Scott. Rathbone and I both tried various other flies, and except for a small fish on the alleged fairy which I returned to the water all were taken as I have stated.

There was a brown drake rising on the water and I put on its counterpart, but the fish would not notice it. I caught but one trout in the river and that was on the fairy, and Rathbone caught none. The ouananiche had May fly (drake) larvæ in their stomachs, though they would not touch the fly. Twice I lost flies, or rather the points from them, by the fish taking one of the upper flies and dragging the lower flies around the pool over the rocks, and another time I would not use more than two flies on my cast.

Jumping Ouananiche.

The first ouananiche I hooked, a 2½lb. fish, did not jump once or show above the surface of the water. I knew it was a ouananiche from its play, but it was my first experience with one that did not leap when hooked. The next morning when fishing the second pool Maurice told me of a fish caught there the year before that jumped fourteen times. In the afternoon I hooked a ouananiche of 3¾lbs. in the pool that jumped fairly above the water twelve times. Mr. Rathbone and his guide were below me, and each counted the leaps, one counting aloud in English and the other in French. Besides the clean jumps the fish rolled out of water two or three times. Within half an hour Rathbone hooked a fish of 3½lbs. in the rapids and it did not jump once.

Temperature.

On my first visit to Lake St. John for ouananiche I satisfied myself that the fish remained in shallow water or at the surface, because the water was cold and they were not driven to the depths by warm surface water. I had no thermometer, but I judged from putting my hand in it that it was not above 54°. Mr. Chambers has quoted in his book, "The Ouananiche and its Canadian Environment," what I said of it at the time. This was at the Grand Discharge the last of August. This year on Sept. 1 I tried the water in the Island Pool at noon, and it was 55°, while the air temperature was 50°. While I was testing the water and air a hailstorm passed over, and it was not a fair test of the air, for two hours later it was 54°; but 55° was correct for the water during our stay. The fish that we killed had hard roe and milt, and would not have spawned under six or seven weeks at the least.

Mending a Fly.

After the ouananiche had broken the point of one of my flies by dragging it round the pool behind him, and the fish was netted, I took off the broken fly and threw it on the ground. It was a new fly, but the point of the hook was gone. Maurice picked up the fly and put it in his hat, saying that he would mend it. I asked how such a fly could be mended to be of service, and he took a mended fly from his hat to show me. The broken hook was filed off just above the bend, leaving a small piece of the shank exposed below the body, another hook of the same size was placed along the fly and the end of the shank whipped with waxed thread to the end of the shank of the broken fly, and again the hooks were whipped together just below the body. It made a strong, serviceable fly, and the fact that a bare hook was lashed on alongside the broken fly was not at first discernable. The thing was new to me, but well worth knowing when an angler

is far from a tackle shop and the fish are taking one particular fly, of which the supply in the fly book is limited.

Cooking Ouananiche in Bark.

One evening I said to Maurice, in the shanty: "Can you cook a fish on the river to-morrow if we get one?" "Oh, yes; cook it in bark."

The next morning, while we tumbled, slipped and fell to the bottom of the gorge where the pool holds court, Maurice remained behind to prepare for cooking a fish, but he appeared soon after we got the rods together. My first fish was too large for two people to eat, he said, but the next was just 2½lbs., which Maurice thought would be just right. Evidently he had confidence that we would kill fish that morning, for he started a fire before he had been on the island five minutes. The fire was in a trench in the sand, the trench being 2½ft. long and 2ft. wide, and about 1ft. deep. The fish was cleaned and scaled, and crimped with one long cut lengthwise of the fish above the backbone, and sprinkled with pepper and salt. It was then wrapped or rolled in a square sheet of birch bark and the ends of the bark folded over on the fish, and thus rolled it was placed folded ends down on a second square of bark, and again rolled in it. The folded ends of the second sheet of bark were tied down with roots, and the fish was wrapped about with root strings at intervals between the head and tail. The burning sticks were taken from the trench, and with his paddle Maurice dug a place in the hot sand to receive the fish and its wrappings of bark. The hot sand was drawn over the fish and the wood was replaced and fanned to a blaze over the fish. He said it would take twenty minutes to cook the fish, and I held the watch on him, as he had no watch, and I wondered how he would know when twenty minutes had elapsed. In twenty-three minutes he said the fish was done, and again he removed the wood, drew the ashes (few, by the way) and sand from around the wrapped fish, and exposed a dirty-looking package. Cutting the roots, he removed the outer bark and the ends, and picked and cut and turned the package between two paddles until he revealed the fish in its inner wrapping of clean bark, and placed it on a box before us. The bark formed a platter for the juices of the fish. The skin was removed, and butter, salt and pepper spread and sprinkled over the fish, and Rathbone began at one end of it with knife and fork and I at the other with similar tools, and we ate until we met in the middle of the fish and there was nothing left but bones. Then we wished that Maurice had cooked a larger fish, for I never ate a better one of any kind anywhere on this beautiful green earth.

Ouananiche and Grasshoppers.

Maurice was preparing our luncheon at the Second Pool and I saw a break in the *brou* just above our landing and took my rod with me to see what it was. After a few casts I hooked a chub, which ended my fishing, and I sat down on a rock near the water where I could talk to Maurice.

A larvæ of the brown drake crawled up on a stone at my feet, split its encasing skin and spread its wings, and just then the water washed a little higher on the rock, bringing with it some *brou* which enveloped the poor little beggar of a drake and flattened and stuck his wings to the rock. I tried to help him out of his troubles and put him up on a log to dry where he would not be entangled in the foam. Maurice said it was something he could not understand, but ouananiche would not eat what other fish esteemed a delicacy. He tried them with grasshoppers on one occasion when the fish were feeding, but he could not get a single strike, and when finally he emptied his box of kicking, struggling grasshoppers on the water, and they floated down where the ouananiche were jumping, not one was taken by a fish.

Pike-perch run up to the Island Pool of the Metabetchouan, and this pool is just below the falls which bar even the ouananiche, but the rapids which the pike-perch overcome in reaching the Third Pool prove a barrier to the pike and none have ever been seen in any of the pools. Crayfish I found in abundance in the river and chubs are plentiful. Rathbone caught one very large chub at the Second Pool and did not kill him. Maurice says that when the ouananiche are spawning in the Third Pool the chubs fairly swarm on the beds and eat the spawn, and the ouananiche pay no attention to them, while at other times if a chub approaches a ouananiche the latter fish will drive him away.

We saw many young ouananiche in the pools jumping for flies, and we caught several as small as half a pound each or about that weight. These little fish could not have been down to the lake and must have been two years old, but they must have had an abundance of superior food to attain the size they had grown to in that time, for I have seen two-year-old sea salmon not more than half as large. The climb down to the Second Pool is not so difficult as that to the Island Pool, but for the sake of fishing from the island I would make the descent if it were even steeper.

Later Fishing on the River.

We were early for the best fishing in the Metabetchouan, and when we got back to Roverval I found a note from Mr. Merritt E. Haviland, of New York, who, with Dr. Hamilton, went up on the train with us from Quebec, asking if I would advise him to go to the river when they returned from the Saguenay. I left a note for him, advising him to go, as I thought he would just about hit the run of ouananiche. Since my return home I have received the following letter from Mr. Haviland:

"Dr. Hamilton and myself were very much obliged for the note which you left at the Hotel Roberval, and were also pleased to learn of your success on the Metabetchouan.

"We stayed there several days, but our average was not as good as yours, except as to weight of fish, which was about the same. Dr. Hamilton killed thirteen and I killed thirty-six ouananiche. He was there six days and I eleven. He left me, and I went to Lake Kenogami for trout. There I had fairly good success. The number few, but the average good, although my heaviest fish was only 4lbs. The day before I left the Metabetchouan Dr. Van Dyke, of New York, and his friend arrived and spent one night there. They had just come from Kenogami, and reported good success, so I went there. There were plenty of fish, but they would not rise freely to the fly, and were logy. As compared to ouananiche it was tame sport. We did try the First Pool, notwithstanding Mr. Rathbone's suggestion that the road to it was practically impossible, and we had very good luck there.

"Dr. Hamilton and I noted the emphasis which you placed upon the statement of your having landed all the ouananiche you hooked. We appreciated this later when we were not as successful."

If I placed emphasis upon the fact that I landed all the ouananiche I hooked I have forgotten it. When I first went to Lake St. John I was informed that if I saved two or three or four fish out of five hooked (I cannot now tell the proportion), I would be lucky. When I did not lose a single fish hooked on a fly (I did lose some when I trolled for the fish with a spoon in the lake, and a man who fishes for ouananiche with a spoon deserves to lose them) I thought I was particularly favored, and this year neither Mr. Rathbone nor I lost a single fish that we hooked, and we considered ourselves particularly fortunate. But after my short experience, I do not know why a fisherman should lose a ouananiche properly hooked, if his tackle is sound, any quicker than any other game fish; still I may find out the next time I fish for them.

A. N. CHENEY.

Honeoye Falls Anglers.

HONEOYE FALLS, Oct. 23.—The annual banquet of the Honeoye Falls Anglers' Association was held in the Wilcox House last evening. Covers were laid for 100 members and guests. The large dining hall was finely decorated with flags and the various implements employed in hunting and angling. After the feasting was over the reports of the officers of the Association were given by President Mather and Secretary L. E Gates. It was stated that the object of the Association was the propagation of fish and game in this vicinity and the suppression of illegal fishing and hunting. Secretary Gates stated that during the past year there had been placed in the waters of this vicinity the following fry: Honeoye Creek, 120,000 wall-eyed pike; Lima ponds, 20,000; Mendon ponds, 40,000. Five thousand brown trout fry and 250 yearling trout had also been placed in the Mendon ponds. In addition to this work the Association had brought about the arrest and conviction of a number of illegal fishermen.

The Kennel.

FIXTURES.

BENCH SHOWS.

Dec. 1 to 4.—City of the Straits Kennel Club's local show, Detriot, Mich. R. H. Roberts, Sec'y.

Dec. 8 to 11.—Augusta, Ga.—Georgia Poultry and Pet Stock Association. J. W. Killingsworth, Sec'y.

Dec. 15 to 18.—Central Michigan Poultry and Pet Stock Association's show, Lansing, Mich. C. H. Crane, Sec'y.

FIELD TRIALS.

Nov. 2.—Oxford, Mass.—New England Beagle Club's trials. W. S. Clark, Sec'y, Linden, Mass.

Nov. 2.—Carlisle, Ind.—Union Field Trial Club's inaugural trials. P. T. Madison, Sec'y, Indianapolis, Ind.

Nov. 10.—Columbus, Wis.—Northwestern Beagle Club's trials. Louis Steffen, Sec'y, Milwaukee.

Nov. 10.—Leamington, Ont.—Peninsular Field Tria Club, Leamington, Ont.

Nov. 10.—Waynesburg, Greene County, Pa.—Central Beagle Club's trials. L. O. Seidle, Sec'y.

Nov. 16.—National Fox Hunting Association's third annual trials, Bardstown, Ky. F. J. Hagan, Sec'y.

Nov. 16.—Newton, N. C.—E. F. T. Club's trials. S. C. Bradley, Sec'y, Greenfield Hill, Conn.

Nov. 17.—Chatham, Ont.—International Field Trial Club's trials. W. B. Wells, Sec'y, Chatham, Ont.

Nov. 20.—Thomasville, N. C.—Philadelphia Kennel Club's trials. Dr. Alexander Glass, Sec'y, 2125 Sansom street, Philadelphia.

Nov. 23.—Newton, N. C.—U. S. F. T. Club's fall trials. W. B. Stafford, Sec'y.

Dec. 14.—Athens, Ala.—Dixie Red Fox Club's second annual trials J. H. Wallace, Sec'y, Huntsville, Ala.

1897.

Jan. 11.—Tupela, Miss.—Continental Field Trial Club's quail trials. P. T. Madison, Sec'y.

Jan. 18.—West Point, Miss.—U. S. F. T. C. winter trials. W. B. Stafford, Sec'y, Trenton, Tenn.

ME AND THE PUP.

OMAHA, Neb.—*Editor Forest and Stream:* A pup is a curious critter—almost as much so as some men I have had the good fortune to meet, and I have had lots of experience with both. With the four-legged variety it has covered the entire range from very good to very bad, sometimes, in truth, worse than very bad, and candor compels me to state that most of them come under the latter heading.

I once owned an Irish setter of unimpeachable ancestors—a regular swell, so to speak—and when I first brought him home great was the rejoicing. Well, we took him out hunting, just to make the other fellows who thought they owned good dogs feel sorry for themselves; but somehow it didn't have the desired effect, while those common meat dogs who didn't have a paternal ancestor among them that they cared to introduce in polite society just humped themselves around the stubble fields and found all kinds of birds. My beautiful sprig of gentility walked disdainfully under the wagon and carried his nose very high in the air; still, I had faith in him. Perhaps he was just waiting for them to show their ignorance, and then intended to start in and show them how the thing should be properly done; perhaps those were his thoughts, but if so, he never had a chance to show us, for just about that time some one shot a chicken close to the wagon, and there was an indistinct red streak seen going over the top of the hill, and we found him brooding over his grievances under the front porch when we got home. Two days later he followed a farmer's wagon off, and we haven't seen him since. That was three years ago, and I suppose he is still my dog, though I never hunted for him hard enough to find him.

My next was a pointer bitch. She had, and still has, her good and bad points, for I own her still. She is a fair quail dog, but for other birds she—but she is a lady, and I'll say no more.

But I started out to tell you about the pup. He's great. Such a pedigree was never before seen. All the blue blood and greatness in the English setter race is concentrated in this precious pup of mine. I saw him when with his brothers and sisters he had just opened his eyes on this cruel world, and as I looked over the kennel fence (his mother was a little quick-tempered) my heart yearned for him, and I bought him then and there. On account of his youth I left him with his mother for a time, but the other day, being in the place of his nativity, I concluded that as he was six months old he had better come home and begin his education. The man who raised him suggested that we had better put him in a crate and ship him by express, but I was afraid to trust such a valuable package to the tender mercies of an express company, and as I expected to be home in a couple of days, I thought the occasion good to make his acquaintance and get used to each other's little idiosyncrasies. The first part of the journey was by stage, and by the way he curled up on the mail sacks and made himself at home I erroneously concluded that he was a philosopher. His breakfast had consisted of mush and milk, mostly milk, I think, and as we progressed the jolting of the stage seemed to have a disturbing effect. It made him seasick, and the driver was tickled to death.

The next part of our route was by rail, and we stood on the platform patiently waiting for the train. Pup was still feeling slightly indisposed, but he kept his weather eye open for emergencies. Presently the train came rushing in, steam escaping and whistle blowing, and it scared the pup almost to death; and as the rope I held was strong, instead of bolting he went straight up in the air about 4ft. It was with the utmost difficulty that we got him on the train, but I did at last, and fondly thought the worst was over; but it wasn't. We made him a nice bed in the basement for the night, gave him his supper and tucked him in. He kept reasonably quiet, for a wonder, though he did howl once in a while.

The next day was Sunday, and for the purpose of getting him used to his surroundings he spent the day *en famille.* During the afternoon it clouded up and began to rain and we had to come in the house, and for fear he would run away brought the pup in too. There is where we made a mistake, for when his bedtime came, and we put him back in his quarters, he refused to be comforted and set up the most dismal howling ever heard. During the day a member of the family had had a dangerous surgical operation performed and the doctors enjoined perfect quiet, and that pup wouldn't do a thing but howl. We tried all sorts of expedients. We even got another dog to keep him company; but it was no use—the only place he would stay was at the top of the basement stairs, and there his high tenor notes rang out loud and clear. This would never do, for it drove the sick man frantic, and to add to the general discomfort a heavy thunderstorm came up, and at every peal of thunder the pup raised his voice the louder. He craved society, and the only way in which we could quiet him was to admit him to the family circle. There he became as docile and lamblike as our fondest hopes could wish, and he settled down and slept the sleep of the righteous.

Bedtime finally came, but do you think Jerry would consent to sleep alone? Not much. I had dark thoughts of taking him out and losing him, but it was raining too hard, and I didn't, and to pacify him finally admitted him to the bedroom. When I finally retired, after putting out the lights, and sank to repose, I imagined that my troubles were over for the night, but I failed to consult the wishes of our canine friend. He didn't like the darkness, and wandered around like a lost soul, bumping his head into every piece of furniture in the room, and capping the climax by pushing his damp, inquiring nose into the face of my sleeping spouse. After her fright was over she said some very severe and uncomplimentary things about pups in general and this one in particular. Then I rose in my wrath and yanked that pup up by the scruff of his neck into the next room and lit the gas for his benefit. That seemed to suit him better, and I left him to his own reflections. He made himself a soft bed in my wife's silk couch pillows and settled down. She doesn't know it, and I fervently, oh, so fervently, hope she never will.

Daylight at length came and with it renewed activity on the part of the purp; in his tour of investigation he concluded to get into bed with my young son, and as the kid didn't wake up and the pup kept quiet, I let him alone.

Promptly after breakfast I tied a string to his collar and led him down town, where he had difficulties with electric cars and bicycles, and wanted to bolt into every open door he saw. After much search I found a colored gentleman who consented to take his education in charge for a consideration; he didn't know what a contract he undertook. I saw him again the other day and he looked very sad; he informed me incidentally that the job was worth more money, and broke it to me gently that my blue-blooded Jerry was about the worst gun-shy dog he had ever seen.

W. R. HALL.

Field Trials and Field Dogs.

SHERRILL'S FORD, N. C., Oct. 18.—*Editor Forest and Stream:* I think the article in last week's issue under "Field Trials and Field Dogs" just a little bit rough, in making the statement that field trial dogs have not improved in their manner of doing the work required in field shooting, or come up to the sportsman's standard, as he should have done.

Is it the dog himself who has lost ground in the opinion of those who once supported him? or is it the expense and uncertainty of winning at a field trial? or perhaps, as is often the case, the simple tiring of a hobby that has been taken up and dropped?

I claim and always shall believe that the field trial winner is the best and most perfect of all shooting dogs; that is, that he will give you more shots in one day and do it in better style than the ordinary dog. In cases where this does not happen so, the so-called plug shooting dog would be a winner if run in competition. I will mention a few of the winners of last year that I can remember, and the writer, who evidently follows field trials, must admit from what he saw of them that anyone would make a most charming shooting dog, and furthermore, I will venture to say, all of them can be handled with only a toot of the whistle and wave of the arm when the dog throws up his head to locate his handler. What more perfect dog than Jingo (who was sold as a shooting dog), Minnie T., Count Gladstone IV., India, Nabob, Rip Saw, Delhi, Tamarac, Jr., Von Gull; and if old Rip Rap is not a good rough-and-tumble shooting dog that will give you every shot possible, then I never saw one.

All that is said of bad, improper breaking and unnecessary whistling at field trials and the advantages and disadvantages obtained therefrom is perfectly true, but there is no reason whatever for any of it. The rules and regulations amply provide for all of this, and it rests with the

judges entirely to put their feet down. (Bradley need only put down one foot.) Few care to do this, as the position of judge is not a pleasant one at any time. However, I honestly think these abuses are seen much less than in former years, and if the judges will exercise their authority a little more I predict the competitors will be better broken and handled more quietly.

C. E. BUCKLE.

BRUNSWICK FUR CLUB'S TRIALS.

THE Brunswick Fur Club held its eighth annual field trials at Barre, Mass., Oct. 19 to 23. The entry list was larger than it was in 1895, and the attendance was excellent. Among those present during the week were: A. C. Heffenger, W. A. Bragdon, Portsmouth, N. H.; O. F. Joslin, Oxford, Mass.; E. W. and F. W. Gill, Princeton, Mass.; A. B. F. Kinney, G. A. Goddard, Guy C. Whidden, C. L. Kinney, J. H. Sewell, G. R. Manderson, Worcester, Mass.; J. E. McFadden, Ohio; E. L Brooks, Vernon, Vt.; Chadwick Shaw, Indian Orchard, Mass.; W. C. Carr, Ludlow, Mass.; B. P. Williamson, Green Harbor, Mass.; G. E. Carr, Holliston, Mass.; H. L. Aldrich, Sheldonville, Mass.; J. B. Miller, Diamond Hill, R. I.; Noel E Money, Oakland, N. J.; A. B. McGregor, Poland, Me.; N. Stewart, F. W. Sadlier, Gorham, N. H.; J. W. Slattery, Geo. H. Sargent, Boston, Mass.; J. William Jones, S. B. Mills, Needham, Mass.; R. D. Perry, E. J. Hill, Phillipston, Mass.; James Cotton, Athol, Mass.; J. H. Taylor, Concord, N. H.; Allen Chamberlain, E. H. Garrett, Winchester, Mass.; T. S. Winston, Virginia; C. L. Wellington, Waltham, Mass.; E. Clark, Lynn, Mass.; Bradford S. Turpin, Roxbury, Mass.

The quality of the hounds as a whole in both the Derby and All-Age stakes was better than ever before. The record made by Flash was phenomenal. In the Derby this youngster did not show to advantage, and this was probably due to the fact that she had been crated for a number of days. Her work in that stake, however, put her in splendid form, and in the All-Age she ran like a whirlwind, showing nose, speed and endurance. She is by Lead—Imported Clara, and was bred by Walker & Hagan.

Torment, the winner of second honors, was bred by the Bourbon Kennels. He is a hound that can win on the bench, and in the field showed wonderful speed and great endurance. Clay and Dan are well known. Marquis is a good example of the rough Welsh hounds. He was bred by John Lawrence, the M. F. H. of the Llangibby Hunt. He showed great courage and endurance, running throughout the three days' hunt with a badly cut foot, yet he was always working and was invariably found in at the finish.

Fleet, the Derby winner, was bred by Mr. Decatur, her owner. She is a well set up, handsome hound, but not the equal on the bench of Trim, the winner of second. The latter is a Walker hound, and is strong in the blood of the celebrated Scott.

The judges were kept busy throughout the week, and though their task was a hard one their decisions were received without adverse criticism. Two of the judges were on horseback, and were thus able to cut off the pack frequently when the chase crossed the roads. Indeed, had it not been for the stone walls, there was but little of the country that could not have been ridden. Foxes were easily found.

The hounds were distinguished from one another by letters painted upon their sides in red. This added nothing to the beauty of the pack, but was a great aid to the judges in their work. The country about Barre is a beautiful one to hunt, and the week was one of glorious sport.

Entries for the Derby closed on Monday evening and were as follows:

Derby Entries.

JOE FORESTER, JR.—Dr. A. C. Heffenger's b., w. and t. dog, 12 mos. old (Joe Forester—Annie Dance).
WALKER'S LOUIS—B. P. Williamson's b., w. and t. dog, 19 mos. old (Brewer—Molly).
FLIRT—Diamond Hill Kennels' b. and w. bitch, 14 mos. old (Commodore—Belva).
FLY—Diamond Hill Kennels' b., w. and t. bitch, 14 mos. old (Commodore—Belva).
BEN HUR—O. F. Joslin's b., w. and t. dog, 15 mos. old (Rock—Juliette).
TRIM—A. B. F. Kinney's b., w. and t. dog, 17 mos. old (Big Strive—Erminie).
LOBO—S. Decatur's b., w. and t. dog, 21 mos. old (Duke—Kate).
FLEET—S. Decatur's b., w. and t. bitch, 21 mos. old (Duke—Kate).
JET—Walker & Hagan's b. and t. bitch, 18 mos. old (Brewer—Sall).
FLASH—Walker & Hagan's b. and t. bitch, 16 mos. old (Lead—Imported Clara).

The Derby—Tuesday.

The morning was cool and cloudy, with no wind. The Derby entries were cast off at 6:30 o'clock on the Rowell farm, and at once struck a cold track. They trailed at speed for a mile or more, and within fifteen minutes jumped the fox. In working up to the fox the hounds packed well and worked eagerly, but Fleet and Trim did the best and showed the greatest judgment. The start was an unusually pretty one, the hounds being well packed and the fox running within a few yards of the spectators when he broke cover. From the first the chase was a hot one, and the fox was glad to seek refuge in a large swamp, where the hounds could not press him so hard. Before the swamp was reached Joe Forester, Jr., Ben Hur and Walker's Louis were thrown out at a check and did not get in again for an hour or more. Meantime the youngsters were put to a severe test in the swamp, and did work of which experienced hounds might have been proud. In working the losses Trim, Fleet, Flash and Fly all did well, and indeed there was not a bad hound in the pack. At last the fox was driven from the swamp, and with all ten hounds at his heels returned to his starting point. The pack was still running beautifully, Fleet and Jet doing the greater part of the leading. The fox had now run for two hours and a half, and the pace was telling on him. His brush was lowered, and he was looking only for a place of refuge. So hard pressed was he that he ran close by two of the hunters, paying no heed to them, and at 9:45 he went to earth.

This was by far the best Derby race in the history of the Brunswick Fur Club. Where all the hounds were so well matched it was not easy to decide upon the winners, and the task of the judges—Noel E. Money, R. D. Perry, S. B. Mills, J. W. Jones, N. Stewart, E. L. Brooks and Bradford S. Turpin—was a difficult one.

After careful consideration they gave first prize to Fleet, second to Trim, and divided third between Jet and Lobo. Fleet by winning first prize became the possessor of the R. D. Perry cup and N. Q. Pope's handsome medal.

SUMMARY.

BARRE, Mass., Oct. 20.—The Derby, open to all foxhounds whelped on or after Jan. 1, 1895. Entry fee $2. First prize 35 per cent., second 25 per cent., third 15 per cent. of entry fees; ten starters.

Winners.—1. Fleet (Duke—Kate). 2. Trim (Big Strive—Erminie). 3. Jet (Brewer—Sall) and Lobo (Duke—Kate). Special prizes—The R. D. Perry cup and N. Q. Pope's medal to Fleet.

In the evening the entries for the All-Age Stake were made as follows:

All-Age Stake.

DOCK—W. A. Bragdon's b., w. and t. dog (Strive—Rate).
TORMENT—A. C. Heffenger's b., w. and t. dog (Redstone—Nell).
GEORGE—R. Seely's b. and w. dog (Wheeler—Kate).
DAN—O. F. Joslin's b., w. and t. dog (Boston—Nell).
SIM—O. F. Joslin's b., w. and t. dog (Jake—Cricket).
BEAUTY—Diamond Hill Kennels' b. t. bitch (Hunter—Belva).
MARQUIS—Noel E. Money's w., l. and g. dog (Manager—Dainty).
ROCK—George E. Carr's b., w. and t. dog (Smitha's Logan—Muse).
CLAY—White Oak Hill Kennels' w., b. and t. dog (Scully—Bessie).
DUKE—White Oak Hill Kennels' w., b. and t. dog (Rabbit—Fanny).
POPE'S STRIVE—White Oak Hill Kennels' w., b. and t. dog (Clay—Sunmaid).
POPE'S SAMSON—White Oak Hill Kennels' w., b. and t. dog (Clay—Sunmaid).
SONGSTER—Bragdon & McGregor's w., b. and t. dog (Shamrock—Dutiful).
LOBO—S. Decatur's b., w. and t. dog (Duke—Kate).
SHINE—B. P. Williamson's w. and l. dog (Grant—Shiny).
HUSKIE—R. D. Perry's b. and t. dog (Troupe—Blinkey).
SPRAGUE—A. B. F. Kinney's b. and t. dog (Clinker—Fan).
KING—Chadwick Shaw's br. and w. dog (Cull— ——).
JET—Walker & Hagan's b. and t. bitch (Brewer—Sall).
FLASH—Walker & Hagan's b. and t. bitch (Lead—Clara).
OSIE—Walker & Hagan's b. and t. bitch (Sam—Mag).
CROOK—Walker & Hagan's b., w. and t. dog (Jake—M'Liss).

The All-Age Stake—Wednesday.

When the line left headquarters at 6 o'clock thick clouds covered the sky, and before the hounds were cast off rain began to fall. Heavy showers followed one another in quick succession and most of the party were thoroughly drenched.

The judges in the stake were: Guy Whidden, Jas. W. Slattery, S. B. Mills, J. Wm. Jones, N. Stewart, E. L. Brooks and Bradford S. Turpin. The hounds were sent away at 6:45, and worked for an hour or more in the heavy rain before they found a track that could be carried. By that time the pack was widely scattered, and most of the spectators had sought shelter in barns and farm houses. At 8 o'clock Judge Mills saw a fox break from cover, driven by Clay, Torment, Flash, Shine, Jet, Pope's Strive, and one or two other hounds. The pack was in full cry, and driving well despite the heavy rain. Other hounds harked in, and soon a pack of fifteen hounds were sending reynard along at a great pace. He made a wide circle, and in an hour returned to his starting point. The pack was then led by Torment, who was only about 50yds. behind the fox, and in the open caught sight of him. The coursing match was a brief one, for a convenient stone wall and bushy pasture saved the quarry. The race was a furious one till the fox went to earth not long after.

A meeting of the judges was held in the afternoon, and it was decided to order out all the hounds in the All-Age Stake on Thursday morning.

Thursday.

The storm was over. The morning dawned still, clear and cold, but a stiff breeze arose not long after sunrise, and somewhat marred the enjoyment of the day.

As usual, the hounds were cast off on the Rowell farm at 6:35. Two trails were found before the hounds had gone a quarter of a mile, and while two or three of the hounds carried one, the rest of the pack picked out the other. Both foxes were started, and both ran across Smith's swamp to the hills beyond. One recrossed the southern end, and was then driven by ten or a dozen hounds, with Pope's Samson and Flash in the lead.

When this chase had gone far to the east, Marquis, Sim and Torment followed a cold trail into Smith's swamp, and after some good work put up their fox and drove him evenly and prettily till he went to earth in the vicinity of Sherman Hill.

Not long after that pack had gone out of hearing Clay and two other hounds jumped a fox which crossed the Petersham road and disappeared in the woods on the west side of Smith's swamp. Another fox a little later in the day was seen running over the same course and ten minutes later a number of hounds widely scattered came swiftly along on his trail.

Hardly had they reached the woods when Jet, Rock and Flash drove a fox within easy hearing distance of the scattered hounds. They harked in at once and a pretty chase was on immediately. The fox was driven beyond the reservoir, where he was lost or went to earth.

In the evening the judges held a meeting and spotted out George, Beauty, Duke, Songster, Lobo, Shine, Sprague, King, Osie, Crook and Huskie.

Friday.

Friday was an excellent hunting day, cloudy, still and damp. The pack consisted of nine hounds. Eleven were eligible to run, but Flash and Jet had not come in from yesterday's hunt and all efforts to find them had failed.

The hounds were cast off at the Rowell farm at 6:30, and almost at once found a cold trail. Carefully they worked it along, sometimes at speed, but usually with difficulty. There were many checks, but the track was never lost for long, and after trailing for many miles the fox was jumped at 9:15. Scent lay well and the running was furious from the very start. After an hour's driving Torment led the pack, with Dan second and far behind. Then came Clay and the others well strung out. After running an hour a bad check occurred and the hounds got together. Then with a wonderful burst of speed and with some of the finest music of the week they forced the fox to earth within an hour and a quarter of the jump.

In the afternoon the judges made the awards as given below in the summary. Under the running rules of the club Flash was given credit for the work done on the first two days of the trials, though she had not run on the third day.

SUMMARY.

BARRE, Oct. 21–23.—All-Age Stake, open to all foxhounds. Fee to start, $3. First prize 35 per cent., second 25 per cent., and third 15 per cent. of entry fees. Twenty-two starters.

Hunting Class.—1. Torment (Redstone—Nell). 2. Clay (Scully—Bessie). 3. Marquis (Manager—Dainty).

Trailing Class.—1. Walker & Hagan's Flash (Lead—Clara). 2. Dan (Boston—Nell). 3. Torment (Redstone—Nell).

Speed Class.—1. Walker & Hagan's Flash (Lead—Clara). 2. Torment (Redstone—Nell). 3. Jet (Brewer—Sall).

Endurance Class.—1. Marquis (Manager—Dainty). 2. Clay (Scully—Bessie). 3. Torment (Redstone—Nell).

Tonguing Class.—1. Clay (Scully—Bessie). 2. Flash (Lead—Clara). 3. Marquis (Manager—Dainty).

Special Prizes.—*American Field* cup and highest general average medal to Flash. A. C. Heffenger's hunting medal to Torment. W. A. Bragdon's trailing medal to Flash. O. F. Joslin's speed medal to Flash. A. B. F. Kinney's endurance medal to Marquis.

A club meeting was held in the evening, Dr. Heffenger in the chair. The definition of trailing in the running rules was changed so as to read: "Trailing shall be considered the manner in which a hound follows a track before the fox is jumped." It was also voted to change the name of the Speed class to Speed and Driving class.

Resolutions of respect to two deceased members, Dr. N. Rowe and Geo. P. Berry, were passed and ordered placed in the club records. R. D. Perry, W. A. Bragdon and Geo. E. Carr were appointed to decide on time and place for the winter meet. James Cotton, Athol, Mass., was elected to membership and the meeting adjourned.

Most of the sportsmen left Barre on Saturday morning and the trials of '96 were a thing of the past. J. A. B.

NEW ENGLAND BEAGLE CLUB.

Editor Forest and Stream:

The following special prizes have been donated, to be competed for at the fourth annual field trials of the New England Beagle Club:

A. D. Fisk offers framed picture, "A Sporting Scene," for best 13in. Derby entry. H. S. Joslin offers $10 in gold for best combination of speed and nose; also pair of zebra skin hunting shoes for best Derby entry owned by non-member; also engraved silk ribbon for the most wonderful story told during the trials. Awashonk Kennels offer service of Baronet to best trailer. Thomas Shallcross offers shipping crate for best pair field beagles owned by one exhibitor or kennel. Geo. F. Reed offers service of Harker to the best bitch marking her game in the ground or wall by giving tongue; also service of Colonel Lee to the best handler. Robert Hindle, Jr., offers hunting coat for best 13in. All-Age entry. Dawson & Co., dealers in sporting goods, Providence, R. I., offer leather-tipped gun case for best 15in. entry owned in Rhode Island. Howard Almy offers box of cigars for best combination of speed and nose. W. S. Clark offers a half dozen regulation bench chains for best 15in. Derby entry. W. E. Deane offers seven-shot double action revolver for best in Class A. C. O. Smith offers service of Laick's Roy for best 13in. bitch. Henry Hanson offers assorted lot of Spratts dog medicines for best All-Age 13in. bitch.

The regular club specials are as follows: An engraved silk ribbon to the best starter, best trailer, best voice, best Derby entry bred by owner, most stylish worker, and greatest sustained speed.

Entries to the fourth annual field trials of the New England Beagle Club closed Oct. 15, with twenty-eight nominations, as follows:

Class A: For all-age dogs and bitches, 15 to 13in. in height, that have never won first prize at a recognized field trial in the All-Age class.

BARONET—Awashonk Kennels' b., w. and t. dog (Daunter—Racklass).
SNYDER III.—H. S. Joslin's b. t. dog (Snyder II.—Nancy).
PHANTOM—A. D. Fisk's w., b. and t. dog (Clyde—Brummy).
DIXIE R.—E. C. Cook's b., w. and t. bitch (—— —— ——).
LEWIS—Howard Almy's w. and t. dog (Bannerman—Parthenia).
NELL R.—Geo. F. Reed's w., b. and t. bitch (Ned—Haida).
SCORCHER—Geo. F. Reed's w., b. and t. bitch (Wanderer—Triumph).
FANNEY—Geo. E. Williams, Jr.'s w., b. and t. bitch (—— — ——).
TWEED—Geo. A. Clark's c. and w. dog (Jack—Fannie).
DIME—William Saxby's b. t. bitch (Judge—Babey).

Class B: For all-age dogs and bitches 13in. and under in height. Same conditions as Class A.

TRILLESS—Awashonk Kennels' b. t. bitch (Laick—Sweet Fern).
DRUMMER BOY—Deane & Smith's b. t. dog (Rove—Wenonah).
BLOSSOM—A. D. Fisk's w., b. and t. bitch (Fitzhugh Lee—Lady Novice).
NANCY LEE—Howard Almy's b., w. and t. bitch (Fitzhugh Lee—Jude).
SKIP II.—Howard Almy's b., w. and t. bitch (Buckshot—Jute).
TOPSY GLENWOOD—W. E. Deane's w., b. and t. t. bitch (Rove—Wenonah).
SNIFTER R. D.—Geo. F. Reed's b., w. and t. bitch (Wanderer—Triumph).
BESSEY—William Saxby's b., w. and t. bitch (Judge—Babey).

Class C: Derby for dogs and bitches, 15 to 13in. in height, whelped on or after Jan. 1, 1895.

STARLIGHT—Awashonk Kennels' b., w. and t. dog (Zeno—Fanny Reed).
TRICK—H. S. Joslin's b., w. and t. dog (Clyde—Lady Novice).
WHALER—H. S. Joslin's b., w. and t. bitch (Wanderer—Triumph).
MISS QUINN—Howard Almy's b., w. and t. bitch (Diamond—Nancy Lee).
SCORCHER—Geo. F. Reed's b., w. and t. bitch (Wanderer—Triumph).

Class D: Derby for dogs and bitches 13in. and under in height. Same conditions as Class C.

TRILLESS—Awashonk Kennels' b. t. bitch (Laick—Sweet Fern).

IDA NOVICE—Mr. A. H. Morse's w., b. and t. bitch (Clyde—Lady Novice).

GLENWOOD—W. E. Deane's w., b. and t. dog (Little Corporal—Frances).

CLARINET—Howard Almy's b., w. and t. dog (Clarion of Glenrose—Trill).

TOPSY GLENWOOD—W. E. Deane's w., b. and t. t. bitch (Rove—Wenonah).

SNIFTER R. D.—Geo. F. Reed's b., w. and t. bitch (Wanderer—Triumph).

MINNIE—Robt. Hindle, Jr.'s, b., w. and t. bitch (Laick—Sweet Fern).

DIME'S DOLLEY—William Saxby's b., w. and t. bitch (Clyde—Dime).

W. S. CLARK, Sec'y-Treas.

POINTS AND FLUSHES.

Mr. S. C. Bradley, secretary of the E. F. T. C., informs us that in respect to the Subscription Stake the whole of the entry fee was due Oct. 1, instead of 50 per cent., as stated in last week's issue.

Mr. S. C. Bradley, secretary of the E. F. T. Club, has been reëlected to the office of first selectman in his town, which goes to show that the popularity of Mr. Bradley is not confined to field trials men and affairs.

The Metropolitan Kennel Club has decided to hold a show in Brooklyn, N. Y., on Nov. 24, 25, 26 and 27, which will be held under A. K. C. rules and under the management of Mr. Jas. Mortimer.

Wheeling.

Communications for this department are requested. Anything on the bicycle in its relation to the sportsman is particularly desirable.

THE NEW BOY IN AN EMERGENCY.

TOLEDO, O., Oct. 8.—*Editor Forest and Stream:* It used to be said of the Comanches that they spent so much time in the saddle that their leg muscles became gradually enfeebled and shrunken, so that, while they were admirable horsemen, they were of very little account on foot. With the enormous increase of the bicycle a process of a somewhat similar nature, but opposite in kind, is taking place among the palefaces, so that in the course of another generation we shall probably see a race of beings who are all legs and weak in the arms and back. We of adult years have managed to acquire the use of the bicycle after many tribulations, and even now we are never quite certain that some new and unheard of trait of the beast may not develop and find us entirely unprepared to meet it. But the children, Lord bless them! no one can tell when they learned to ride, and in a very little time their adaptability to every motion of the wheel and their perfect ease in its manipulation make even a duck on the water seem like a very clumsy kind of fowl. And it will not be at all surprising if children twenty-five and thirty years from now are born with the instinct of balancing so fully developed that they will take to the wheel without any preliminary training as soon as they are old enough to stand alone.

I did not, however, start out with the intention of philosophizing, but of citing an incident which tends to show whither we are drifting. There are seven souls in the Beebe family (not counting the domestic), all of whom ride the wheel, from the mother of the family down. The youngest Beebe, now in his twelfth year, is the adept of the name, and keeps his father busy when they go out for a breather on the country roads. A few days since the juvenile aforesaid, with some companions of his own age, was climbing about a tree some distance from the family residence, and managed to get a fall which bruised his feet so that he was temporarily unable to stand upon them, much less to walk. Did he set up a wail for his mother, or beg some one to go for a doctor? By no means. As soon as he could sit up comfortably he instructed one of the other boys to go to his house for his bicycle, so that he might ride home upon it.

If the horse is a drug on the market and the four-wheeled vehicle a superfluity in 1896, where will they both be in another decade? JAY BEEBE.

A MORNING SPIN.

NOW that the leaves have begun to fall and the air is full of ozone, a ride through one of our northern parks is particularly delightful. A spin through Central Park, for instance, is an unsurpassed bracer for both mind and body. One inhales the surging air in great, deep-drawn drafts with a keener satisfaction than that with which the old shadow gods on Olympus quaffed their nectar, and each drop of blood in the veins is stirred and set a-coursing as merrily as the water in a mountain stream.

The tardy sun sends its shafts through the trees that now make it blush by comparison with their own gorgeous coloring, and in the road along with the flying wheelman the fallen leaves dance, and race, and tumble over each other in ecstatic hurly-burly.

The spirit of the season is infectious. Everything is hurrying and happy. It is no time to idle now, with the days growing so short. Scampering over the leaves like wind-tossed fragments, or resting momentarily in some friendly eddy, are the gray squirrels, sleek and fat, and full of ginger. The nut crop in the park, as elsewhere, was a poor one this year, and now that the acorns and chestnuts have gone, and that favorite of them all, the hickory, is wanting, the squirrels are driven from the trees to the ground to seek their food. On a two-mile ride through the upper end of the park the other morning twenty-two grays were sighted, most of them out in the open, digging or nosing around in the grass for roots or seeds. These park squirrels present an interesting problem in domestic economy. They inhabit an area of about a square mile, surrounded on all sides by a wilderness of houses and paved streets, and must necessarily get all their food within the limits of their domain. Other squirrels migrate when the supply fails, but we have never heard of the park squirrels following this course, though sometimes they are seen on nearby streets a block or two from their native trees, or for that matter any trees whatever, and it may be that they are then looking about for an avenue of escape.

What then keeps the squirrels from increasing beyond all proportion with the food supply? We are sure we cannot answer. Perhaps they do so increase and die off without attracting attention till a natural balance is restored; but we have never, even in winter, observed the squirrels in poor condition, nor ever heard of a dead one being found.

We are only acquainted with one cause that would tend to restrict the increase, and that is the predatory attacks of cats and dogs—particularly the former—that are frequently to be seen still-hunting in the park. The one thing that ruffles the even tenor of a park squirrel's ways is the approach of one of these prowling marauders, and it is also the only things that makes him bark.

On several occasions we have heard these squirrels cussing away in a temper not at all compatible with their pleasant surroundings, and generally the cause has been some old split-eared and outcast cat.

Man has no terrors for these squirrels, and generally they pay little or no attention to well-conducted dogs who follow the paths.

But, as we said before, there is nothing like a morning ride in the park just now for a bracer. The animal life one sees adds interest to the ride, and by the time you are home for breakfast you are ready to fall to on the meal with an appreciation and zest that no late riser ever experiences. Truly October is the month of months, and cycling the best of sports—when you can't go hunting.

J. B. B.

CHAINLESS BICYCLES.

WHEN it is necessary to locate the seat of the development of power in a bicycle at a point remote from that of its application, much of the success of the design depends upon the means by which the power is transmitted. In the old high bicycle the power acted directly, but, though there were manifest advantages in this method, it was one which did not lend itself to employment in machines in which small wheels were used. Various contrivances have from time to time been experimented with, but all these devices were eventually discarded in favor of the chain. This was at once simple, effective, and easy of application to the machine, whether bicycle or tricycle, and it is now so universally used that it has come to be looked upon as the best communicant of power, so much so that inventors have practically ceased their efforts to discover any superior contrivance. It has been the subject of many improvements, and we have block chains, roller chains, pivot chains, and lever chains. There is no doubt, however, that, while the chain fulfills its office satisfactorily and absorbs but a small fraction of the propulsive force passing through it, there are various objections inherent to this means of transmitting power.

The wear is, of course, much more rapid if the chain be exposed to the dust and dirt accumulated in riding. To guard against this gear cases are used, and in this country are regarded as almost indispensable. In addition to increasing the weight and cost of a bicycle, these shapeless coverings are great disfigurements, and it is only because riders have become accustomed to them that they are tolerated.

As we have said, all the other methods of transmitting power, so far as they were known at the time, were discarded in favor of the chain when, some ten or twelve years ago, the present type of bicycle was adopted. The bevel gear method of communicating power was well known, but, as far as our knowledge goes, was the subject of few experiments, and was either condemned without any fair trial of its merits or was not regarded as being capable of useful adaptation to a bicycle. We remember to have seen at the Stanley show of 1892 a chainless safety, as it was called. This was an application of bevel gearing, but we have not heard or seen anything of the machine since. During the past two years a firm in Paris has been manufacturing a machine known as the chainless safety, and during the present season special attention has been called to this by reason of its having been used with success, both on the road and path, by Rivierre, the noted long-distance French professional rider.

As our readers are aware, we dissent altogether from the deductions it is customarily sought to make from the successes of racing men, as we consider them calculated to mislead and deceive those who require bicycles for other purposes. It is permissible, however, to draw certain conclusions from phenomenal feats, not so much with the object of extolling the merits of a machine as of adducing testimony to show that it cannot possess any serious defect. Rivierre's great ride of 533 miles on the path in twenty-four hours, and his Bordeaux to Paris race, when he practically ran a dead heat with the late A. V. Linton, are incompatible with the employment of inferior appliances, and to that extent we are prepared to admit that an inference may be drawn in favor of the chainless gearing used by him on those occasions.

Bevel gearing is a common means of transmitting power in many kinds of machinery, and its application to the bicycle is clearly shown. A hollow shaft is furnished at each end with a gear wheel, the cogs of which are cut on the bevel. One of these engages the wheel on the pedal shaft, the cogs of which are also cut on the bevel, while the other engages the wheel fixed on the axle of the driving wheel. The speeding up of the mechanism is mainly effected by the disparity in the size between the wheel on the pedal shaft and that in connection with it, but a variation in the sizes of the other wheels causes a slight additional gearing up. The hollow shaft runs upon ball bearings situated under the gear wheels at either end. A means of adjustment is provided, to take up any looseness that may arise from wear. A plentiful supply of a special preparation, having the appearance of crude vaseline, is placed on the wheels, and this acts as a permanent lubricant. The gear presents a particularly neat appearance. This is due to the fact that the stay on the right hand side of the machine passes through the hollow revolving shaft. So perfectly is the idea worked out that many people are at a loss to comprehend how the communication between the pedals and wheels is effected.

We have had the opportunity of trying the chainless gearing on a light machine of French construction. The ingenious simplicity with which it has been applied cannot fail to please the eye, and on this account alone it is sure to prove attractive. There is no emission of oil to soil the dress or attract the dust, and the ease with which it can be cleaned will commend it to many. A couple of weeks' riding has impressed us very favorably with its merits, and as far as that experience permits us to form an opinion we have no reason to regard the chainless gearing as in any respect inferior to the chain. The gear we used was about 70in., and it seemed quite capable of developing any speed required with more than the customary persuasion. We rode up Woodcock Hill, near Barnet, with as much ease as we have ever ascended it on a machine of equal gear; so we do not think it will exhibit any deficiency as a hill-climber. The questions of weight and cost often determined the fate of useful devices, but in the case of the chainless gear we are assured that the machine complete will not cost more than a chain-driven safety of equal quality that is furnished with a gear case.—*London Field.*

Bicycles Baggage in Missouri.

UNDER date of Oct. 12 a press dispatch from St. Louis states that circuit Judge Russell decided to-day that the Missouri Railroad Company must carry J. R. Bettis's bicycle from Webster Grove to St. Louis and return without charge above the cost of Mr. Bettis's transportation ticket. The case was instituted last April as a test. The railway company filed a motion to quash the alternative writ of mandamus secured and Judge Russell overruled the motion. The decision applies to all railways in Missouri.

Yachting.

A FOOLISH report has lately been in circulation through the daily press to the effect that the new triangular course off Newport, just laid off for the New York Y. C. by Lieut. Bull, U. S. N., is intended for future races for the America's Cup. There is no foundation whatever for this report; the course is intended only to supersede the old Sow and Pigs and Block Island courses, neither of which were satisfactory, and the special triangle sailed at times by the New York Y. C. Such a course has long been needed for the regular races of the club off Newport, especially for the Goelet cups. The bearings of the new course are: From Brenton's Reef Lightship ten miles southwest, thence ten miles east-southeast, three-fourths east; thence north by west ten miles, to finish at Lightship.

THE *Yachtsman's* version of the visit of the special committee of the Y. R. A. to Niagara places the whole matter in a very different light from that in which it at first appeared, as reported at the time. It would seem that rumors as to some improper use of the tanks were in general circulation, though it does not appear just how they originated; and that the visit of the committee, arranged in advance, might easily have been timed so as to meet Mr. Gould on board. In this same connection we may mention that at the time when the matter was first reported, early last summer, we wrote to the president of the company which built Niagara, requesting information as to the capacity and location of the two tanks and the size of the connecting pipe. No reply whatever was received to this letter, or to a second, written within the past three weeks to the company, repeating the request. At this late day, after the yacht has been for two seasons in England, her dimensions and construction being of course open to British designers, there can be no reason for withholding these particulars, especially as their publication could only tend to show the absurdity of the action of the Y. R. A. The refusal to furnish them is only in line with that spirit of secrecy and discourtesy by which the builders have done so much to win the ill will not only of the press, but of American yachtsmen.

THE action of the New York Y. C. last week in amending its racing rules is one of the most extraordinary in the history of the club. In the many agitations of the past fifteen years for the improvement of the measurement rules, the position of the New York Y. C. has been conservative to an extreme degree. Its standing as the oldest and largest of the metropolitan clubs has given it a preponderating influence, and this influence has always been thrown against new propositions, however moderate. The adoption of the length and sail area rule in 1883—a mild measure of reform—was only accomplished after much hard work in the face of general opposition, and even then the rule was made to bear as lightly as possible on length. The change of the factors of this same rule some years later was only made after a number of clubs had adopted the "Seawanhaka rule," in which length was taken but once instead of twice. The movement for a classification by racing length in 1889–90 was but a moderate step in advance, infringing no vested interests and promising no startling novelties of the freak species, but in spite of many earnest advocates the New York Y. C. set itself resolutely against the change, and the other clubs, for the sake of uniformity and harmony, abandoned the proposal until the New York Y. C. in its own good time, five years later, was ready to accept it. These are only a few instances out of the many cases in which the club has shown its conservatism, and its disinclination to accept anything new or untried.

The measure lately laid before the club is in no sense moderate, but radical in the extreme; the arbitrary limitation of draft is something that yacht clubs the world over have looked at with reluctance, and coupled with it were certain details that must have a powerful influence over all yachts built under the rule. Whether intentionally or ignorantly, the changes were so framed as to bar entirely the moderate types of yacht in use until the advent of the bulb-fin, and to promote a combination of bulb fin and centerboard, which has nothing to recommend it but speed in racing. The class of yacht which is most severely outlawed by the new rule is one that has always been deservedly popular, one of the distinctive national types of American yachts, the deep centerboard schooner, including such yachts as Lasca, Ariel, Emerald, Sachem, Iroquois, Shamrock, Volunteer, Merlin, Sea Fox, Mayflower, Puritan, Loyal, Dagmar, Quickstep and such older boats as the once famous Montauk, Grayling, Peerless, Idler, Comet, Halcyon, Magic, Columbia and others by the score. As the result of forty years of experiment, a type has been evolved that offers a maximum of advantages, both for general yachting and for racing, on a minimum of draft; and in its way is as nearly a perfect type as has yet been produced in any size or rig, and by any nation. Of course we do not assume that the yachts named actually represent vested interests to-day, or that any injustice has been done to them or their owners individually by the change, but they represent a type whose

value has been long established, and which is capable of still higher development under the modern ideas of form and construction. The proposal to bar this type from racing and to replace it with the fin type, such as Quissetta and Amorita, or possibly something more extreme, is far and away the most radical one that has ever been laid before the New York Y. C.; beside it the measurement and classification by both length and sail were mild and conservative in their day. And yet, where these latter evoked the fiercest opposition and were only passed after successive trials, the proposal to limit the draft, to bar the moderate type, whether keel or centerboard, and to discriminate in favor of the extreme fin-centerboard type, has passed the New York Y. C. without a shadow of opposition.

THE exact results of a new rule can never be predicted short of a season's building under it, at least, and it may be that we are wrong in our surmise of what is likely to come in the present case; but it would seem certain that, looking as he must to speed first, the designer will take the full limit of draft. This same limit is, as in all classes, such a generous one that, having availed himself of it in full, the designer will still have a great length of lever, and will not be compelled, to any material extent, to add to the displacement in order to obtain power. In the smallest schooner class, for instance, such a useful boat as Loyal draws 7ft. 6in. on a waterline of 61ft. and a measurement of 65ft. The draft allowed for a new centerboard yacht of the same measurement is 11ft. The necessity for a minimum of wetted surface is likely to lead to a narrow fin; and it is likely that the lateral plane will be augmented by a centerboard working through the fin, as in Jubilee. It does not follow that the boats will be fin-keels in a structural sense, with a fin that may be detached at will, as in Niagara; but they will be essentially of the fin type, with all of its marked disadvantages.

The matter has gone further in the schooners than in the single-stickers, as none of the latter are really up-to-date. Under the rule Quissetta stands as the ideal of to day, only to be beaten by something equally extreme.

NOT the least surprising thing in connection with the change of rule is the celerity with which it has been made. The same question has engaged the attention of British yachtsmen for at least four years. In 1892 a long and exhaustive inquiry was instituted as to the faults of the existing rating rule and its possible remedy. The services of all the British designers, of the members of the Y. R. A. Council and of yachting experts were enlisted, and much time and labor expended without result, the search for a satisfactory formula being for the time abandoned. Again in 1894 the same lengthy process was gone through with, this time with a positive result; though, as it has proved, an unsatisfactory one.

In marked contrast to this is the action of the New York Y. C. The whole matter was taken up hardly a month ago, at the end of the racing season; in three weeks it was discussed, a satisfactory solution of the knotty question was discovered, a meeting was held, and—Presto—the proposal is a law under which, it is hoped, many thousands of dollars will be expended in the construction of racing boats. The world's record for prompt action made by the club when it adopted the new deed of gift in 1887 still stands unbroken; but a new record has been made in measurement legislation, and the club can no longer be stigmatized as slow, conservative or non-progressive.

THE same limits of draft, extended in like proportion to the smaller classes, have been proposed in the Larchmont Y. C., and will be acted upon at a special meeting on Oct. 28, with other amendments in harmony with those of the New York Y. C. As a matter of course these amendments will be carried in the younger club as they have been in the older. In both clubs, however, there is a serious omission; one important detail that goes hand in hand with the best of the proposed changes being entirely left out. This is the requirement for measurement with crew aboard in all classes. This is done by special agreement in the Defender class in racing for the America's Cup, it is done of necessity in the smaller classes, and it should be done in all classes as the best possible means of checking the evasion of waterline and the freak keel contour. When so many and such radical changes are in hand, we cannot understand why this point has been ignored, as it has been generally discussed by yachtsmen for the past year, and opinion is quite strongly in favor of it.

THE amendment made in the course of the meeting of the New York Y. C. leaves matters in a most undesirable condition, as nearly as we have been able to understand what was evidently a very hurried and faulty piece of legislation. All yachts built after the present date will be limited in draft; but this limit does not apply to existing yachts. This may be interpreted to mean that the owner of an existing yacht has full liberty to rebuild her, adding as much as he pleases to the draft; in fact, making the yacht over entirely into something even more extreme than is possible in a nominally new yacht. This proviso may add materially to the value of existing yachts if made of steel, as this construction can be readily rebuilt in any form without that addition of weight which results with wood construction.

NIAGARA'S TANKS.

THE statement of Sir George Archibald Leach, K.C.B., which we published on Oct. 10, also appears in all of our English exchanges. *The Yachtsman* in its issue of Oct. 8 devotes its leading editorial to the Niagara matter, in particular to this same statement, and places the meeting of the committee and the visit to Niagara in the absence of her owner in a very different light. While we have no means of knowing the exact facts, *The Yachtsman* speaks as though it were certain of its position in making a positive contradiction of the quasi-official statement of a member of the special committee. The editorial is as follows:

Mr. Howard Gould's letter to the council of the Yacht Racing Association has not, of course, been officially answered yet. But Sir George Leach has broken the silence that the *Field* would seem fain to maintain in the meantime by comments which appear in another column. Sir George Leach is reported to have said: "I was on the committee steamer at Tilbury with other members of the council when Mr. Dixon Kemp suggested that, as it was the first time that a sufficient number of members of the sailing committee [*sic*] to form a quorum had come together, it was advisable that a meeting should be held to consider matters awaiting action." Sir George Leach, however, by the above utterance conveys an impression (which no doubt existed in his mind at the time, and may exist still) that it was a purely fortuitous circumstance that the necessary quorum of the council had met on the club steamer on that particularly inauspicious day. It must surprise him, then, to know that a meeting of the council was specially convened for that day, and that the club steamer was the rendezvous—the business being to consider the report on Niagara's tanks. Nay, more, the council meeting was made no secret aboard the club steamer, and whispers went round highly derogatory to the honor of Mr. Gould. Can Sir George Leach honestly blame Mr. Howard Gould for writing his letter to the council in view of these facts and in view of the facts mentioned in that letter? We know enough of Sir George Leach to at once acquit him of any *suppressio veri;* but then, how are we to understand the fact that he was not so well informed in regard to the business of the council of the Y. R. A. on May 22 as many other people—"outsiders"—on board the R. T. Y. C. club steamer, who, as the event proved, derived their information from authentic sources? Are we to suppose that Sir George was purposely kept in the dark as to the convention of the council on that day? If so, we feel sure that he will require to know the reason of such a curious procedure. One can hardly doubt, after reading his reply to Mr. Gould's letter, that Sir George Leach was one of the councillors who boarded Niagara for the purpose of examining the tanks. Yet he must have come away with somewhat hazy ideas as to their nature and dimensions, if we are to believe the interviewer to whom he has delivered his soul on this subject. "They are 4ft. long, about 1ft. wide at the top and 1ft. deep, doubtless sloping at the bottom." Yet each of them, in Sir George's opinion, is capable of containing 7cwt. of water. The word "doubtless" is specially significant when used by one who may fairly be expected to state nothing but what he knows to be absolutely accurate. Was Mr. Manning another of the visiting triumvirate and "a leading member of the Yacht Racing Association," the third?

There is another view which the patriotic portion of the British press has not yet taken of Mr. Gould's letter, viz., that he is certainly justified in saying that he was entitled to some explanation of the conduct of the council. Here we may mention for the benefit of the *Daily Graphic* and other daily papers that on May 22 the club steamer arrived at Gravesend Pier just abreast of the first-class yachts. Niagara did not finish until twenty-four minutes later. A considerable time then elapsed before Niagara could take up her berth in Tilbury Dock, and after she had done so, and Mr. Gould had had time to prepare for his journey to London, another thirty minutes were allowed to elapse before the special investigating committee thought fit to board the yacht. One would think that the object before the committee would have been more thoroughly achieved had they boarded her just after she had crossed the finishing line. They had twenty-four minutes to prepare for such a maneuver (which would have avoided much unpleasantness). Did "tea and shrimps" prove more attractive than Mr. Gould's society?

Now with regard to the duty of official measurers. We all know that anything suspicious must be reported by them to the secretary of the Y. R. A. But the word "suspicious" does not embrace everything that even an official measurer finds to be new or unusual. Surely in order that a man should be worthy of such an appointment it is essential that he must (1) be possessed of an ordinary knowledge of yacht racing; (2) be prepared to use extraordinary care in the examination of anything new or unusual which he may see on any yacht before reporting the same to the council; and (3) being debarred by the rules from measuring yachts designed or built by himself, he should be more than usually careful in his examination and measurement of any vessels which are to race against his own creations before reporting anything suspicious. It would be absurd to say that Mr. Payne is not sufficiently skilled to see at a glance that the connecting pipe of Niagara's two tanks was absolutely useless for the purpose of shifting ballast, for that must have been patent to everyone who saw the arrangement (and this seems to have been grudgingly admitted by the special committee of investigation). We should be glad to known in what way Mr. Payne considered these tanks worthy of suspicion, and therefore of report. But it is quite unfair, as our remarks above amply show, to fasten the whole blame of this incident on Mr. Payne—he is really the scapegoat of more blameworthy persons.

In the face of the above detailed statement it would seem that an explanation is in order from Sir George Leach, if the facts are as represented by *The Yachtsman*. Sir George Leach's ignorance of the current business of a body with which he was most closely connected is even more extensive than his ignorance of such simple technical matters as the weight of water and the construction of tanks in the bilge of such a boat as Niagara. Up to the time of writing the *Field* has refrained from commenting on Mr. Gould's letter, but as the meeting of the council is now over the matter will doubtless be discussed at length by it.

In its issue of Oct. 15 the *Yachtsman* continues the subject as follows:

At the peril of being considered by the *Daily Graphic* as being without the pale of "reasonable men," we venture to once more correct that journal which, we must in fairness say, has all through last season supplied its readers with thoroughly good, if brief, reports of the chief yacht racing events day by day. The *D. G.* has seemed of late, however, to hold a brief for the Y. R. A. Council, and its well-known pluck has seldom been so conspicuous as now, when it defends the Council in the case of Niagara's water tanks. The following is one of its leading articles in the issue of 13th inst.:

It is naturally much harder to kill a phantom grievance than a real one, and we can hardly hope that the spirit of discord, which escaped from the Niagara's tanks in "London River" last May, and has since spread itself across the Atlantic, will be completely and finally laid by the letter which the Council of the Yacht Racing Association yesterday addressed to Mr. Howard Gould. The letter should, however, set at rest in the minds of all reasonable men in this country any lingering doubts as to the straightforwardness and courtesy of the manner in which the Council acted upon the report of their official measurer. The *Yachtsman*, never very friendly disposed to the Y. R. A., recalls this week "for the benefit of the *Daily Graphic*" the fact that the committee appointed to investigate the question did not board the Niagara for an hour or so after she had crossed the finishing line, and seems to suggest that they purposely waited until Mr. Gould had had time to leave his vessel. We do not doubt the word of Sir George Leach that the committee boarded the yacht at the earliest possible moment, and in view of what has since happened, we regard it as a matter for congratulation that that moment did not arrive until Mr. Gould had left for London. If the committee had gone on board the instant the Niagara crossed the line, Mr. Gould might conceivably have had some reason to regard their haste as implying strong doubt of his honesty, and as an attempt to catch him, so to speak, *in flagrante delicto*. As it is, his complaint was unreasonable, and—after the exceptional favor granted to him last year—ungracious. The fact is that a good many American yachtsmen have yet to learn that if they race over here they must submit to the same conditions as the princes, peers and commoners of Europe.

Our leading article last week did not (nor was it intended to) convey any doubt as to the veracity of Sir George Leach. It stated plain facts which cannot be denied by any member of the Y. R. A. Council. But we fail to see how, after reading it, the editor of the *Daily Graphic* can still think that the committee boarded the yacht "at the earliest possible moment." We deny most emphatically that the earliest opportunity was seized, and last week we showed clearly that such was not the case. It was common talk under the guise of secrecy, aboard the club steamer *before* the meeting of the Council, that Niagara was to be boarded immediately on the conclusion of her race, in order, as one councillor remarked at the time, that there should be no repetition of "the Defender business." That was the object in view at the time. Why then was so much valuable time wasted by this dutiful triumvirate?

What the "exceptional favor" was that "was granted" to Mr. Howard Gould last year we do not know. Probably the *Graphic* refers to the Vigilant's visit the year before last. If so, we may point out that Mr. George Gould is the owner of the Vigilant. It is hardly to the credit of the Council that the best defense for its conduct in the matter of Niagara's tanks is that it failed in its duty two years ago! The Dunraven pamphlet was not published at that time, to be sure, and the Earl was not then a vice-president of the Y. R. A.—merely a candidate for the America Cup.

The *Field* of Oct. 17 has very little to say:

We published on June 6 last Mr. Howard Gould's statement of his opinion of the action of the committee of the Y. R. A. in inspecting the water tanks of his yacht Niagara. His letter to the press a fortnight ago threw no fresh light on the matter and omitted altogether to state that the subject of the tanks had been common gossip, both in 1895 and this year. It now appears from the letter the Council of the Y. R. A. has addressed to Mr. Gould through his adopted channel of the press, that the official measurer made a special visit to the yacht to inspect the tanks, and reported the result of his visit to the Council. This visit must have, in the ordinary course of events, come to the knowledge of Mr. Howard Gould, as it suggested there was a possibility of the tanks being used for the purpose of shifting water ballast. The Y. R. A. committee did not, however, act hastily on the report, but determined to inspect the tanks themselves. This they did on May 22, and according to Mr. Howard Gould's published statement the committee expressly stated that in their opinion the tanks had not been used for the purpose of shifting water ballast. The committee suggested that the tanks should be disconnected, so as to remove all cause of suspicion as to their use. Mr. Howard Gould consented to do this, and, in fact, wrote to the Council stating that the tanks had been disconnected at Southampton. It should be mentioned that the late Baron von Zedtlitz, when he heard of the objection to the water tanks under the sofas, immediately had his removed from the Isolde, not being content with a simple disconnection.

Massachusetts Y. R. A.

A MEETING of the Massachusetts Y. R. A. was held on Oct. 15, at which some very important changes were made in the rules, as follows:

The measurement for classification and time allowance shall be a yacht's length on the waterline.

The waterline length shall be taken from point of immersion forward to point of immersion aft. In cases where any portion of the rudder or rudder post projects above the water such portion shall not be included in the waterline length.

The waterline shall be determined by putting the boat in proper trim in still water, as directed by the measurer, with the maximum weights of crew and ballast which the owner may elect to carry in any race. The weight of crew shall be averaged at 150lbs. per man, and placed amidship at the point of the greatest beam on waterline, or in such position as to put the yacht in proper trim.

All racing spars, sails, rigging and racing truck, and at least one anchor and cable, and such other articles as are needed for ordinary sailing, shall be on board and placed where they are usually stowed when not in actual use, and centerboard up.

Existing yachts may race in their 1895–96 classes, if forced above the limit of their classes by this rule of measurement, provided they were properly in their former classes.

After season of 1897 the measurement of all existing yachts shall be assumed to be the maximum limit of their classes.

So far as the waterline is concerned these changes are all beneficial; the former plan of measuring 3in. above the actual waterline is abandoned, and in place of it the waterline itself is measured, and that with the crew aboard; no attempt being made to tax overhangs. All this is in the right direction, but we cannot say as much for the selection of waterline alone as the sole factor in both measurement and classification; the experiment of unlimited sail has been tried too often in the past, with the uniform result of the production of a bad type, to warrant any further trials. It may be that local conditions as they exist to-day about Boston will prove a sufficient limit to the abuse of power. With a large number of races at different points about Massachusetts Bay, there is certain to be encountered more or less hard weather both in the races and in the necessary passages across the bay that will favor the moderate boat; but we look to see the development of a type that fortunately is about extinct in New York, and is rapidly dying in the West. The change of measurement calls for a new classification, which will probably be made at a future meeting. The Association has fared well during the year, receiving general and well-deserved support from all the clubs about Boston.

TRIAL TRIP OF THE DORY.

This shall be the true history of the trial trip of the dory. She was a home-made dory, begun upon what the builder alleged to be the correct lines, but altered therefrom from time to time to oblige some interested friends. As completed she was rather a pretty boat, 18ft. over all, 4ft. 6in. wide from rail to rail amidships and 2ft. 8in. wide on the bottom, sharp at both ends, with an overhang, bow and stern, of 19in. Then she was decked over fore and aft, and taken altogether she looked like a very serviceable craft. K. built her. He told me some enormous stories about how staunch dories were in wind and sea, which I had to believe or laugh at; and as he was rather larger than I, and of a somewhat warm temper, I of course believed the aforesaid stories. I sometimes helped him in his work on the dory, and the Saturday we completed her he invited me to take a little run up the lake over Sunday. In an evil moment I consented and departed to get my luggage.

When I returned, about two hours later, the dory was in the water and equipped with a tall mast and a very large sail. I objected to that sail from the start, and told K. that it was too large, but had to defer to his overwhelming wisdom; he knew all about dories, and I didn't know port from gun'l. Consequently if I get names and things a little mixed in this narrative I trust that my readers will pardon my ignorance; it is really because I don't know any better.

Having deposited our luggage in the bow we—that is, K. —shoved out into the river, eased off the sheet, and we proceeded on our eventful voyage. No sooner had the sail filled than I began to feel uncomfortable and changed my position a trifle. Instantly the boat careened, and but for a lively maneuver on my part we had suffered shipwreck then and there. I at once received a long lesson, admirably expressed, upon the art of sitting in a dory, at the end of which we had rounded the Oswego light and bore away for Fair Haven, fifteen miles up the lake.

Off to the west a heavy bank of clouds obscured the horizon, and out of it came occasional flashes of lightning and muttered peals of thunder. The wind, which was zephyr-like on the river, began to come by strong puffs from the southeast, and at every puff I had to shuffle to windward to keep the dory from capsizing; so soon as the puff eased, however, I had to move again or dump her the other way. I asked K. if that was what he meant when he talked about "shifting ballast," but he only frowned darkly and I subsided. Before we had gone two miles I was lame and weary, but under the masterful seamanship of K. we kept afloat and sailed on.

Sailed? We fairly sung through the water; in one respect, at least, K. had not overdone the merits of that little skimming-dish, for she went like a witch. Indeed, under the powerful influence of that big sail and the big wind, she had to go on like a demon or go down. The trouble I had predicted from that great spread of canvas soon materialized; in spite of the alacrity of the "shifting ballast," K. had to keep luffing her. Thus we lost time, and were over three hours in arriving off Fair Haven Harbor light. We made ready to come about for the run in. Then we made another discovery, and this time a startling one: the dory, so utterly different from most of her sex, refused to go in stays! We tried it a dozen times, and each time she would shove her nose within a point or two of the wind and then fall off and go tearing away up the lake. The wind had at this time hauled to the south, as though to get a better slant at us. Seeing that we could never make the harbor at that rate, I took command of my end of the boat for a moment, and the next that big sail lay flapping in the dory. K. was mad; but feeling comparatively safe, for the big fellow dared not move about much, I rejoined with full vocabulary. I found the oars, shipped them and straightened her up for the harbor.

Now, Fair Haven Harbor is a natural bay running inland about three miles; the piers extend out from the shore due north for 1,800ft. I shall never forget that pull as long as I remember anything. The wind swept down the bay, carrying a big sea before it, and it fairly screamed out between those straight, long, high piers, which are only 200ft. apart. I laid on blisters thick and fast; but it was a struggle for shore, with a disagreeable alternative, and I stuck to it. The wind howled in my ears: "No you don't, no you don't," but inch by inch I did it. I must have been a good hour pulling that 1800ft.; it seemed like ten.

As I passed the inner or shore light, I called to K. to get ready to take the oars. Before he could do so, however, we struck upon one of those abominable little shoals which infest Fair Haven Harbor, and for the second time that night we nearly came to a conclusion. Things looked squally. K. made some exasperating comments upon my skill as a pilot, which only lack of breath prevented my replying to with vigor. The sea in that contemptible little bay was really wicked, and before we got off into deep water again we had shipped a goodly cargo of big rollers. At last K. got into shape to do some rowing, and I lay down in the stern a good deal the worse for wear. I hadn't seen much fun in it yet. I soon revived, however, to witness the magnificent struggle K. was making against wind and wave. A weaker man never could have done it, but in an hour and a half he had us in easy water near the head of the bay, and at just midnight we landed to get supper and sleep.

We carried the mast and sail to a sheltered nook and improvised a tent, under which we put our baggage. Stones for a fireplace and wood for a fire were plentiful, and in a short time we had stowed away a generous lunch, washed down with a cup of hot coffee. The full moon had smiled upon us for some time, and by her kindly light we spread our blankets under the little tent and composed ourselves to sleep. About 2 o'clock I was awakened by a tremendous peal of thunder and found it was raining in torrents. Never have I seen the lightning so vivid and seldom heard such stunning concussions of thunder as greeted my senses that night. A number of severe storms seemed to have centered in that vicinity and the uproar was fearful. I suppose it must all have been very sublime, but as nothing will stampede me quicker than a good healthy flash of lightning, I didn't appreciate it. This time I couldn't stampede; it was a plain case of lie and take it. I did, but trembled like an aspen leaf, expecting every moment to be my last. The only thing necessary to complete my discomfort would have been a stream of water running down under the tent; but we had unwittingly pitched our camp on just the spot to afford good drainage, and the new canvas protected us perfectly from the rain. We didn't take a drop—of rain.

For two hours the storm raged with incessant violence. At every flash I could see a puzzling, dazzling blue fire close to my feet, and finally I called K.'s attention to it. He said, "Why, there's a piece of barbed wire from the fence lying there." How I enjoyed myself then!

Sunday morning broke clear and cold, with the wind from the west and blowing half a gale. We spent the day until 3 o'clock eating our limited supply of provender and tramping about to keep warm. At that hour the wind lulled a trifle and we packed up, loaded our duffle into the dory, and started down the harbor toward the piers to see what the prospects were for getting home that night. We found them very poor.

Now, there is a large bay just east of Fair Haven Harbor, separated from the lake by a narrow sand bar. Stirling Creek flows into this bay, and a small opening in the beach admits the passage of boats having considerable draft to and from the lake. This opening is in the lee of the piers, and is only a short distance from the harbor. By hauling the dory across a narrow strip of beach between the piers and the mainland into the lake we could get up into the smaller bay, and this we did without having to go out through the piers. It is a pretty spot about there, plenty of woods and still water inviting many sportsmen every year to visit the place. We landed on the east shore of the bay and at once discovered a party camping in the woods. Our personal appearance was by this time somewhat against us, but neither of us were beauties anyhow, and we finally ventured to call on the campers. I found them old friends of mine, and that was the first bit of good luck we had thus far had. We paid for it dearly before night.

At about 4:30 K. suggested that we rig the sail on the dory again and venture out into the still water to try and discover, if possible, why the confounded boat wouldn't go in stays. We did so. Our first reach was a long leg out by the opening in the bar, and just as we got abreast of it K., by some inspiration of fool judgment, suddenly straightened her for that opening. In five seconds we were through it, in five seconds more we were running like lightning before the wind for Oswego, and in five more we were both scared half to death. I don't even yet believe that K. had the remotest idea of trying the run home until just an instant before he ran her out into the lake. The sea was very heavy and the wind had begun to freshen again. Had I only known what he would do, one minute before he did it, he would have gone it alone. But in sixty seconds after we had passed the bar all the horses in York State could not have pulled us back into Stirling Bay again. That is just it: one never realizes the full meaning of a step until he has taken it. We were, as I have stated, running free.

The tiny little dory fairly flew through the water, for all that the enormous pressure of her big sail almost buried her in the waves. The further we went the further we passed from the friendly lee of the piers, and the sea, as we both saw, must soon prove too much for her. She steered wildly too, and even all K.'s great strength was hardly equal to the task of keeping her on her course. All at once the long boom struck the top of a particularly big wave. The next instant something gave way overhead, there was a general mix-up of ropes and canvas, and then a great crested roller over-topped the dory and fairly swamped her. The next thing I knew I was slashing those ropes with my pocket-knife, and in a little less than no time the sail was down and the ropes cleared.

Grabbing the oars, I headed for shore without waiting to select a suitable spot to land. K. bailed for dear life. We were half a mile out, but this time I had wind and sea with me and we were soon close in. Then we saw a sight which made our hair stand straight up. Breakers were rolling in on the shore, big enough to kill us if we happened to be thrown on the rocks. Nothing for it though; in we went, and the first breaker wrenched the oars from my grasp without half trying and cast us broadside to the sea. The second came toppling clean over us. I had to laugh, even at that serious moment, to see how imploringly K. threw his hand back, as though to push off that great wall of green water which hung for one-half second right over our heads, and the next buried us out of sight. The third breaker threw us up, with a sickening bang, upon the beach. There was some pretty tall scrambling done then; by efforts which taxed our combined strength to the utmost, we succeeded in getting the boat out of water; sorry the day she ever went into it! Our blankets were soaking wet, our food all ruined and unfit to use, while K. and I were sopping.

A large piece of woods about a quarter of a mile down the beach offered us some shelter from the driving wind, and to it we plodded over the stones, pretty well discouraged. The catastrophe meant a night, at least, on shore with no grub. Fortunately our matches were dry, and selecting a spot in the woods which had evidently been used as a camping ground before, we soon had a rousing fire going. Three long and weary trips to and from the boat for our baggage followed; the sail was again utilized for a tent, and stripping off our wet clothes, we hung them around the fire to dry out. Ugh, but that was a chilly evening!

About 7:30 we heard somebody driving a cart through the woods a little below us, and shortly a small boy put in an appearance. He said that he had seen us go ashore, and with his mother had driven down to learn what they could do for us, if anything. After a few minutes' talk the lad called for his mother. Being *en deshabille*, I sloped into a thicket and waited, shivering. K. seized a wet blanket, wrapped himself in its folds and stood his ground. He soon made an arrangement for something to eat and at 9 o'clock two boys brought us a big basketful of supper. Oh! but it was a delicious feast, everything being steaming hot, and plenty of it. We handed back nothing but empty dishes. The lads then urged us strongly to go to the house and spend the night. We reflected, but finally decided to stay by our camp.

As our visitors rose to leave us one said, "Well, I hope the bull won't bother you."

"Bull!" exclaimed I, "what bull?"

"Well, we have got a bad bull here in the woods, and the last time a party camped here he attacked their tent and drove the boys up a tree."

That was news of an important character.

"But," he added, "maybe he won't disturb you; if he does, knock him down with a stone." When the boys had gone I said to K., "That bull racket was only a scare to get us to go to the house; I am short of money, and it would probably cost us all we have in case we are compelled to stay there two or three days." K. agreed with me. As precaution, however, we stretched a rope around one side of the tent and barricaded the other side with rails. We also laid some clubs and stones handy, and I loaded my revolver and small rifle, and we concluded that if any bull put in an appearance we could make it interesting for him. Then we turned in and went to sleep, thoroughly tired out.

At 2:30 the full moon had sailed over into the west, and shining through the open tent into our faces woke us up. In a few moments I heard a sound that I recognized. It was a deep-toned roar which filled the woods. I dove out through the tent, crying to K., "Get out of that; that d— bull is here."

K. hadn't heard it, and thought that I was only nervous. "*B-o-o-o-o!*" again sounded through the recesses of the woods.

"Don't you hear that?" I demanded. No, he did'nt hear it; the breakers were booming on the beach, and that immense roar of our bovine friend so nearly resembled the noise that K.'s unpracticed ear couldn't detect the difference.

Now K. knows a lot about dories that I don't; but when it comes to bulls I am away ahead; I had been ahead of bulls on several occasions, and not any too far ahead either. It was the curious "boo" of a surly bull that had startled me, and no mistake. I got K. out of the tent. Again the deep roar. K. became convinced. We armed ourselves with clubs and stones, and I laid the revolver where I could get it quick. The woods were dark in spite of the fact that the moon was full and the sky unclouded; but I knew that the critter was coming head on, and coming fast. I also knew from the volume of sound that he emitted that he was a big one. I told K. that as long as the bull only "booed" we were all right; but that if he bellowed out it showed anger, and in that case I was going to take no chances, but should make for the bluff and go right over it regardless. K. said he should not stay to face him alone, and should go along with me. I applauded his discretion. We yelled at the bull and fired the gun and pistol in his direction, but he only stopped for an instant, and then came on again; we couldn't see him, but we heard him. At the critical moment, just as my courage had all run out at my toes, K. got another inspiration: he whistled, and cried to some imaginary dog, "Sick him!" That did the business; we heard a tremendous stamping and snorting, and then old Boo Hoo trotted away.

We didn't sleep any more that night, and at 4:30 o'clock, the wind having subsided, we broke camp for home. This time that mighty sail was rolled up and snugly stowed away, and K. seated himself at the oars. We had not beeen afloat ten minutes when the wind again sprang up, the sea commenced its old monotonous boom upon the distant beach, the dory began to pitch and toss, making rowing almost impossible, and in a few minutes we decided to go ashore again. The same circus was gone through in getting to land that had amused us on the previous evening; we got wet, and so did everything in the boat. We began to grow anxious. At this rate it would take about ten days to return to Oswego, and our families would worry. We began to think about breakfast, and seeing a house far up in the country concluded to go and ask for something to eat. K. knocked at the door and dodged around the corner of the house; he was always supersensitive on the grub question. A young farmer opened the door and inquired what he could do for me. I told him, and we were invited in to breakfast. The moment K. showed himself he was welcomed with open arms; he was well acquainted with the family, and we were warmly entertained. All that day we hung about the house waiting for the wind to change; it didn't. But the next morning was perfect, and bidding good-by to our friends, we got under way for home.

This time we fetched it. It was only a little row of twelve miles, but the way we made that dory spin was creditable. We reached the landing from which we had departed so full of vigor somewhat crestfallen. Friends helped us to get the boat out of water, and then K. seated himself alongside of her and propounded the query, "Well, what do you think of her?"

I replied, "If what you told me about the performances of dories was all true, then this craft is not a dory." K. got hot right off. "She is a dory," he snapped out.

The next time I saw the boat he had painted a name on her stern, Isadoré.

But I don't believe it even yet. D. F. H.

Oswego, N. Y.

The British Y. R. A.

A meeting of the council of the Yacht Racing Association was held at the Langham Hotel, Oct. 12. There were present Sir G. C. Lampson (in the chair), Major Percy Hewitt, Baron von Knoop, Mr. W. B. Paget, Mr. Herbert Crossley, Mr. W. Baden Powell, the Hon. G. C. Colville, Mr. Peter Donaldson, Mr. T. B. C. West, Mr. Fred Cox, Mr. G. E. Lake, Mr. A. Manning, Mr. R. E. Froude, Mr. Frank B. Jameson, Col. Villiers Bagot, Mr. Philip Perceval, Mr. C. Newton-Robinson, Mr. W. G. Jameson, Col. Fitzroy Clayton and Mr. G. B. Thompson.

The meeting was mainly held to consider suggested alterations to the rating rule. After a very long discussion the council decided to recommend that the rule remain as it is for the classes above 36ft. rating, and that for ratings of 36ft. and under it be altered in accordance with a suggestion of the yacht designers to length plus 1.2 beam plus whole girth plus half square root of sail area, a suitable constant divisor to be chosen, and readjustment of the classes of 36ft. and under to be left to the rating rule committee, who will meet forthwith.

$$L. + 1.2\,B. + \text{Girth} + 0.5\,\sqrt{\text{Sail area}}.$$

It was decided to recommend that centerboards should in future be measured as fixed keels, and that the time allowances from 90ft. rating upward be increased 10 per cent. for every foot of linear rating. Also that the lowest rating for first-class yachts be 79ft.

Some correspondence was read from Mr. Howard Gould relating to the action of the council with regard to the water tanks of his yacht Niagara. The secretary was directed to reply as follows:

"Your letter of Sept. 28 is hereby acknowledged. I am to reply that the visit of the committee to the Niagara was made in the usual course solely in consequence of the official measurer having in May last, in the execution of his duty, reported to the council that her water tanks were connected in such a manner that they might be used for shifting ballast. Notice of the visit was not given, as the committee expected to find you on board, but hearing from your captain that you had left for London only a few minutes previously they requested permission to inspect the tanks, which permission was readily given. The observation of the committee confirmed the report of the measurer, and they recommended to you in writing that the tanks should be disconnected, at the same time expressly disclaiming any imputation that the tanks had actually been put to an improper use. The council fail to perceive that any discourtesy was displayed toward you; certainly none was intended. It is not considered necessary to enter into a discussion of other points raised in your letter, but as you have thought fit to make your grievance public, this reply will pass through the same channel."

The council next considered a protest referred by the Castle Y. C. relating to the entry of Audrey in a race in August. The club disqualified Audrey, and the council now upheld the decision, so Niagara will get the prize.

The Royal Albert Y. C. addressed a letter to the council, stating they did not intend to refer the case of the Meteor-Isolde collision for adjudication.—*The Field.*

In the storm of Oct. 11 the small yacht Elsa, with her owners, George Leonard and Frank Freeman, was anchored off Squantum, Mass. The tender broke away and the men could not reach the shore, and they ran short of food. They were found by friends on Monday night, Oct. 12, both lying on the floor of the yacht and completely exhausted.

Mon Reve, schr., formerly the sloop Thetis, has been sold by E. P. Baugh, Jr., to Dr. Chamberlain, of Boston.

The Isolde Disaster.

MR. RICHARD G. ALLEN, the representative of the Emperor of Germany on the cutter Meteor II., writes to the *Field* as follows concerning the unfortunate collision between Meteor and Isolde. Mr. Allen's side of the case is quite different from that presented by the testimony of other witnesses, as he declares that Meteor had a positive overlap on Britannia, and could not have passed to leeward; and also that there was room for Meteor between Britannia and Isolde, had not the latter been thrown from her course by Saint.

Editor Field:

On the day of the unfortunate collision been Isolde and Meteor I was on board the latter as the owner's representative. Till now I have refrained from making any statement on the subject, being informed, on what I considered good authority, that an inquiry into the whole matter would be held by the R. A. Y. C. or the Y. R. A. It appears, however, from last week's *Field* that no such inquiry is to be made.

Although the coroner at the inquest quite exonerated Meteor, the tone of the articles in the *Field* has been, whether intentionally or not, adverse to her. I therefore desire to state the facts as I know them. The collision took place at the commencement of the second round, shortly after rounding the committee boat, which was anchored off the Spit Fort. Britannia, Meteor, Isolde and Saint all approached the committee boat on a broad reach, the wind being on their starboard quarters. Meteor was then a little to windward of Britannia, and was overhauling her steadily. Before rounding the committee boat Meteor had established an overlap, her bowsprit being well up on Britannia's counter. This being so, Britannia was bound to give Meteor room, and she did so.

The official timing of the yachts on passing the committee boat proves that the overlap had been established. This timing shows that Britannia rounded the committee boat at 12h. 7m. 26s., and Meteor at 12h. 7m. 30s., a difference of only four seconds. At that time I do not think that Britannia was going as fast as ten knots an hour, but supposing she was, in four seconds she would only go about 6ft. Over all Britannia is about 160ft. long, so that although she may have been going a little faster than ten knots, it would still leave an ample overlap to Meteor. Having established an overlap, Meteor was perfectly entitled to go to windward of Britannia; in fact, she could not have gone to leeward had she so desired.

On approaching the committee boat Isolde and Saint were both ahead of Meteor, a little to windward, Isolde leading, but Meteor was catching them fast. Meteor ran up alongside Saint to leeward of her and rounded the committee boat outside of her. The official timing gives the same time for Meteor and Saint, 12h., 30m. 7s. We gave Saint plenty of room, and she rounded to windward of us, that is, between us and the committee boat. On rounding, Britannia luffed to windward of her course, which compelled Meteor to set a course parallel to that of Saint and Isolde, but there was ample room between Meteor and Saint.

Had Saint and Isolde only held their courses there would have been no collision. Meteor had a clear passage to leeward of Saint, and as Isolde was to windward of her there would have been still more room to pass Isolde. Saint, however, now luffed. It has been stated in a letter to the *Field* that this was done in order to get clear of Meteor. It is impossible that Saint could have been in any danger from Meteor, as the latter was alongside Saint before she commenced to luff. We took it for granted that she was luffing simply to get to windward of Isolde.

In luffing Saint's topmast stay caught the lee side of Isolde's boom. Isolde's bow at once began to fall off to leeward, that is, toward Meteor's course, and after Saint cleared the boom of the Isolde the latter continued to bear away right across Meteor's bow. The Meteor's bowsprit went through her mainsail from to leeward, and her bobstay cut Isolde's rail, about 8ft. from the end of her counter. This swung Isolde round and her bowsprit and about a foot of her stem were knocked away against Britannia's side.

Very little time elapsed between Isolde first altering her course and Meteor's bowsprit going through her mainsail. Meteor could not possibly have luffed round her stern, for there never was room to do so. On the other hand, had Meteor borne away she would have hit Isolde amidships and jammed her against Britannia, but in any case there was no time to alter Meteor's course.

It is no business of mine to lay the blame on anyone in particular; all I am interested in is to remove the impression, which may have been produced by your articles, that the collision was due to any fault on the part of Capt. Gomes, of the Meteor.

RICHARD G. ALLEN.

25 BOTHWELL STREET, Glasgow.

This letter has brought out the following replies in the *Field* of Oct. 17:

Editor the Field: As the letter of Mr. Allan in your last week's issue is calculated to produce an entirely erroneous impression on the public mind regarding the lamentable collision to which he refers, I feel it my duty, and a simple act of justice to the captain and crew of Britannia, to indicate how very far from accurate is Mr. Allan's description of the occurrence.

I also had refrained from alluding to this matter before in the same hope that Mr. Allan had expressed, that the Y. R. A. would institute a full and searching inquiry into the causes of the disaster; but as the council have not thought fit to undertake such an investigation, I must ask you to permit me the use of your columns to expose the inaccuracy of Mr. Allan's statements, and to enable disinterested persons to form a just opinion as to which vessel was responsible for the melancholy incident.

On the truth of Mr. Allan's statement, that "before rounding the committee boat Meteor had established an overlap," his whole case depends, and when this statement is proved to be utterly untrue, as it is conclusively proved to be by the most incontrovertible evidence, namely, an instantaneous photograph and the observation of onlookers, the attempt of Mr. Allan to exonerate Meteor entirely fails. The photo to which I refer was taken some distance after the two vessels had rounded the committee boat, and clearly shows that even then no overlap had taken place, neither was "the bowsprit of Meteor well up on the counter of Britannia."

That an overlap had been established at the time of the collision is, of course, indisputable, but Meteor was certainly most ill-advised in thus attempting to force a passage to windward of Britannia. The result of this reckless maneuver was almost inevitable, having regard to the position of the two twenties at the time.

I most distinctly assert that in my opinion, and in that of others well qualified to form an opinion, Meteor was solely responsible for the deplorable disaster.

In conclusion I may say, however, that I would not have made this statement had not Mr. Allan seen fit to make a direct and unjustifiable attack on the captain and crew of another vessel while endeavoring to shield the boat on which he was sailing from the blame which rightly attached to it.

WM. G. JAMESON.

Editor the Field:

Mr. Allan in his letter to the *Field* last week makes some assertions about the position of Meteor when rounding the flagboat just before the accident occurred on Aug. 18 last, and tries to prove them by deductions taken from the timing of the yachts round the flagboat.

This timing, I maintain, was inaccurate, as by it Meteor and Saint passed the mark at the same second. That this was not the case is clearly shown in the photograph published in the *Field* some weeks back, which was taken after the flagboat was passed, and after the foul had taken place between Saint and Isolde, and this photo shows Meteor still to be distinctly behind Saint, which position would have been impossible if they had rounded together, Meteor being so much the faster boat.

This, I think, is sufficient proof that the timing was inaccurate, and Mr. Allan's deductions therefrom are consequently worthless.

F. B. JAMESON.

New York Y. C.

THE regular meeting of the New York Y. C. was held on Oct. 22, with Com. Brown in the chair. The following nominating committee for the annual election was elected: C. Oliver Iselin, George L. Rives, Seymour L. Husted, Jr., Henry F. Lippitt, Frederick G. Bourne, Edward E. Chase, John G. Beresford, Chester C. Griswold, William Butler Duncan, Jr., and Oswald Sanderson.

The proposed changes of the by-laws and racing rules, as published last week, were passed with an amendment providing that in the 60ft. single-stick class a 10ft. boat should be carried, and another amendment as follows: The maximum draft of any yacht when in racing trim shall not exceed that specified for her class in the following table, exclusive of centerboard; but this limit shall not apply to any yacht in existence at the time of the passage of these amendments when racing in the class in which she was classified prior to this time.

A letter was read from C. Oliver Iselin thanking the club for the cup presented to the Defender syndicate, which has been presented by W. K. Vanderbilt and E. D. Morgan, the other members of the syndicate, to Mr. Iselin. The following new members were elected: Lieut. Louis J. Magill, U. S. Marine Corps; John McClintock; Dr. Joseph A. Guthrie, U. S. N.; Emile L. Boas, Frederick Lothrop Ames, Charles Lane Poor, J. M. Hartshorne; Past Assistant Paymaster G. W. Simpson, U. S. N.; Commander F. W. Dickens, U. S. N.; Lieut. O. W. Lowry, U. S. N.; Harry B. Tolley; Pay Director L. G. Billings, U. S. N.; Francis M. Scott, John T. Williams. The amendment to increase the dues from $25 to $35 was lost.

Miramichi Y. C.

MIRAMICHI RIVER—CHATHAM, N. B.

Monday, Oct. 12.

AVIS, Oriana and Learig sailed a twelve-mile race off Chatham on Oct. 12 for sweepstakes. Half the race was windward work. Thomas Currie's Learig led all the way, followed by J. L. Stewart's Oriana, and covered the course in 2h. 24m 25s., Oriana finishing 4m. 27s. later. Learig was awarded the race by 27s., corrected time. Oriana broke her spinaker boom and could not carry that sail in the last leg, a run of 1½ miles.

The club sailed five races during the season. On July 1, with two reefs tied down, Oriana won the Stewart pennant against Maude and the larger Learig on elapsed time. On July 23, in the race for the Governor's cup, Oriana was dismasted and Learig was an easy winner. The new yacht Avis, a skimmer, was capsized. On Aug. 27 Oriana won the Adams cup for the second time, by 30s., corrected time. On Sept. 24, for the Walt cup, Oriana was run into while rounding the last mark, and put out of the race when she was a sure winner. She had an allowance from the others, and was leading them on elapsed time, with only a mile and a half to go.

Oriana was designed by H. C. McLeod, now of the Minnetonka Y. C., whose reputation as a designer is known to the readers of FOREST AND STREAM. Avis has surprised everybody by proving herself a failure in light winds, as her light draft was supposed to make her easily driven. She has been fitted with a steel centerboard hanging 6ft. below her keel, and with 500lbs. of lead on the bottom of it. She will have this board hinged next year, and the after part widened to admit of the housing of the lead, which is 2in. thick and 14in. high. She was built by Albert Henderson, and is owned by M. R. Benn.

St. Louis Y. C. Annual Regatta.

ST. LOUIS, MO.—MISSISSIPPI RIVER.

THE St. Louis Y. C. held its second annual regatta on Oct. 8 on the Mississippi River, off the city, with races for the 15ft. class, 18ft. class, 24ft. class and launches. The wind was very light all day. The winners were:

15FT. CLASS.

	Elapsed.		Elapsed.
Marion	1 40 00	Phantom	Withdrew.
Monitor	1 41 53		

18FT. CLASS.

Grace	0 46 30	Luella	1 10 40
Myrtle	0 54 31		

24FT. CLASS.

Teaser	0 47 38	Lucille	0 48 00
Evelyn	0 51 36	La Czarina	Withdrew.
Marywood	0 47 32		

Marywood and Lucille were disqualified for turning the stakeboats from the wrong side.

Three launches were entered for the St. Louis Y. C. challenge cup and the Medart challenge cup, but Virginio failed to start, and El Rio Rey, a new boat, was unable to secure a Government inspection in time for the race, so only Ouatoga started, she being awarded both cups.

Yacht Race at Peoria.

ON Oct. 10 a yacht race was sailed on the Illinois River at Peoria, Ill., in a fresh easterly breeze, the times being:

	Length.	Start.	Finish.	Elapsed.	Corrected.
Mary Adams	15.00	11 21 00	1 01 00	1 40 00	1 40 00
Growler, cat	21.00	11 11 00	1 02 00	1 51 00	1 41 00
Cinch	15.00	11 09 00	1 03 00	1 54 00	1 42 00
Gentle Breezes	15.00	11 09 00	1 06 00	1 57 00	1 45 00
Trilby	15.00	11 16 00	1 15 00	1 59 00	1 54 00
Racer	15.00	11 18 00	1 16 00	1 58 00	1 55 00
Idler	15.00	11 02 00	1 22 00	2 20 00	2 01 00
Alice, sloop	18.00	11 06 00	Withdrew.		

The course was two rounds of a 15-mile triangle.

YACHTING NEWS NOTES.

The Lincoln Park Y. C. is not to have things its own way in the matter of fighting next season to recover the international trophy so ingloriously wrested from it by the Royal Canadian Y. C. last month. Toledo and Cleveland have both entered the lists, and the yacht clubs of each of those cities have announced their intention to build boats during the winter for the purpose of competing in a series of trial races for the honor of challenging the Canadians. As the Lincoln Park Y. C.'s challenge has been refused by the Canadians, the field is now open to other clubs, and the plan of a series of trial races between boats representing the two upper lake associations will be urged by the Lake Erie people. In this connection the Interlake Yachting Association of Lake Erie and the Lake Yacht Racing Association of Lake Ontario are urging a speedy solution of the uniform racing rules question. Æmelius Jarvis, of Toronto, has written the officers of the other associations asking that an early date be set for a conference between delegates of the three associations, to consider this question and establish a uniform basis of measurement and racing rules. The Interlake Association, of Cleveland, has left this matter entirely in the hands of E. W. Radder, of the Cleveland Y. C., who was appointed a committee of one to formulate a plan. He is now ready to propose a basis that will be satisfactory to his association, and it is announced a call for a conference will be sent out in a few days by Com. George H. Worthington to the officers of the other two associations. So far the Lake Michigan Yachting Association has not taken any steps toward appointing a committee for this purpose, but such action will be taken as soon as the call is received. The L. M. Y. A. will favor a committee of three from each association, in order that both sides of the overhang tax question may be represented.—*Chicago Times-Herald.*

The Larchmont Y. C. will hold a special meeting on Oct. 28 to consider a number of amendments to the racing rules, of similar tenor to those recently adopted by the New York Y. C. The classification, carried down further than the New York Y. C., is as follows:

Schooners—Series A.—Class A—All over 95ft. racing length. Class B—Not over 95 and over 85ft. racing length. Class C—Not over 85 and over 75ft. racing length. Class D—Not over 75 and over 65ft. racing length. Class F—Not over 65ft. racing length.

Sloops, Cutters and Yawls.—Class G—All over 70ft. racing length. Class H—Not over 70 and over 60ft. racing length. Class J—Not over 60 and over 51ft. racing length.

Series B.—Class K—Not over 51 and over 43ft. racing length. Class L—Not over 43 and over 36ft. racing length. Class M—Not over 36 and over 30ft. racing length. Class N—Not over 30 and over 25ft. racing length.

Series C.—Class P—Not over 25 and over 20ft. racing length. Class Q—Not over 20ft. racing length.

Mainsail Yachts.—Class S—All over 25ft. racing length. Class T—Not over 25 and over 20ft. racing length. Class V—Not over 20ft. racing length.

The limits of draft are:

Schooners—Class A—Over 95ft.; draft, no limit. Class B—Not over 95ft.; draft, 14ft. Class C—Not over 85ft.; 13ft. Class D—Not over 75ft.; 12ft. Class F—Not over 65ft.; 11ft.

Sloops, Cutters and Yawls—Class G—Over 70ft; draft, no limit. Class H—Not over 70ft.; draft, 13ft. Class J—Not over 60ft.; 11ft. 6in. Class K—Not over 51ft.; 10ft. 3in. Class L—Not over 43ft.; 9ft. Class M—Not over 36ft.; 8ft. Class N—Not over 30ft.; 7ft. Class P—Not over 25ft.; 6ft. Class Q—Not over 20ft.; 5ft.

Mainsail Yachts—Class S—Over 25ft.; draft, 7ft. Class T—Not over 25ft.; 6ft. Class V—Not over 20ft.; 5ft.

The following is also proposed:

There shall be a spring regatta to be sailed on the third Saturday in June of each year.

An annual regatta on the Fourth of July of each year.

A race week, commencing the third Saturday in July and ending the fourth Saturday in July of each year.

A special race on the Saturday previous to the first Monday in September.

A fall regatta (on Labor Day) the first Monday in September.

A special race on the second Saturday in September.

Ralph N. Ellis, of the New York, Seawanhaka, Larchmont and other clubs, former owner of the sloop Regina and the schooner Iroquois, and this year owner of the successful 30-footer Hera, was badly injured on Oct. 22 by a fall from a horse while hunting at Hempstead, L. I.

The Council of the Yacht Racing Union of Long Island Sound will meet on Oct. 29 to consider a number of proposed amendments to the racing rules which will be submitted to the Union in December.

Mr. A. Cary Smith is at work on a design, for a Larchmont yachtsman, of a yawl after the general type of Audax, but wider, her dimensions being: over all 46ft., l.w.l. 30ft., beam 12ft. 6in. She will be handsomely finished and comfortably fitted up. Like Audax, she is intended for cruising, with good head room, and also for occasional racing.

Marietta II. has been sold by H. B. Moore to Alfred Carr, of New York.

Vanessa, the 21ft. fin-keel, has been sold by A. Bigelow, Jr., to Mr. Merriman, of Providence.

Canoeing.

Important if True.

THE *Yachtsman* is answerable for the following statement, which cannot fail to interest American canoeists; we hope that it will not discourage entirely the planning and building of new canoes and the refitting of the old racers: "According to a calculation made by Mr. Howard, the R. C. C. challenge cup winner this year, he finds that had he raced Yankee at the A. C. A. meet he would have beaten any canoe there, basing this calculation on the time he occupied in sailing the R. C. C. course at Burnham, and the conditions of wind and tide as compared with the A. C. A. course and the time occupied by the winner of the trophy over it."

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

Rifle Range and Gallery.

RIFLE MATCHES IN THE TYROL.

UNTIL quite lately rifle shooting was a national amusement in the German-speaking portion of Tyrol. In the most remote and poorest mountain hamlet the *Scheibenstand* (rifle range) was one of the three never absent attractions—the church, with its melodious chime of bells, and the inn, with its sturdy *Kellnerin*, sharing to an equal measure the *fête* day leisure of the entire adult male population. For centuries rifle practice held a foremost rank in the minds of the patriotic Tyrolese, and the skill they acquired at their little village ranges made them, as history has proved, most formidable foes in time of war. Although the formation of the country undoubtedly assisted its defenders, their deadly marksmanship was one of the chief factors of their extraordinary success. A handful of choice shots ambushed in the pass or gorge through which the invading enemy was obliged to pass enabled them to score a victory on many occasions when the odds against them were as heavy as ten to one. Every peasant owned his rifle, handed down to him from his father, who in turn had inherited it from his sire. Many rifles which I have myself handled in bygone years at village rifle matches were of venerable age and surprisingly unwieldy shape; the rough handiwork of the village blacksmith plainly betokened that the weapon had once been a "wheel-lock," had been subsequently turned into a flint-lock, and only recently had been furnished with the more modern percussion lock. Indeed, when first I began to take part in these country matches, twenty-five years ago, several of the white-haired old guard, then still alive, were using flint-locks, in the loading of which the belief in charms and superstition had considerable weight. They invariably shot spherical balls of large caliber; for the conical cannelured ball of about .400 bore came into general use only about thirty years ago, and then only among the younger generation of marksmen. With the latter very good shooting was made at short ranges, the ordinary distance being 130 meters, or 142yds. The firing position was then, as it is now, the standing one, without artificial rest of any kind. The old match rifles had not only a hair trigger, but were furnished with a knob a couple of inches behind the hammer connected with the trigger arrangement, so that the latter would only work when this knob was pressed down, which was done by the thumb of the right hand. The trigger guard, which reached far back, had indentations into which the three disengaged fingers of that hand were laid, giving one a firm grip, corresponding to the pistol grip on modern rifles. The heel plate was not straight or slightly curved, but was concave, and thus fitted the marksman's shoulder. A fine peep-sight and equally fine bead in a short tube were the ordinary sights for target shooting, no middle sight being used. If the rifle was wanted for warlike purposes—a use to which many of the old arms were put—a coarse front and middle sight were substituted for the target sights. It was a heavy rifle, weighing from 9 to 14lbs. As a rule only stationary targets were fired at, the whole arrangement of targets, marking and scoring being primitively simple, yet, as will be seen, sufficient for the purposes. To catch the bullets a section of a hardwood tree or well-seasoned larch, some 3ft. in diameter, and of about the same thickness, was firmly fixed on a pile driven into the soil, so that the center of the block was about 4ft. from the

TYROLESE TARGET.

ground. On the face of this block was fixed the board upon which was fastened the target—a piece of cardboard 9½in. square, with the bull printed on it in black. The bull, as it presented itself to the marksman, measured 7in. in diameter, but the diameter of the real mark that had to be hit in order to score at all was considerably smaller, being 5$\frac{1}{10}$in. (English) in diameter. This inner bull was again subdivided by three rings into four spaces. The innermost circle, ¾in. in diameter—about the size of a sixpenny piece—counted four points; the next ring, 1$\frac{7}{8}$in. in diameter, counting three points; the next, 3$\frac{3}{4}$in. in diameter, scoring two; while the outermost ring, measuring, as already mentioned, 5$\frac{1}{10}$in. in diameter, added one point to the marksman's score.

The principle that governs the scoring at Tyrolese rifle matches is not the same as that in use with us; it favors the tyro and amateur rather than the professional crack shot—at least so far as the prizes are concerned; while our English method prevails in respect to the money pools. The prizes are gained not by the best averages or by the best string of shots, but by those individual single shots which chance to be nearest the mathematical center of the bull. This center, called centrum, is the point of intersection of two lines at right angles to each other—see illustration. By adopting this principle, luck is allowed to play a *rôle*, so that the merest beginner who is lucky enough to fluke a shot into the centrum of the bull may win one of the prizes, and thus feel encouraged to go on practicing, with the result that he finally becomes a first-class shot. At first glance this principle appears contrary to common sense, but experience has amply proved that in view of the practical utility of encouraging rifle shooting as a national sport, which can only be achieved by encouraging the beginner, its advantages cannot be denied.

To understand its working let me describe how one of these village rifle matches is managed. The giver of the prizes is almost invariably the village innkeeper, near whose house the rifle range is usually constructed; at least in the remoter valleys, where suitable open spaces with rising ground at the back can be found in the middle of the straggling village. With mine host this prize-giving is a mere matter of business, and the £3 or £4 he spends in the gaudy silk handkerchiefs and ribands, on which the silver or gold pieces of money are securely sewn, he receives back by an increased consumption of his liquor, and by certain incomings, the details of which will be presently given. The cost of the markers and of the scorers he likewise bears, or they are covered by retaining a small percentage of the pools. These details are arranged between himself and the *Schützenmeister*, or master of the village rifle-shooting guild, who is elected by the enrolled rifle shots belonging to that particular community. The latter is treasurer as well as judge in all matters in dispute, and his decision cannot be challenged, and, as he has to divide the pools, his arithmetic has to be up to date. The match, in the case of a small one day's shoot, has been announced by a placard nailed to the door of the inn, or if it is a larger match it may have been deemed important enough to warrant an advertisement in the one weekly newspaper taken in by the innkeepers, so that the news would reach quarters to which the gossip of the valley would not penetrate in the ordinary course of events. But we will confine ourselves to a match of the former description; for these small shoots, occurring every second or third Sunday throughout the summer, were the real school in which young peasants learnt to handle their rifles. Even the smallest village rifle range had two targets; but, however great the number was, the nature of the events which they helped to decide remained the same. The principal match was the *haupt* or chief match, to which one of the two targets was exclusively devoted. The shots fired by the competitors in this event were limited in number, usually four or six. Each of these shots cost from 1s. upward, the total forming a pool, which was divided in the following manner: Say that mine host had given three prizes for the *haupt* event, and that thirty marksmen competed, who each fired six chief shots, so that there would be 180 shots on the target. The three prizes would be won by the three shots that were nearest the centrum, and as probably all three had struck the mathematical center, a new bull had been fixed on the block after each of these events so as to prevent mistakes. Some very close measuring with an instrument capable of ascertaining $\frac{1}{250}$in. was often necessary to decide the sequence of the three prize shots.

[TO BE CONTINUED.]

Election Day at Cypress Hills Park.

We have received a circular describing the fourth grand annual rifle championship match, which will be held at Henry J. Bookman's Cypress Hills Park, Brooklyn, N. Y., on Election Day, Nov. 3. The programme promises some grand sport for riflemen.

The main contest is for the championship trophy presented by Gus Zimmermann, the trophy to be won by the man making the highest 100-shot score. Mr. Bookman also presents a trophy to go to the man making the best 10-shot score in the match, with the proviso that in case the winner of the Zimmermann trophy makes the best 10-shot score, the Bookman trophy shall go to the man making the next best 10-shot score.

The conditions of the shoot are: Open to all, 100 shots per man, German ring target, $5 entrance. No entries received after Oct. 31. Entries should be made to Charles G. Zettler, 219 Bowery, New York city, each entry being accompanied by a forfeit of $2. No entries will be received after the above date. After deducting the expenses of the targets and the suppers for the contestants, the balance of the entrance fees will be divided half winners and half losers.

The targets will be open for practice at 9 A. M., the match being started promptly at 10 o'clock. Ten sighting shots will be allowed all contestants not present when the match commences. There will be an intermission of half an hour, 1 to 1:30 P. M., for lunch.

The match will be shot under the management of the following committee: Gus Zimmerman, chairman; B. Walther, Ignatz Martin, Henry D. Muller and Geo. W. Plaisted; Chas. G. Zettler, Treasurer, and Bernhard Zettler, Shooting Master.

Rifle Match at Philadelphia.

Philadelphia, Pa., Oct. 16.—A match took place this evening between the employees at the George V. Cresson works and the employees of the Midvale steel works. The shoot was held on the range of the Wahnetah Rifle Club, 3935 Germantown avenue, this city. There was a large attendance of spectators, who watched the shooting with much interest. Scores, 25yds. range, 20 shots per man:

Midvale Team.		Cresson Team.	
A Wagner	64	P F Yost	64
C Briney, Jr.	62	Hubbard	49
J Yost	62	Butler	41
T O'Hara	53	McFarland	38
W Uttley	50	Halligan	37
E Hansberry	43	Kolb	33

W Shomo	24—464	Weisse	11—365

J. S. Sheets.

Revolver Shooting in England.

London, England, Oct. 8.—Below is the latest news on revolver shooting contests in this city:

At the North London Rifle Club on Sept. 30 the revolver competition was for alternate hands at a stationary target at 20yds. Results below:

Holmes	756776—38	Chicken	765745—34
C Knapp	766667—38	Britton	407777—32
Capt Evans	767466—37	Denyer	575554—31
Capt T W Heath	735777—36	Ward	455463—27
Lieut J Howard	665747—35	Franzmann	223456—22
W Luff	667547—35	T H Howe	452404—17
Andrews	755476—34	Roberts	326040—15

Oct. 7.—Disappearing target, 20yds:

Capt W Evans	776542—31	Brading	764432—28
W Luff	766542—30	Lieut Richardson	766532—29
T Knapp	775432—28	T H Howe	865530—24
Britton	754442—26	Chicken	554322—21

The scores for the revolver championship of the club now stand as below. There are only two more weekly shoots, both at 20yds., stationary target, so that Mr. Winans cannot now be beaten, and he does not intend to shoot any more this year (as seen by reports for some weeks back, he has had such a lead that he does not have to shoot).

20yds.—Series 1.		Series 2.	Series 3.	Series 4	Total.
Walter Winans	42 41 41 40 40 40	38	39	37 36	394
A W Carter	40 38 38 36 36 36	31	35	34 34	363
Capt W Evans	38 36 36 36 35 34	35	31	33 31	353
C Knapp	39 37 37 36 35 34	39	33	33 33	357
Holmes	38 37 36 35 33 30	38	34	33 33	348
Lieut Howard	41 38 38 38 36 34	36	24	34 29	348

C Knapp	40 39 39 39 38	36 36 35—302
E Clementi-Smith	38 38 38 37 37	38 35 34—295
W B Reid	36 35 34 33 33	35 33 29—274
Malschinger	38 33 30 29 27	32 29 25—243

New York Militia Arm.

Gov. Morton has declined to approve the report of the commission on an arm for the National Guard in favor of the Savage rifle. He says:

"During the interval since the passage of this law I have given the subject attention and have been favored with the opinions of many persons of high authority in military affairs, and I am advised that even the Remington rifle now in use by our National Guard, and particularly the Springfield rifle in use by the National Guard of other States, are much better for the use of the Guard when called into active service in the State in maintaining peace or suppressing disorders than a magazine gun such as is perhaps contemplated by the statute and the report of the examiners. * * *

"I am also advised that the United States Government has on hand about 240,000 Springfield rifles; that they are available for use by the militia, and that a movement has been initiated to furnish them to the several States as desired. * * * In view of the probability of the distribution of arms by the national Government, and especially at a time of great business depression and a continued unsettled condition of financial affairs, it would be unwise, I think, to approve a report which would require a contract for the purchase of arms at a possible expense to the State of $300,000."

Cincinnati Rifle Association.

Cincinnati, O., Oct. 18.—The following scores were made by members of the Cincinnati Rifle Association at their range to day. Conditions: 200yds., off-hand, at the standard target, 7 ring black. Capt. Gindele is making some very creditable scores with his new Zischang .32-40 barrel. He is well pleased with its work thus far.

Gindele.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

Oct. 29-30.—Dexter Park, L. I.—Tournament under the auspices of the Emerald Gun Club, of New York. First day, targets; second day, live birds.

Nov. 3.—Marion, N. J.—Contest for the Austin Powder Company's trophy for the tri-State (New York, New Jersey and Pennsylvania) championship at expert rules. Match commences at 1 P. M. prompt.

Nov. 7.—Hackensack, N. J.—Cup contest, under the auspices of the Bergen County Gun Club. C. O. Gardiner, Sec'y.

Dec. 1-3.—Trenton, N. J.—Proposed contest for live-bird championship; 100 live birds per man, $100 entry. Under the management of Charles Zwirlein.

1897.

Jan. 4-5.—Prescott, Arizona.—Fourth annual tournament of the Arizona State Sportsmen's Association, under the auspices of the Prescott Gun Club. Roy Hill, Sec'y.

January.—San Antonio, Tex.—Second midwinter tournament, under the management of Oscar Guessaz, etc.

March 23-25.—New York City.—The Interstate Association's fifth annual Grand American Handicap at live birds.

April 15-17.—San Antonio, Tex.—Tournament of the San Antonio Gun Club. Open to amateurs only. Willard T. Simpson, Chairman Ex. Com.

May 11-14.—Oil City, Pa.—Seventh annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. Targets and live birds. Black powder barred. Special event: 25 live birds per man, $25, $1,000 guaranteed. Send entries to H. C. Reeser, Sec'y, Oil City, Pa.

June (third week).—Cleveland, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

DRIVERS AND TWISTERS.

Club secretaries are invited to send their scores for publication in these columns, also any news notes they may care to have printed. Ties in all events are considered as divided unless otherwise reported. Mail all such matter to Forest and Stream Publishing Company, 346 Broadway, New York.

Chic, a weekly paper published in Cincinnati, O., in its issue of Oct. 10 runs as a frontispiece a reproduction from a photograph of the familiar features of Lieut. Peter Gibson, of the O. N. G., and also gives the following account of the lieutenant's latest appointment—chief of the Signal Service: "In the last Ohio Legislature there was passed a bill which created a new office in the regiment, the chief of the Signal Service. The signal service implies a communication between distant military points by means of the sun, heliograph, lanterns, torches and flags, with a skillfully arranged alphabet of signals. For this important office Lieut. Peter Gibson, assistant inspector of rifle practice, a position which he held for five years with much credit to himself, was recently chosen by Col. Hunt, an appointment which has met with general satisfaction in the regiment. Lieut. Gibson has devoted much time to the study of firearms as used by the armies of all civilized nations. During a sojourn in Europe he collected specimens of military firearms of the latest and most modern patterns, which no doubt will be utilized in the wars of the future. His collection is complete and is assorted in an especial apartment in the armory. Lieut. Gibson became a member of the bar in the year 1878, and has been practicing law since that time. He has been admitted to practice in the United States District and Circuit Courts, and also in the New York Supreme Court."

The Stockton, Cal., Gun Club closed a successful season on Oct. 11 last. The San Francisco *Examiner* of Oct. 12 gives the following item in regard to the club's record for 1896: "The last shoot of the Stockton Gun Club for the season of 1896 was held this afternoon in a heavy wind. H. G. Balkwell won the championship class medal by a score of 197 out of 240; average 821. George E. Ellis won the first class medal, score 187 out of 240, average .777. Geo. P. Schaefer won the second class medal, 167 out of 240, average .695. W. E. Johnson won the third class medal, 142 out of 240, an average of .591. The best scores of to-day's club shoot were: H. Ralph 19, H. Loujars 17, W. E. Johnson 17, H. Condy 17, W. Jensen 17, G. E. Ellis 17, C. Merrill 16, H. G. Balkwell 15, G. P. Schaefer 15, E. Gample 15, George Ditz, Jr., 15."

The Parkway Rod and Gun Club, of Brooklyn, has opened new grounds at the corner of Miller and Wortman avenues. The new grounds are said to be a portion of the Bennett-Selover farm. Mr. Bennett is ex-president of the club, and Selover is its present field captain. For years past the club has been in the habit of holding its monthly shoots at Dexter Park, but until now was unable to secure a suitable piece of ground for a club house and set of traps.

Justus von Lengerke is answerable for a diminution of the ruffed grouse and woodcock supply of this State since the season opened. Justus is a good man at the traps, but we are told he is a much worse man to stack up against when he gets you in the woods. A man who had been shooting with him once said to us the other day: "You just ought to see that Dutchman walk and shoot! Whew!"

The cup offered by the Austin Powder Company for competition on the grounds of the Endeavor Gun Club, Nov. 3, is to be the Austin Powder Company's tri-State championship cup at expert rules. The States named are Pennsylvania, New Jersey and New York. The entrance fee is only $5, and that sum covers the cost of the 50 targets shot at and the cost of ammunition, as the "147" load will be furnished free of charge to those entering as above.

Winston's win of two out of his three matches last week at Elkwood Park stamps him as a good shot, better perhaps than many people imagine. We have heard several opinions expressed lately as to his capabilities as a live-bird shot, and there seems to be just as much difference in those opinions now as there was ten days ago. His victory over Ivins was a genuine surprise to us, as Ivins is looked upon as a man that is hard to beat on any kind of birds.

It looked like old times to see Ferd. Van Dyke, of the Winchester Company, cracking targets at the Endeavor Gun Club's tournament, at Marion, N. J., on Oct. 23-24. Van was, perhaps, not in his best form, but then the targets on both days were hard to locate. His 48 out of 50 in the 2d and 3d strings of 25 each in the 100-target handicap race on the last day was a capital piece of shooting, the strong northwest wind making the shooting very hard.

From what one hears, and if what one hears is true, Zwirlein's big shoot on Dec. 1-3 is going to be rather bigger than he wants it to be; that is, if he only wants ten or twelve shooters to compete for the championship. There are a whole host of champions here in the East who want a whack at the big purse, and we expect to hear something to the point from the Westerners before many days.

Mr. W. F. Parker, a son of one of the members of the well-known gun firm of Meriden, Conn., was a new face at the Jersey traps during the Endeavor Gun Club's merchandise shoot at Marion, N. J., Oct. 23-24. Mr. Parker, while perhaps not an expert yet, showed that he was not only fond of a gun, but knew how to handle one. The way the targets flew on the above dates was not calculated to make a new hand show his best work.

Everything points to a good entry list for the Tri-State cup shoot at Marion, N. J., on Nov. 3. The only trouble is that targets thrown at expert rules are so seldom shot that very few people know what they can do at that style of shooting, and are therefore afraid to come and try their skill. This will be a good chance for any such to measure their skill against some of those who are supposed to "know it all" at a comparatively low figure.

The last two days of this week, Oct. 30-31, will see some good shooting at Dexter Park, L. I., if the weather is anything like favorable. The tournament to be held on those dates will be under the auspices of the Emerald Gun Club, of New York, one of the leading organizations of the kind in this city. Friday, Oct. 30, will be target day, live birds being trapped on Saturday.

Charlie Budd has not forgotten how to shoot. On the second day of the Des Moines, Ia., Gun Club's tournament, Oct. 21, he shot at 36 live birds and scored them all; he then shot at 105 targets, losing only one, his 104th. His average for the day, animates and inanimates, was better than 99 per cent. for 141 shot at. Budd used a Parker gun, E. C. powder and U. M. C. factory-loaded ammunition.

The cup presented by the Austin Powder Company as a "Tri-State championship cup" is a handsome trophy and well worth winning. The "147" load must be used and will be furnished with the 50 targets shot at, for the $5 entrance fee. Balance of entrance fees divided into three moneys. The date of the contest is Nov. 3 (Election Day) at 1 P. M. prompt.

The information we give elsewhere in regard to the new shooting grounds now in course of construction at Elkwood Park should prove interesting reading to trap-shooters in general, and to all those in particular who took part in the Grand American Handicap of 1896. When finished, these grounds in point of equipment will compare favorably with any in the world.

Ed. Taylor, of Laflin & Rand, has just about gotten acclimated. Mr. Taylor told us on Saturday last, whether for publication or not we cannot say, neither do we care much, that he is liable to cause trouble any time anybody talks "match" to him. "If only Peter Gibson were here now!" he said; and he shook his fist at the imaginary Peter.

Frank Butler and Mrs. Butler (Annie Oakley) are taking a hunting trip through Arkansas. Mrs. Butler, now that Buffalo Bill's Wild West show has closed for the season, is thoroughly enjoying her well-earned holiday. Frank Butler writes that they will be in New York some time in December.

With Fred Quimby out West on a business trip and Charlie Hebbard down East trying his best to scare moose in Maine, life around Fred's desk in his new location, 300 Broadway, has been decidedly dull, except when Tom Keller was on hand. There was life then, and plenty of it.

In a personal letter to us on trap-shooting matters, W. L. Colville (Dick Swiveller) adds as a postscript: "Look at our change of 'adv.' if you want to see what Gold Dust has been doing on the Pacific slope."

L. T. Duryea, the well known amateur pigeon shot of this city, has started on a trip to the Pacific slope. Mr. Duryea will probably not be back in this vicinity again until some time in December.

The Hill School, of Pottstown, Pa., has organized a gun club and commenced practice shooting at targets. The first shoot was held on Oct. 22.

Oct. 27. Edward Banks.

Warren Gun Club.

Warren, O., Oct. 21.—Inclosed find scores made at our club shoot held this date. We had with us Mr. R. O. Heikes, of Dayton, O., who gave a nice exhibition of fancy shooting by breaking 5 targets thrown into the air at one time. He also broke 50 targets in two minutes and twenty seconds, using three repeaters and shooting fifty-nine times.

This was Mr. Heikes's first appearance among us, but we will all be pleased to see him again at any time. Scores:

Dave Elliott, Sec'y.

Elkwood Park's New Shooting Grounds.

Our visit to Elkwood Park on Tuesday, Oct. 20, was extremely well-timed. We had started originally with a view to witnessing the Winston-Hoey match, and incidentally looking over the plans for some new shooting grounds at Elkwood, which we had been told were about to be laid out by Phil Daly, Sr., of Long Branch, N. J. We had no idea that the grounds were so far advanced in course of construction that nothing, practically speaking, beyond the erection of the new club house is needed before live-bird shooting can be pursued on the best planned grounds in this or any other country. We say "best planned" advisedly, for, barring one small item which we shall refer to later on, the new grounds at Elkwood Park will be perfect, nothing having been left to chance.

THE "CLOVER-LEAF FIELD."

In Forest and Stream of Aug. 29 our Chicago correspondent, Mr. Hough, gave under the head of "Three New Ideas" a plan for laying our three sets of traps in the shape of a clover leaf. The publication of this plan, together with the cut illustrating the idea, was undoubtedly a prime factor in the present movement at Elkwood Park. The idea was not altogether a new one, for a similar scheme, only for a four-leafed system of grounds, has been mooted many times during the past few years. The promoters suggested a club house in the middle of four sets of traps, one on each side of the house, thus insuring a straightaway wind on one set, no matter from what quarter of the

ELKWOOD PARK AND ITS NEW SHOOTING GROUNDS.

heavens the wind blew. Members of the club and their guests, whenever a match was in progress, were to reach the club house by means of a well-lighted tunnel.

There is also, we believe, a diagram of some such scheme hanging now, where it has hung for years, on the walls of the Riverton Gun Club's house at Riverton, N. J.

The above schemes, however, brought forth little else than talk. It has remained for Mr. Phil Daly, Sr., and his son, Phil Daly, Jr., to be the first to go to work and lay out a real clover-leaf field after the plan so graphically described in Forest and Stream of Aug. 29 of this year.

A FIFTEEN-ACRE LOT PURCHASED.

The proprietors of Elkwood Park realized that some such shooting grounds were needed, and that when once established there would always be a chance for any one desiring to shoot a match to get a suitable place for deciding it at the shortest possible notice. Around New York there are not many such places. As a matter of fact, shooters from this city and vicinity are none too well provided for in this respect. To lay out such a set of traps on the clover-leaf plan requires ample space; it actually takes about fifteen acres to do it properly. Accordingly Mr. Daly spent a good many dollars in getting possession of a plot of fifteen acres that lies to the west of Elkwood Park, but adjoining that property. It is on that fifteen acres that is now located the "clover leaf."

The accompanying diagram will explain thoroughly to those who were present at the last Grand American Handicap, held in March, 1896, at Elkwood Park, the exact location of this tract of fifteen acres. On it will be noticed the grand stand, the old shooting grounds where the Grand American was actually decided, the Elkwood Inn, and other familiar landmarks, such as the stables for trotting stock, etc. We do not boast that the plan is drawn accurately—that is, so many feet to the inch—but we do brag that it will convey an excellent idea of the present new grounds and their location to any one who has visited Elkwood Park.

THE CLUB HOUSE.

Although the grounds are not in working order, and although it is not proposed to open them before Dec. 1 at the earliest, they are so far advanced that every little detail can be seen. No start has been made on the club house, but probably before this reaches our readers ground will have been broken for its foundations. The building itself will be absolutely perfect, every desire of a shooter having been thought out and provided for. We were amazed when we realized the completeness of detail with which the Messrs. Daly, Sr. and Jr., and Harry Chanfrau had planned the interior fittings of this large building. The total floor space of the building, which is to be two stories high, will be about 10,280sq. ft.! That is 5,140sq. ft. on each floor. In addition to this there is ample space left for a wide piazza, to run the entire length of the building, facing the three sets of traps. The front of the building will practically be all glass. There will be a wide exit on each side immediately in front of the score at each set of traps; the distance from these exits to the score respectively in front of each door will be just 40ft., scarcely enough for a shooter to get moist in a heavy downpour. Gun racks and lockers will be a prominent feature on the first floor, plenty of accommodation in these respects being supplied, however large the attendance.

Retiring rooms for ladies and for gentlemen; lavatories fitted with the best sanitary plumbing; telephonic and telegraphic communication with any point on the world's surface; press room, restaurant, baths, a cashier's office, with a railing in front of it, like a well-appointed ticket office in one of the trunk line stations of America's great railroad system; in fact, everything that can be thought of has been arranged for on the plans. On the second floor there is ample accommodation for spectators. So much for the club house.

NO DELAY IN FILLING TRAPS.

The method that will be adopted for trapping the birds will astonish anyone who has never seen the underground system adopted at Kansas City, Mo. All the birds will be trapped from underneath by trappers who will be unseen by the shooters or spectators. A deep trench, some 6½ft. deep by 4ft. wide, has been dug under the line of each set of five traps. This trench has been carefully boarded up, both top and sides, with stout planking. In this trench is located the trapper or trappers, supplied with several crates of birds. Down in this cellar-like place both trappers and birds will be actually warmer in winter and cooler in summer than if placed above the ground. The filling of each trap as soon as sprung, even if No. 1 is sprung immediately No. 5 has been filled, takes such a short space of time that 150 birds an hour is not an impossibility if the shooters can only be gotten to the score to shoot as fast.

THE DOG AND THE DEAD BIRDS OUT OF SIGHT.

To the right of each score is another cellar-like excavation. In this, sheltered from the view of shooter or spectators, stands the handler and the dog that is to retrieve the dead birds. The ground in front is cut away, making a grade, enabling the dog to get out easily, and also permitting it to see the bird as soon as it leaves the trap. After retrieving the bird the dog comes back to the handler, and the dead birds are laid out to cool off before packing, out of sight of spectators, etc.

EVERY MAN HIS OWN TRAPPER.

By a series of strong railings, everyone except referee, scorer, puller and shooter is kept well away from the score. An automatic pulling apparatus will be in position, and each shooter as he steps to the score will give the wheel a turn, thus setting the combination, which is absolutely unknown to him or the actual puller.

It will thus be seen that the Messrs. Daly and their manager, Harry Chanfrau, have thought of and provided for everything that can be devised to make pigeon shooters happy and sure of a fair deal and quick trapping. The only unfortunate thing in the whole matter, the item which we referred to earlier, is the fact that it was impossible, owing to the lay of the ground, to face one set of traps to the north instead of to the south. This, however, is a small matter; much smaller than it would be usually, as the prevailing winds in the fall, winter and spring are favorable to driving birds from traps that face slightly to the south.

THE APPROACH TO THE GROUNDS IS SAFE.

It will be noticed on the diagram that the road to the grounds from the inn takes a turn to the right in front of the manager's house, and then follows the northern boundary fence until it is in a straight line with the north end of the club house. By following this road shooters and their friends will be out of all danger of being peppered, as a rise in the ground acts as a natural screen from all stray pellets of shot.

To make access to the Elkwood Park grounds as easy as possible, all trains on the N. Y. & Long Branch R. R. will stop to set down or take up passengers on the trains that run over this line. A platform and a shelter, perhaps a station, will be built to accommodate such passengers.

Thus are the shooters of New Jersey being provided for.

Edward Banks.

Greensburg Gun Club.

Greensburg, Ind., Oct. 22.—The Greensburg Gun Club, one of the strongest as well as one of the most popular organizations of the kind in this State, held its second annual tournament on Wednesday and Thursday, Oct. 14-15, at its park to the northwest of the city. The weather was fine for shooting, with the exception that a portion of each day the wind blew quite hard. Taking it all in all, the bright October sun, shedding its warmth and glory over the beautiful landscape, made the ground a scene of surpassing beauty, and furnished an excellent background for the sport. The club had made perfect arrangements. Two sets of expert traps and electric pulls were used, and here was the only trouble. One of the pulls, although new, having just been received only a day or two before, worked very poorly from the beginning and finally had to be discarded. This was quite annoying to the club, but the shooters seemed to take it with the best of feeling, all seeming to recognize that such accidents will happen, and that the club had done all that was in their power to do in the matter. The programme for the two days contained twenty events, and these, together with a number of extras on the first day, were disposed of in regular order, there being as many as thirty shooters in a number of the events. The interest of the participants and spectators centered in the badge event on the second day. In this event there were twelve entries, and some fine scores were made—C. D. Tillson, of the Greensburg Club, winning with a score of 49 out of 50. This badge is a handsome $100 trophy, emblematic of the amateur championship of Indiana, and is contested for annually on the Greensburg Gun Club grounds under the following rules and conditions: "The contest for this badge is open to all amateurs of the State. The contest will take place annually on the grounds of the Greensburg Gun Club, and will consist of 50 targets per contestant, known traps and known angles, the club to receive 40 per cent. of the entrance money, the balance to be divided 40, 30, 20 and 10. Ties for first place will be governed by the American Association rules. No charge will be made for targets in this event, except for shooting off ties."

The fact that the trophy was won by a home man was the cause of general rejoicing upon the part of the local club, and the visitors all were delighted with the splendid showing made by the victor.

Among the visitors were the following: H. T. Hearsey, George Beck, Royal Robinson, E. H. Tripp, J. W. Cooper, Dr. Charles Everts, of Indianapolis; H. E. Norton, of Ironton, O.; R. L. Trimble, of Cincinnati, representing the Du Pont Powder Company; Frank Smith, Brookville; George Schwartzkopf, Jr., F. Thomas and Dr. Rolland, of Columbus, Ind.; J. B. Stipps, Bedford; Jacob Kirsch, Aurora; Frank Wilson and H. Harcourt, Rushville; Charles Gilchrist, Harris City; Charles Sturgis, Horace; G. Roll, F. K. Adams, J. G. Deprez, Frank Nuckols, W. Webster, Shelbyville; J. Vogler, Hope; H. M. Scott, Kentucky. Space forbids any extended mention of the individual work of the participants, but the following scores speak for themselves:

C. Jay.

Des Moines Gun Club's Annual.

Des Moines, Ia., Oct. 22.—The annual tournament of the Des Moines Gun Club, Oct. 20-22, closed to-day. The attendance was not large in numbers, but was made good by the interest taken by those who were present. The weather was fine and the shooting by a number of the contestants was well up. Two sets of target traps were used; one set threw known angles and the other unknown angles. The targets were thrown about 60yds. Those who reached 90 per cent. were few in number.

Among the noted shots from abroad were: S. A. Tucker, representing the Parker gun; Herman C. Hirschy, of the Robin Hood Powder Co.; C. M. Grimm, Fred Gilbert, Dr. Kibby, J. Kibby, Deusel, Abbott, Lane; Woodbury, from Marshalltown; Parmelee and Brucker, Omaha; J. Van Emmon, Geo. Peterson, Harkins, Cottrell, Gittens, Hoffman, Geo. Hughes, Taylor, Day, Cole, Correy, Frankie and Schales.

The best averages for the three days were: Budd first, with 95.1; Gilbert second with 94.1, Grimm third with 91.1, Parmelee fourth with 88.1. On the second day of the shoot C. W. Budd shot at 141 targets and live birds, losing his 104th target, making an average of better than 99 per cent. for the day.

The last day Marshalltown and Des Moines had a team shoot for the *Shooting and Fishing* State championship cup, 5 men on each team, 30 singles and 10 pairs to each man. Marshalltown won by 1 bird. Their many friends congratulated them on their success. One of the features of the tournament was Tucker vs. Hughes, or gold and silver. Hughes is a large, strong man, but Tucker landed him in the 42d round. Every one knows that Tucker is a talker from 'way back, and the writer never saw him put out but once, when Ed Rike put him out in the 51st round at Atchison, Kan., last April.

First Day, Oct. 20.

Events:	1	2	3	4	5	6	7	8*

A series of four team races was also shot to-day. The conditions were: four men to a team, 10 targets per man, unknown traps and angles. In each of the four shoots Greeley's team was too strong for Metcalfe's team, the following scores telling the tale:

Metcalfe's Team.	No. 1.	No. 2.	No. 3.	No. 3.
Metcalfe	1010100111—6	1000110101—5	1000010011—4	0111001011—6

J. K. V.

In New Jersey.

AT ELKWOOD PARK.

John L. Winston, who is representing the Austin Powder Co., of Cleveland, O., has established for himself in the past quite a record in Western trap-shooting circles. If he desired new fields to conquer he has certainly found them here in the East. Making certain exceptions, he came to New York city and expressed himself as willing to meet in individual matches any and all comers. The exceptions are, so far as he has told us, George Work, Louis Duryea, J. P. Knapp, Edgar Murphy and John L. Brewer. There may be others, but at present we do not recall their names.

Since his arrival he has been a busy man. Scarcely a day has gone by but what he has been out showing what he can do, and trying to find out what others can do. Several small matches have been shot, in which he was not by any means invariably victorious. He lost two small races, a 25 bird race with Charlie Zwirlein and a 50-bird race with George "One-barrel" Cubberly, both matches being shot on Zwirlein's grounds. He tied in a 100-bird race with "Count" Langen, of New York, on 77 each, but eventually won on the shoot-off at 25 birds per man by the score of 22-21. While speaking of the birds in the East and of those he shot at on Zwirlein's grounds at Yardville, N. J., in particular, Winston said to us: "Eastern birds, so far as I have seen them, outclass our Western birds more than I ever imagined could be possible. You told me I should see good birds at Zwirlein's, and I did. So good were they, and so much better were they than any I had ever shot at, that I missed 6 out of the first 14 I shot at in my match with Cubberly!"

The birds he shot at in the match with Fred. Hoey, the score of which is given below, were another fair sample of what sort of match birds can be provided for anybody who wants to shoot a race in New Jersey. The match with Hoey was the first of a series of three to be shot the week commencing Oct. 18. The feature of these three matches was the condition that all should go or none, that is, the forfeit for all three was to be posted before the first was shot. The matches were as follows: Vs. Fred. Hoey, Tuesday, Oct. 20; vs. Phil Daly, Jr., Thursday, Oct. 22; vs. A. L. Ivins, Saturday, Oct. 24. Another feature was the fact that Phil Daly, Jr., was willing to bet $200 against $150 that he could beat Winston; this bet, of course, Winston did not let slip by him.

THE WINSTON-HOEY MATCH.

Oct. 20.—The first of the above series of three matches was decided to-day at Elkwood Park. When we left New York by the 9 10 train over the P. R. R. for Branchport, the station for Elkwood Park, the wind was blowing very strongly from the southwest, with prospects of rain before night. There was a moist look about the sky in the south, and the weather bureau did not hold out very much hope of a good afternoon for live-bird shooting. As a matter of fact, the afternoon proved as satisfactory for that purpose as one could wish; the wind held up well, and rain kept off until all the early birds at least had gone to bed. A little rain to settle the dust around Elkwood Park would have been more in the nature of a blessing than a curse. As it was, dust in clouds rolled across Elkwood Park; so thick were these columns of dust and sand at times that the sun was almost shut out from view. The force of the wind varied, a conservative estimate being that it never dropped below fifteen miles an hour, while occasionally it went up to thirty miles. As its direction was favorable for good birds, guesses at the probable score were decidedly low. Anything over 82 was considered good work. (Brewer, who was present, said that he could kill in the neighborhood of 94 or 95, but then—)

The birds were a "specially selected lot." They were provided by Gilbert, of Philadelphia, Mr. Gilbert, Jr., coming over to trap them himself. They were all blue, but the blue on some of them was almost an ebony black; and some of those black ones escaped too. Left-quarterers were very numerous, but that was only to be expected, as the traps face slightly to the north of east, while the wind was from the southwest; birds that faced the wind, as some of them tried to do, were hoverers when it came to taking the direction of their flight; they could not make any headway against the wind when it was blowing its best. Under all these circumstances—wind, good birds, and, we must add, poor pulling—Winston's score of 85 was a good one, and stamps him as a dangerous man in a match, no matter who his antagonist is.

THE FORM OF THE TWO MEN.

The form displayed by the two men was as different as light from dark. It was our first experience with Winston as a match-shooter at live birds, and we were just as much pleased with his form as we were disappointed with that displayed by Fred Hoey. Of course, at the score Winston was deliberate; he is always that way when shooting matches or sweeps. To-day he stepped to the score, looked at the traps before raising his gun; then jammed the comb sharply against the cornplaster he wears on his right cheekbone to protect a sore spot, doing this, as nearly as we could count, five times before calling "Pull." It should also be noted that he omitted purposely, and so informed the puller prior to the match, the cautionary signal "Are you ready?" Once the trap was opened and the bird in the air, he was quick enough, and used his second barrel many times both rapidly and effectively. There was nothing slow about him then.

Fred Hoey, on the other hand, was almost careless in the manner he handled himself at the score. He would step up to the mark, ask "Are you ready?" receive the reply "Ready," and follow it up with a sharp "Pull." Over the sore place on his cheekbone he wore no cornplaster; when spoken to about that sore spot and being told that it was bleeding, he remarked: "Let it bleed. When I was shooting in my best form it was always bleeding." Somehow or another, whether the cheek bled or whether it didn't, Fred Hoey was clean off in his shooting; his score shows that. His time was ragged in the extreme; in fact, he can hardly be said to have had any time at all. Occasionally he would brisken up and shoot in something like his old form, bringing down the fastest birds with his first barrel and planting the second with good effect before the bird reached the ground. On other birds, fast or slow, he would apparently give them lots of time to become hard, with the result that they went away altogether. We noticed in particular that he held on to his second barrel, even on driving birds, with a persistency that sometimes made it useless when discharged. He was slow in his swing too, shooting palpably behind many of the fast quartering birds, being seemingly unable to get ahead of them, although he knew his fault as well as anyone. There was one other point we noted in regard to his change of form; that was a peculiar way he had of putting his gun tight to his shoulder as he called "Pull" and then taking it away, dropping it a little as the trap was opening. That little motion unquestionably gave the birds a start that, in the old days, they never got when he was at the score. Two years ago a score of 77 by Fred Hoey, no matter on what class of birds, would have been something for the boys to laugh at.

THE LUCK OF THE BIRDS.

In many matches the "luck of the birds" cuts quite a figure. To-day it had no effect at all on the result, except perhaps to lessen Winston's total; the latter had, if anything, the worst of the birds. Our trap score type shows that Winston had 44 left-quartering birds, direct and out-going; 11 drivers; 16 right-quartering birds, direct and out-going; 27 with an incoming tendency and 2 hoverers. Hoey also drew 44 birds with a left-quartering tendency, 5 drivers, 12 with a right-quartering tendency, 30 that were incomers and 9 hoverers and towerers. Incomers were not all "puddings" to-day; left-quartering incomers were across the deadline in a flash, while birds that left the traps with the intention of becoming direct incomers, and then curved quickly off into left-quarterers, managed to get away time and time again.

The birds lost by each man were: Winston: 6 left-quartering, 3 drivers, 3 right-quartering and 3 incomers; 15 in all. Hoey: 10 left-quartering, 2 drivers, 4 right-quartering, 6 incomers and 2 hoverers; 24 in all.

The traps fell as follows:

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.	Total.
Winston	28	18	14	23	17	100
Hoey	17	22	16	25	20	100

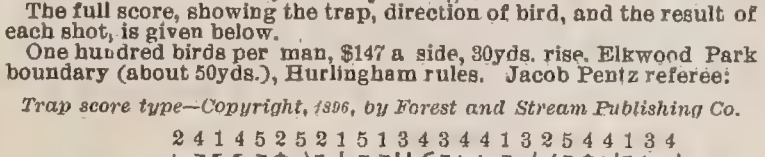
Winston drew No. 1 trap 12 times in his first 50 birds, and lost 4 out of those 12 birds; Fred Hoey in the same 50 rounds drew No. 1 trap 13 times and lost 5 of the 13 birds. The combined totals show 9 lost birds out of 25 liberated from No. 1 trap in the first 50 rounds. During the entire match Winston lost 5 from No. 1, 2 from No. 3, 3 from No. 4 and 5 from No. 5; Hoey lost 6 from No. 1, 4 from No. 2, 2 from No. 3, 7 from No. 4 and 4 from No. 5.

HOW THE MATCH WAS SHOT.

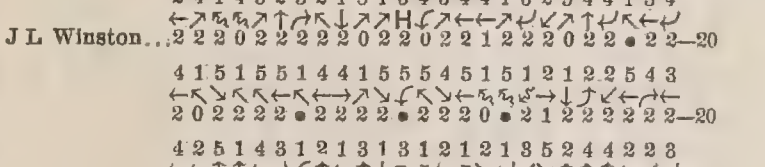
Winston won the toss, and of course elected to lead off. The first to lose a bird was Hoey, who dropped a good bird in the 3d round. Winston tied the score by losing a good one in the next round. Hoey lost a twister in the 5th round, putting Winston again ahead by one bird. Winston's 7th was an extraordinary kind of a bird. It left No. 5 trap on the jump, turned sharply to the right as Winston's gun went off; then dipped to the ground and circled sharply to the right, but straightened out in time for him to make an easy kill with his second barrel as the bird made its way up wind. In the 10th round both men lost their birds, Winston undershooting his bird from No. 5, while Hoey let a towering right-quartering driver from No. 1 get away from him. Hoey's 12th started very slowly, but suddenly quickened into a remarkably fast bird, being well stopped with the second barrel. Winston's 13th was an easy miss of a circling incomer from No. 4, tieing the score. Hoey's 14th and 15th were stopped in his best style (old style), but his 18th was lost by a piece of careless work; the bird was a sitter and had three balls thrown at it before taking wing; it flew up wind and was an easy bird, black as a crow as it sat in the air, making slow progress against the wind. It looked so easy that Hoey undershot it, the result being a goose egg on the score sheet. Winston then lost a slow towering bird in the 20th round, the score again being a tie. Hoey's 22d bird gave Winston the lead, the shooter slobbering with his first, and holding his second so long that the load of shot that missed the bird must have been like a bullet. Result: dead out of bounds. Winston hit his next bird hard with both barrels, but too far back, the bird reaching the boundary before dropping. The score was thus again a tie. The 25th round saw Hoey lose a very fast bird from the fatal No. 1 trap. The score at the quarter pole stood 20 for Winston, 19 for Hoey.

The second quarter saw the score a tie at the end of the 50th round. Winston's 27th was a low-flying bird that was hit with the first barrel, but never touched with the second, the load plowing up the dust a yard or two behind it. Another tie! Then Hoey lost his 30th, a deceptive bird that jumped in toward the shooter as the trap opened, the first load going well over its back; it then simply sat in the air, while the second load went apparently as much below it as the first had gone over it. Winston again evened matters up by losing a bird dead out of bounds in the 32d round; it was a very fast left-quartering driver, missed with the first, which was behind it, hit hard with the second, but reached the boundary. Hoey lost a bird in the 35th round, but once more Winston tied the score in the 37th round. His loss of this bird was the result of a poor piece of judgment, the shooter holding his second barrel much as Hoey did in the 22d round, the result being the same—dead out of bounds just over the wire. Hoey spoiled the tie in the 38th round by losing a fast driver from No 2 that was hit hard with both barrels. This miss Hoey followed up with 7 straight kills. The 41st round saw the score tied with the loss by Winston of a hard twister from No. 1, missed with the first, but hit hard with the second. The 42d round saw Hoey one ahead, Winston drawing the counterpart of the bird just lost, but from No. 5 trap; this time it was centered with both barrels, but the wings being good it went over the left field wire before dropping. Hoey tied the score in the 46th round by losing a fast, low-flying incomer from No. 4. Winston's 46th and 50th were both extra good birds, but not good enough to get away from the shooter, who was using much better judgment now than in the previous rounds. Thus at the close of the first half of the match the score was a tie on 40 kills, only an 80 per cent. gait!

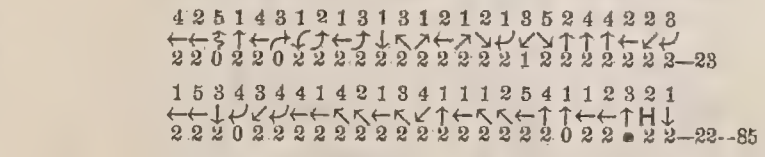
Again Winston gave Hoey a chance by losing his 53d and 56th birds. His 53d bird probably confirmed the shooter in some of his superstitions. If any one will notice Winston he always fills his pockets with carefully selected shells before going to the score. In this round he got to the score and found that he was underweight, as it were, being short in ballast by just five shells. Turning to the referee, he said: "Will you kindly hand me five shells out of that box?" (designating the particular box he meant) "I am slightly superstitious, and would rather not turn back from the score now." The shells were handed to him, pocketed, and the bird, an extra fast one, went away to the coop. His 56th was a poor piece of work; it was hit with the first as it made its way upward, but was decidedly undershot as it almost hovered in the breeze. Hoey's chance of a lead of 2 was instantly squashed by his missing his 56th bird with both barrels. Both men killed straight up to the 60th round, when Hoey tied the score for the last time in the match with the loss of a right-quartering bird that was hit with the first, centered with the second, then towered to the left, the strong wind carrying it several feet over the wire in the left field. Hoey's 63d was another black crow that was too fast for both loads, the shot from both barrels reaching the ground some feet behind the bird. This put Winston 1 to the good. Hoey made it two when he lost a very fast bird in the 66th round, shooting behind the bird again with both barrels. Winston was placed 3 in the lead when Hoey lost a honey-cooler in the 72d round. This bird started as a direct incomer from No. 5 trap, flying like a streak; it swerved just as the first barrel went off, the gun apparently pulling off, as the charge of shot plowed up the ground some distance from the bird; the second barrel was thrown away, as the blue streak flashed across the line of traps. Hoey never touched his 75th bird, and the result was a lead of 4 for Winston at the three-quarter pole.



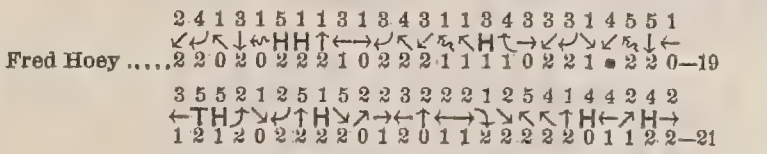
Winston lost 3 birds in the last 25. His 79th put an end to the high run of the day—22 straight; it was not a hard bird at all, but the shooter managed to place both his loads too low to do any good. He then ran 15 straight before losing another. This was his 95th, a fast driver from No. 1. His 98th was a driver from No. 3 that fell 20ft. over the boundary in center field. He thus finished the match with a total of 85 and 5 dead out of bounds.



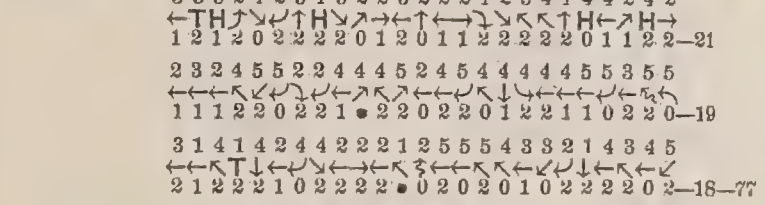
Hoey's last 25 was his poorest string, the score showing 18 kills to 7 misses. On his 82d bird he again pulled his gun off to all appearances, the charge of shot hitting the ground some feet away from the bird; as on his 72d bird, this seemed to unnerve the shooter, the second barrel being thrown away as the bird flew across the line of traps. Between the 87th and 94th rounds inclusive he lost 5 birds, only one of them dead out of bounds. His total of 77 shows plainly enough that he was not the Fred Hoey of two years ago.



The full score, showing the trap, direction of bird, and the result of each shot, is given below.



One hundred birds per man, $147 a side, 30yds. rise, Elkwood Park boundary (about 50yds.), Hurlingham rules. Jacob Pentz referee:



Trap score type—Copyright, 1896, by Forest and Stream Publishing Co.

THE WINSTON-IVINS MATCH.

Oct. 24.—Winston made it two out of three to-day by defeating A. L. Ivins, of Red Bank, N. J., over the Elkwood Park traps. The race was shot under precisely the same conditions as to number of birds, etc., as were the other matches against Hoey and Daly. The consideration was, of course, the sum of $147 a side.

The birds were the best lot trapped this week, and this means quite a good deal, as those trapped on Tuesday were a first-rate lot of birds. Winston was in the lead nearly the whole match, but Ivins caught up to him close to the finish, Winston winning by 2 birds. Ivins had a score of 85, with 8 dead out of bounds; while Winston scored 87, with 3 dead out of bounds. The strong northwesterly wind helped the birds very much, and caused the shooters to use good judgment or get left.

Winston's next, and only other match so far, is on Tuesday, Oct. 27, with "Count" Langen, of New York, a shooter whom he has already defeated over these traps. In the former match, as stated above, Winston won by one bird after tieing on 77 each out of the 100; the tie was shot off at 25 birds, Winston scoring 22 to 21.

EDWARD BANKS.

AT CARTERET.

Oct. 21.—The Wednesday afternoon shoot at the Carteret Club was well attended, eight shooters putting in an appearance at the club's grounds, Bayonne, N. J. Six events were shot during the afternoon, all miss-and-outs, $5 entrance. Some good shooting was done by Messrs. McAlpin, Wright, W. W. Watrous, Ellison and Mackay, the latter a guest of the club. The scores given below speak for themselves:

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.
G S McAlpin	2222	21222120•	122222•	21221	12•
H B Wright	220	20	2222222	22•	20
W W Watrous*	20	2222222222	0	12222	12222
J B Ellison	2212	2110	10	110	22210
W H Stafford	220	20	2122222	2222•	20
Mackay*	2222	121222222	212•	12122	122•
C W Dolan	2220	2220	1211220	10	21111
Heoner	0	122222112	21222•	12•	21212

* Mackay and Watrous missed their first birds in No. 5, but re-entered with the result shown in the above score.

The last event was a miss and out for a gun. The shoot-off was a long one, the result not being certain until the thirteenth round, in which Wright and Hooper both lost their birds and left Ellison the possessor of the gun. Prior to the commencement of this shoot Mr. Ellison told his opponents that he never lost a shoot for a gun, and added that this was to be another win for him. His prophecy proved perfectly correct. The scores were: Ellison 13, Wright and Hooper 12, Dolan 5, Stafford 4, McAlpin, Watrous and Mackay 1.

THE ENDEAVOR'S MERCHANDISE SHOOT.

The Endeavor Gun Club, of Jersey City held a two days' merchandise shoot on its grounds Marion, N. J., Oct. 23-24. A purely merchandise shoot has, so far as we are aware of, never been tried in this vicinity. This tournament must therefore be looked upon in the nature of an experiment, and as such it proved a success. In the list of entries for the 100-target handicap races are many names of shooters who have never showed up at a tournament prior to these dates. They came to shoot for merchandise prizes at remarkably low entry fees. The cheapness of the shoot, the entrance fees for each day amounting to only $3 70, as well as the desire to see what they could score out of 100 targets shot at in four 25-target events, drew many to the Marion traps who would not have been there had the tournament been one simply of sweeps for cash, no matter how low the rate of entrance might be made.

Owing to this shoot being an experiment, the management was handicapped from the start. It had not figured on the trouble caused by having to shoot off ties, and there was consequently much delay in this respect. It was also sadly short-handed in the matter of help. The absence of Carl von Lengerke, one of the promoters of the shoot, who was detained at home on account of the serious illness of his wife, was much felt. As it was, the bulk of the work, in fact, the running of the shoot, devolved on the shoulders of A. R. Strader and G. H Piercy, both of whom did very well under the circumstances. There was on the first day an unfortunate ball-up in the cashier's office in regard to getting out the squads for the 100-target race that caused quite a lot of delay. This was rectified on the second day, and the precision with which the 100-target race was shot off on Saturday, Oct. 24, was a pleasant contrast to the delays that marked that of the previous day. This goes to show that a little practice is all that is needed when it comes to running a shoot of this nature.

First Day, Oct. 23.

A late start was made in the programme events shot to-day, it being apparently a matter of impossibility to get the Jersey boys out to the traps before 11 or 12 o'clock. This fact seems to have gotten so well known that no matter what time the programme calls for the first event to be started, whether it be 9, 9:30 or 10 o'clock, shooters figure much on the following lines: "I don't suppose they'll begin the programme before 12 o'clock; at any rate there'll be nobody there before that hour. What's the use of my being early and having to wait around?" All this is the natural result of education. Instead of starting the programme on schedule time, it has grown to be customary to shoot small extra events until two or three squads are on hand. It would not be a hard matter to get the boys back into the old track again. Advertise your shoot to commence promptly at 10, 10:30 or 11 A. M., and state that you mean it. Commence punctually at the hour mentioned, whatever that may be, and however many shooters are on hand. Those who come late have then only themselves to thank for it, and they will soon learn to be on time, if they want to shoot through the programme. Just at present it is useless to commence much earlier than 11:30 for a one day or two days' shoot, with no added money for averages.

To-day, the first of the two days' shoot, was far from a pleasant one in point of weather. Before the day closed rain fell heavily, while the light after 3 o'clock in the afternoon was very bad indeed. When the ties for the first four places were shot off it was so dark that a target against the sky line was a cinch as compared with a low-thrown one. The entry list for the 100 target handicap was a large one, 39 shooters taking part in the event. The handicaps were awarded by Jacob Pentz and Maj. J M. Taylor, who based their handicaps on each man's percentage as they knew it, and then added enough targets to bring him as nearly to the 100 mark as possible. Of the four men who tied on 100 each (the highest possible), Schortemeier shot at 11 of his 12 extra targets; Dutchy at 10 of his 15 extras; Sinnock at 14, and Stanbrough at his whole allowance of 12, the latter having to break his last 3 targets to get into the 100 hole. The scores in this event were as follows:

WINSTON VERSUS PHIL DALY, JR.

Oct. 22.—The Winston-Daly match was shot to-day under favorable auspices. The air was clear, with quite a touch of late fall in it; it was, in fact, more like a day in November than an October one. The wind blew from the northwest, making birds quarter strongly to the right.

The birds shot at to-day were nothing like so good as those trapped on Tuesday, but still they were by no means a poor lot. The match was close and exciting throughout, and plenty of money changed hands during the race. The finale was a startling one: Winston, when apparently a sure winner by one bird, dropped his last two (the 100th pigeon falling dead out of bounds) and landed one behind Daly, who thus pulled out of the fire his first wager of $200 to $150 that he would win the match.

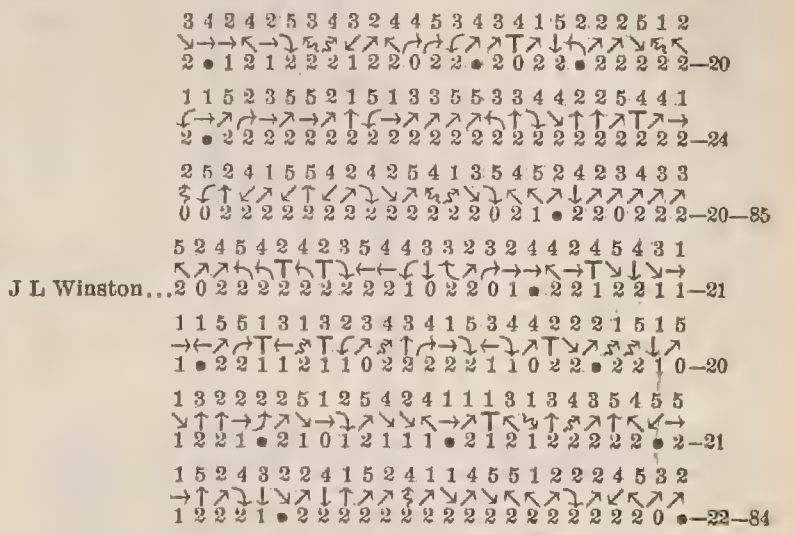
As on Tuesday, both men were tied at the half, each having 41 out of 50. In the first 50 rounds the score was tied no less than 5 times; in the 4th, 15th, 21st, 37th and 50th rounds, while in two rounds, the 16th and 27th, both men lost their birds. Winston never got in front of Daly until the 40th round, Daly also dropping his 42d bird, and giving Winston the lead by 2 birds. Out of the next 8 birds each, Daly dropped 1 and Winston 3, the score, as above stated, being a tie at the end of the 50th round.

Daly was the next to lose a bird, his 52d getting over the boundary before dropping. This again gave Winston a lead of 1, which he quickly reduced to nothing by having his 55th bird scored dead out of bounds. From this point (the 55th round) Winston never got in front of Daly until the latter dropped his 96th bird, giving Winston a lead of 1, with only 4 more to shoot at. Then came the surprise at the finish! During the last half of the match the score was tied three times—in the 55th, 94th and 99th rounds. For a brief space Daly led Winston by 3 birds—in the 74th and 75th rounds; this was quickly reduced to a lead of 1 when Daly lost his 76th and 77th birds.

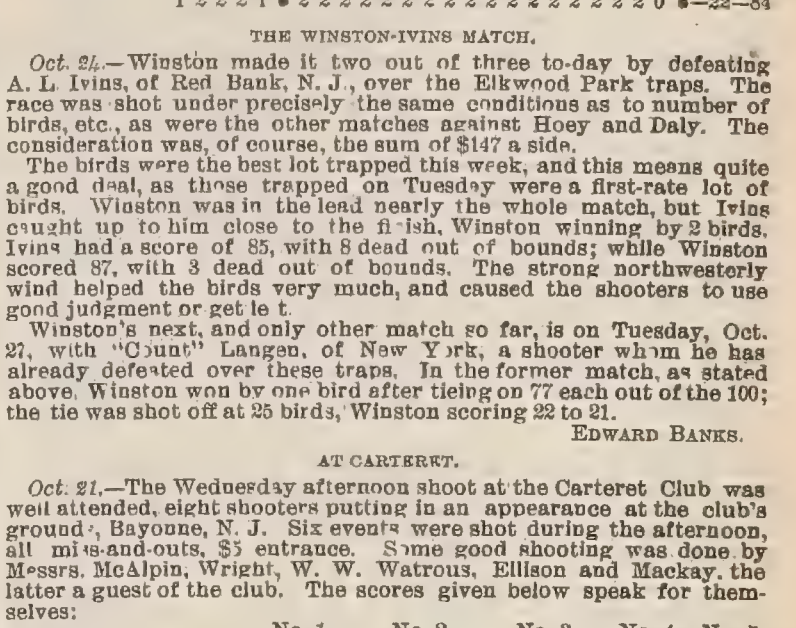
In the matter of luck of the birds Daly was, we are told, much favored, the luck running steadily against his opponent. We state this on the authority of a thoroughly impartial spectator, a gentleman specially retained to take down the full score of this race, so that readers of FOREST AND STREAM's trap columns might be able to follow the match intelligently.

The traps fell in the following manner:

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.	Total.
Daly	15	21	17	27	22	100
Winston	19	24	16	22	19	100



In the matter of birds, Daly had 13 with a left-quartering tendency, 46 with a right-quartering tendency, 9 drivers, 6 towerers and 26 with an incoming tendency. Winston's birds were 15 with an outgoing tendency, 42 with a right-quartering tendency, 10 drivers, 7 towerers and 26 with an incoming tendency. It was evidently not the difference in the direction of flights that made the difference in the draft of the birds so marked; it was the quality of the birds themselves drawn by the two shooters.



With scores so low as 85-84, long runs were bound to be scarce. Daly's double-figure runs were 23, 13 and 10; Winston's 17 and 10. A curious coincidence is the fact that this match began at exactly the same time that the match on Tuesday was started, viz., 1:58 P. M., and that it was finished on the same minute, viz., 4:20 P. M. To-day the strings of 25 each were shot in the following time: first string, 40 minutes; second string, 35 minutes; third string, 37 minutes; fourth string, 37 minutes also. On Tuesday the respective times were: 32, 36, 37 and 37 minutes.

Below is the score in detail:

One hundred live birds per man, 30yds. rise, Elkwood Park boundary, loser to pay for the birds, and Daly betting Winston $200 against $150.

Trap score type—Copyright, 1896, by Forest and Stream Publishing Co.

One-hundred-target handicap race, unknown angles, allowance of extra targets:

On the shoot-off of the ties for the first four places Schortemeier was first with 14 breaks, and thus won first choice, taking the E. C. cup, presented by the American E. C. Powder Co. Sinnock, a shooter from the Forester Gun Club, of Newark, gave Schorty a good race and did not drop out until the 14th round, thus winning second choice and choosing a breechloading double gun donated by Herman Boke & Co. "Doc" Stanbrough, of Newburgh, N. Y., was third, and Dutchy Smith, of Plainfield, N. J., was fourth. Remsen, of Brooklyn, was fifth, and chose the silver keg of W-A powder presented by the Laflin & Rand Powder Co. Twenty-five prizes in all were offered, the assortment being as varied as is usual at such shoots.

Three other small events were shot prior to the main event, the results in these being as follows:

No. 1, 15 targets, unknown angles, for three merchandise prizes, all ties to be shot off miss-and-out: Edwards 10, "147" 12, Taylor 10, G. Piercy 13, Bristol 11, Thomas 13, Ingram 13, Astfalk 6, Williams 7, Sinnock 12, Sickley 11, McAdams 7, Hollister 8, Schortemeier 14, Jewell 9, Remsen 12, Stanbrough 11, Van Dyke 13, Wood 9, Kallers 10, J. A. W. 9, Gaughen 13, Schmidt 13, Bernard 9.

No. 2, 20 targets, known angles, 4 prizes; ties shot off as above: Edwards 13, "147" 17, Taylor 16, G. Piercy 11, Bristol 16, Thomas 15, Ingram 15, Astfalk 18, James 6, Sinnock 17, Sickley 13, McAdams 15, Hollister 11, Schortemeier 17, Dr. Mulvaney 16, Remsen 13, Stanbrough 16, Van Dyke 17, Wood 10, Kallers 14, J. A. W. 12, Gaughen 16, Schmidt 15, Broward 13, Hughes 14, Herrington 12, Grant 12, Collins 18, Platt Adams 11.

No. 3, 15 targets, unknown angles, 3 prizes, ties miss-and-out: Edwards 12, "147" 11, Taylor 13, Bristol 16, Thomas 9, G. Piercy 13, Astfalk 13, Ingram 13, Van Dyke 13, Sickley 12, Stanbrough 11, Schortemeier 13, Gaughen 11, J. A. W. 12, McAdams 9, Remsen 14, Wood 8, Dutchy 14, Bernard 9, Sinnock 11, J. Fleming 7, D. Fleming 6, Greiff 12, Dr. Mulvaney 11, Platt Adams 12.

The Second Day, Oct. 24.

The strong northwest wind that swept across the Jersey meadows caused lots of trouble when it came to locating the bluerocks as they scooted and dipped before falling to the ground. Ciphers were especially numerous in many scores to-day, while very few could lay claim to a good average. It was real, downright hard shooting.

An early start was made, the two events left over from the previous day, as well as the five events scheduled to be shot prior to the commencement of the 10-target race, being shot off by a few minutes after the noon hour; all ties too had been decided. With twenty-five entries and two sets of traps, it was an easy matter to run off the main event. No. 1 squad shot its first 25 targets on No. 1 set of traps, and then moved up to No. 2 and shot its second 25 while No 2 squad was shooting its first string on No. 1 set. As soon as No. 2 squad had shot its first string it took No. 1 squad's place at No. 2 set of traps, No. 3 squad shooting meanwhile its first string at No. 1 set of traps. By this means, continuing the rotation, there was no break and no delay, the twenty-five shooters finishing their strings of 25 targets in a comparatively short space of time. The handicap allowances were all shot off on No. 1 set of traps. When all was over, it was found that there were very few ties to shoot off.

Dr. Mason, of Peekskill, N. Y., was high with 97, so the cup presented by the Schultze Powder Co., through its agents in the United States, Messrs. von Lengerke & Detmold, went up the Hudson River to stay. The Doctor broke 84 out of his first 100 and then broke 13 out of his allowance of 15 extra targets. Ed Taylor, of the Laflin & Rand Powder Co., again shot well to the front, and scored 83 out of his first 100, breaking 13 out of his allowance of 15 targets. He took second prize, the Winchester repeating shotgun, presented by the W. R. A. Co. Ferd Van Dyke, who has lately been quite a stranger at the traps, made the best score on the first 100 targets—87; he then broke his allowance of 8 extras and landed in third hole with 95. He chose the pearl scarfpin donated by Jacob Pentz, and also carried off the Remington ejector gun put up as an extra prize in an optional sweep. Remsen, of Brooklyn, as in the previous day's handicap, occupied fifth place on the list with a total of 92, scoring 85 out of his 100, but losing 3 of his 10 extras. Edwards was sixth with a total of 91, breaking 83 out of the 100 and then scoring all his extras, 8 in number. L. Piercy (122), Dr. De Wolf (125) and E Collins (112) tied for seventh place on 90 each; on the shoot-off, miss-and-out, the boy from the Endeavor Gun Club outshot his opponents, De Wolf taking eighth place from Collins. George Piercy, of the home club, was ninth with 89. The others finished in order named below, the chief surprise being the low score made by Schorty, who was clear off in his form, something that very seldom happens to him. Below are the scores, the event being shot under precisely the same conditions as the event of the previous day.

	1st 25.	2d 25.	3d 25.	4th 25.	Handicap.	Tl
P H Mason (115)	20	19	23	22	13	97

EDWARD BANKS.

FORESTER GUN CLUB, OF NEWARK.

Oct. 24.—The Forester Gun Club, of Newark, held a live-bird shoot this afternoon. Although this is the first shoot of the kind the Foresters have ever had, some good scores were made:

F Sinnock	0111111212—9	Theo Smith	0011211220—7
Wambold	02111•2211—8	Williams	2110110002—6
Dr Cummins	0011111111—8	D Fleming	01000w
H Smith	1121121110—9	Beecher	21221w

The next shoot will be at artificial targets, Saturday, Nov. 14. This will be a merchandise prize shoot, for members only. Following this will be a number of 10-bird sweepstake events, open to all amateurs. Members of all clubs will be made welcome.

H. W. WAMBOLD, Pres.

On Long Island.

ENTERPRISE ROD AND GUN CLUB.

Oct. 15.—The Enterprise Rod and Gun Club, of Brooklyn, held its regular monthly live-bird shoot this afternoon on the grounds at Bayside, L. I. Eleven members entered the club event, which is shot at 7 live birds per man. L. G. Schwartz was high with 6 out of his 7, three others tieing for second place on 5 out of 7. Scores:

L G Schwartz (26)	1112202—6	G R Samuels (26)	1202001—4
H L McTammany (28)	1002212—5	L J Harper (26)	2201020—4
D G Longman (28)	222•021—5	J V Broidey (26)	1020100—3
R V Bolton (26)	1020112—5	P H Henderson (26)	2001100—3
C L Nelson (28)	1020120—4	F F Dillon (25)	0120010—3
S G Hennessey (26)	122100•—4		

DOWN TOWN GUN CLUB.

Oct. 16.—The members of the Down Town Gun Club, of Brooklyn, held their last shoot for the season at Wissel's Ridgewood Park this afternoon. There were only three members present, a very meager representation. The club shoot is at 10 live birds, 28yds. rise. Goetz and Joost tied for first place on 7 out of 10. Scores:

	Club Shoot.	Sweepstake.
Adam Goetz	0110111022—7	0111100101—6
Wm Joost	1111100101—7	1011212211—9
Chris Steencken	1101100100—5	0212101011—7

EXCELSIOR GUN CLUB.

Oct. 19.—The shoot of the Excelsior Gun Club at Bayside, held this afternoon, was well attended, 14 members taking part in the club event at 7 live birds per man, 12-gauge guns at 26yds., 10-gauges at 25yds., for the club's diamond badge. Thomas L. Henderson won the medal by scoring his 7 birds straight. The scores were:

Thos L Henderson	2221221—7	David J Kingsland	10•2210—4
H K Helmberger	12•1222—6	Wm H Archer	2220010—4
Geo W Orton	2111101—6	David G Nelson	1022010—4
Thos E Richards	2112021—6	Anton Seegal	0021002—3
Benj C Williams	1201222—6	Wm H Wellson	011200•—3
Rich E Deegan	1022210—5	J W O'Dell	0002002—2
Sam R Williams	1222001—5	Henry K Jackson	1020000—2

IDLE HOUR GUN CLUB.

Oct. 19.—The Idle Hour Gun Club opened up the proceedings for a busy week at the Dexter Park traps this afternoon; five clubs will hold their shoots there this week. The Idle Hour Gun Club was poorly represented, only 4 members putting in an appearance. The club shoot is at 7 live birds per man, 23yds. rise for 12-gauge guns, 10-gauge guns going back 2yds. Henry Boemmermann, who tied for first place with John Bamberger, stood on the 25yds. mark, as he shoots a 10-bore; all the others were at 23yds. Scores:

Henry Boemmermann	0111111—6	J F C Elfers	0•22011—4
John Bamberger	2011121—6	Henry Hoffman	00•0111—3

EMERALD GUN CLUB, OF NEW YORK.

Oct. 20.—The regular monthly shoot of the Emerald Gun Club, of New York city, was held at Dexter Park this afternoon. As usual with these monthly gatherings of the Emeralds, there was a capital attendance of members, 29 entries being obtained in the club event at 10 live birds per man. Of that number only two—Gus E. Greiff and E. F. Dudley—killed their 10 birds. Four others scored 9 each, while two guests of the club—J. S. Remsen and A. B. Coulter—made 9 each. The birds were good ones, and were considerably helped by the strong southwesterly wind that blew across Dexter Park.

A special feature of to-day's shoot was the contest for a silver drum filled with W-A powder, donated by the Laflin & Rand Powder Co., through its representative, M. Herrington, who is a member of the Emerald Gun Club. This trophy was to go to the man making the highest score in the club race. Owing to Dudley being called away before the shoot was over, the ownership of the drum cannot be decided until some future date, Greiff having a half share in the trophy.

The scores in to-day's race were:

Gus Greiff (A, 29)	2222222222—10	G Nowak (A, 28)	1002210122— 7
E F Dudley (A, 28)	2222222222—10	W Amend (A, 28)	1022210102— 7
T Short (A, 28)	1112201221— 9	N Maesel (B, 25)	1001221012— 7
G E Loeble (A, 28)	2112011121— 9	Dr Hudson (A, 28)	1122011•00— 6

RIDGEWOOD GUN CLUB, OF BROOKLYN.

Oct. 20.—The annual meeting and the monthly live-bird shoot of the Ridgewood Gun Club, of Brooklyn, completed that club's programme for to-day. The shoot took place in the afternoon at Wissel's Ridgewood Park, the badge being won by William Sands, of Flushing, who tied with three others—C. L. Wissel, John Welz and Lee Helgans—on 6 kills each. Sands was awarded the medal, as each of the other three above named had wins to their credit and therefore were barred in to-day's contest. Gus Diem, for the second time, won the leather medal designed by himself as a trophy for low score. The full scores were:

C L Wissel (30)	1110111—6	J J Young (25)	0022220—4
John Welz (30)	2101111—6	J J Bermel (30)	1010002—3
Lee Helgans (30)	2220222—6	John Gardes (30)	0100101—3
William Sands (25)	1111021—6	Chas Zerweck (25)	0100010—2
Peter Eppig (30)	1111010—5	John Niederstein (25)	0001100—2
Ignatz Martin (30)	2110202—5	Gus Diem (25)	0001100—2
A J Newburger (25)	1101110—5		

The Annual Meeting.

The annual meeting was presided over by President Deckelmann, Secretary Newburger being also present. The treasurer's report showed $200 in the treasury and $100 of outstanding accounts easy of collection. Charles C. Wissel, who made the best record during the past season, was presented with a diamond badge, emblematic of the club championship; his record was 53 out of the 63 birds shot at in the nine club shoots. John Welz was second with 46 out of 56 shot at in eight shoots; he was presented with the "Wissel badge." Gus Diem was presented with his own leather medal, having won it twice during the season, and being the only one to accomplish that feat. The next shoot of the club will be in February, 1897.

NEW YORK GERMAN GUN CLUB.

Oct. 21.—Dr. Hudson was the hero of to-day's shoot of the New York German Gun Club at Dexter Park. The doctor had his eye with him, and never a bird escaped him until after he had scored 25 straight. The bird that did not count to him was the last bird he shot at, and it fell dead out of bounds.

In the club shoot at 8 live birds per man, all at 28yds., handicap allowance of points for yearly prizes, three men tied on 8 straight—Dr. G. V. Hudson, John Wellbrock and John Leopold. On the shoot-off, miss-and-out, Leopold dropped out in the fourth round; Hudson and Wellbrock kept it up until the latter let his eighth bird get away; Hudson having killed, won the badge for the monthly shoot. During the afternoon Wellbrock killed 20 out of 21 shot at. The scores in the club shoot were:

Dr G V Hudson	12112212—8	H Thomford	21201111—7
J Wellbrock	21211211—8	M Bondon	11210210—6
J Leopold	12121112—8	H Oehl	02022200—4
F Sauter	12021112—7	F Kronsberg	22100000—3
H Nebel	11110111—7	J Bissinger	00000002—1

Sweeps were shot as follows:

No. 1, 5 birds: Hudson, Sauter and Wellbrock, 5; Oehl and Nobel, 4, Kronsberg, Leopold and Bondon, 3; Bissinger 2.

No. 2, same thing: Sauter 5, Hudson 4, Kronsberg and Nobel, 3.

FOUNTAIN GUN CLUB.

Oct. 22.—The Fountain Gun Club, of Brooklyn, held its monthly live-bird shoot this afternoon at Dexter Park. The attendance was good, 14 members taking part in the club shoot, at 10 live birds, for the Brixey cup. Dr. Wynn and Louis Duryea tied for the cup on 9 each; instead of shooting off the tie, Duryea withdrew in favor of the veteran. The birds were an excellent lot, as good as any ever trapped on these grounds. Scores in the cup race:

L T Duryea (30)	2112022111—9	W R Brixey (28)	0221110021—7
Dr Wynn (30)	2111102211—9	A Crook (28)	0012101221—7
Wm Lair (30)	120211112•—8	J E Lake (28)	0000122221—6
Dr A Eddy (29)	0011111211—8	H McLaughlin (28)	2000120120—5
H Spratley (29)	2112100121—8	W R Allen (29)	0001011022—5
A Botty (29)	2022111022—8	Robt Grace (29)	0002011001—4
W R Selover (30)	0102110211—7	John Wye (28)	0110100020—4

Sweeps were shot as follows:

No. 1, 3 birds, $2, club handicap, one money: Wynn, Lair, Spratley, Allen and Brixey 3, Duryea, Selover, Botty and Crook 2, Grace 1.

No. 2, same thing: Wynn, Duryea and Lair 3, Botty and Brixey 2, Spratley and Crook 1.

No. 3, 3 birds, 32yds. rise: Wynn 3, Duryea 2.

ERIE GUN CLUB, OF BROOKLYN.

Oct. 22.—The monthly shoot of the Erie Gun Club, of Brooklyn, took place at Woodlawn, L. I., this afternoon. Ten members competed in the club event, which is at 7 live birds per man, handicap by classes. The scores made count in yearly averages for prizes. To-day's scores were:

Class A, 29yds. rise:

Harry Blackley	2222220—6	Fred Gref	•100202—3
Chas Detlefsen	1120110—5		

Class B, 28yds. rise:

Henry Muller	1112102—6	John Schmadecke	1100200—3
C H Luhrssen	021121•—5		

Class C, 27yds. rise:

Harry Jankowsky	1120100—4	M J Elsasser	100200•—2
Chas Nicoll	0210103—4	Wm Roberts	0100020—2

FALCON GUN CLUB OF BROOKLYN.

Oct. 23.—The monthly shoot of the Falcon Gun Club, of Brooklyn, held this afternoon at Dexter Park, was marked by some excellent shooting. Only four members of the club were present, but those four took part in the club event, which was at 10 live birds per man, and accounted for every one of the 40 birds shot at. Three made clean scores. J. N. Meyer being unlucky enough to lose his 9th bird dead out of bounds. In these club shoots a kill with the first barrel is counted as a point, a second barrel kill scoring ½. Bohling stood on the 25yds. mark, the others at 27yds. Scores:

				Points.
C M Meyer	11111	11111	10	10
John Moller	21111	11111	10	9½
John Bohling	11111	12112	10	9
J N Meyer	12111	111•1	9	8½

NEW UTRECHT GUN CLUB.

Oct. 24.—This was target day for the members of the New Utrecht Gun Club, but the attendance at the Dyker Meadow grounds of the club was only small. In addition to those who shot in the club races, the secretary, Dr. Pool, was on hand to run the shoots for the club. In the main event, the club shoot at 25 targets, known traps and angles, Donley Deacon was first in the A class with 20 out of the 25. Dr. O'Brien, the only C class man present, won in his class without a contest. In the contest for the Hegeman badge Platt Adams cinched his hold on the badge by securing another creditable win with 14 out of 15 at known traps and angles. His nearest opponent in point of wins for this badge, D. Deacon, could do no better than 9 out of 15. The strong northwest wind that blew all day caused the targets to fly very erratically, and made low scores the rule instead of the exception. Scores in the two main events were as below:

	Club shoot.	Hegeman badge.
D Deacon (A)	111111111110111111010101—20	101011101001101— 9
J Gaughen (A)	111010110111111101100111—19	111101011111111—18
P Adams (A)	110011110101110110111111—18	111111111111011—14
Dr Littlefield (A)	111011100001111000100011—14	001110w
M Van Brunt (A)	010010111011001111000101—13	111111101010011—11
Dr O'Brien (C)*	111010011101101100110101—16	10010w

* Class C men have an allowance of two extra targets in the Hegeman contest.

Other sweeps were shot as follows:

No. 1, 10 targets, unknown angles: Adams 9, Van Brunt 9, Gaughen 8.

No. 2, same: Adams 8, Van Brunt 8, Gaughen 8.

No. 3, 10 targets, reversed order: Gaughen 9, Adams 8, Van Brunt 8.

No. 4, 15 targets, unknown angles: Dr. Littlefield 12, Adams 10, Dr. O'Brien 9, Gaughen 8.

DURYEA USES ONE HAND.

Oct. 24.—Louis Duryea did some good one-handed shooting this afternoon at Dexter Park. The match was the outcome of some talk at the monthly shoot of the Fountain Gun Club, held at the same place on Thursday afternoon, Oct. 22. A match was made that afternoon for Duryea to shoot at 75 live birds, using one hand only, his score to go against the combined totals made by W. R. Selover, W. R. Brixey and Abel Crook, each of these men shooting at 25 birds, using both hands. This afternoon, Crook being unable to be present, Henry Spratley took his place on the team of three. All the men stood at the 28yds. mark. The match was an easy win for Duryea by 7 birds, with a total of 59 against 52. Duryea's total is by no means a low one for that style of shooting, but he has done much better work than that in the past. The scores were:

L T Duryea	12020211121111•1031102212—20
	2212012•2120212111211010—20
	2121202002212012l0•111111—19—59
W R Selover	1111021211200202020220121—18
W R Brixey	1210121201020111110011220—18
Henry Spratley	1211100021200111•10121100—16—52

PUBLISHERS' DEPARTMENT.

Hunting the Wild Goat.

THE white goat, or Rocky Mountain goat, as it is indiscriminately called, is a species of big game rarely hunted by sportsmen. This is not so much because of the difficulty of killing the animal, nor because of its actual rarity. It is a stupid animal, easily shot when once found. It is not, however, shot in the usual hunting grounds, as are bears, deer, elk, etc. It is remote from the common localities, but where found is in goodly numbers. It ranges very high up in the mountains—above the timber line, usually—among the rocks and cliffs. This requires great labor to get to it, but once there the hunter will get his game nine times out of ten.

If you care to read of a goat hunt made in the Bitter Root Range in Montana, in the fall of 1895, send 6 cents to Chas. S. Fee, General Passenger Agent, Northern Pacific R'y, St Paul, Minn., for "Wonderland, '96," which recounts such a hunting expedition.—*Adv.*

Florida and Western North Carolina.

THE climate is nearer perfection than that of any other place on earth. The time is fast approaching when numbers will desire to seek a milder climate. Where shall you go? The Southern Railway, "Piedmont Air Line," the great Southern trunk line, offers numerous attractive resorts located upon and reached by this great system of railways, all reached from New York in Pullman's finest vestibuled trains, giving all the comfort and conveniences that are required by the demand of the traveling public. If you are contemplating a trip and want descriptive literature or any information regarding the winter resorts South, call on or address General Eastern Office of the Southern Railway, 271 Broadway, New York.—*Adv.*

The Favorite Gun Cleaner.

THE "Favorite" Gun Cleaner, manufactured by the Bridgeport Gun Implement Company, is an extremely handy tool, used in connection with any B. G. I. cleaning rod.

It is adjustable by means of a set screw to fit any gauge from 8-gauge to 16-gauge, and is provided with broad blades of brass with sharp edges, which remove rust, lead caking, etc., without injury to the finest gun barrel.—*Adv.*

Could have Sold the Dog Many Times Over.

MR. J. H. BELL, treasurer of the Automatic Lifting Machine Co., of Boston, writes under date of Oct. 26: "Please discontinue my ad. for pointer dog ordered for one more insertion. I have already sold the dog, and the answers to ad. are coming in so as to bother me, showing well the merit of your paper as a medium."

ANSWERS TO CORRESPONDENTS.

J. D. B., New York.—1. When is the law off of quail in Union county, N. J.? 2. Also, is the 1892 model Winchester rifle—.44-40-200—heavy enough to give accurate shooting up to 125yds. with the above cartridge; I believe the rifle weighs 6¾lbs.? Ans. 1. Nov. 10. 2. Yes, the rifle is accurate for all ordinary hunting ranges.

A. M. D.—We do not publish in book form the series of papers on hunting without a gun.

The FOREST AND STREAM is put to press on Tuesdays. Correspondence intended for publication should reach us by Mondays and as much earlier as may be practicable.

THE WATER KILLING OF DEER.

THERE was not room to say all that was to be said, nor some things which should have been said, on this page last week; among others that the letter signed Deerslayer and defending the water killing of deer was printed for a purpose. That purpose was to put the plea on record as a deer hounder's own description of one phase of Adirondack deer hounding.

We have heard so much of the chivalry and the sportsmanlike qualities said to distinguish the practice of water killing deer as carried on in the North Woods that it is well worth while to have such a frank, if brutal, exposition as this letter affords of just what Adirondack hounding means as followed by one class of hunters. The description, it is true, does not differ essentially from others which have been given by critics of deer hounding, but the significant point of this communication of Deerslayer's is that it comes from a participant in the sport, an advocate and defender of it, who makes a plea in defense of his pet method, because he is apprehensive lest the Legislature shall interfere to prevent his further enjoyment of it. When those who are opposed to deer hounding have written of roping the swimming game and killing it with clubs or with firearms at close range they have been met with the answer that such statements were libels on true sportsmen deer hounders, and that the ropers and muzzle-end shooters belonged to a past generation. But here comes a man who admits all that the critics have said, who rejoices in those very methods whose practice has been so strenuously denied, and who upholds and defends such ways of securing the game.

The first essential to an intelligent discussion of Adirondack deer hounding from the standpoint of sportsmanship is an established basis of fact as to what deer hounding as there conducted actually is and what it involves. If the several parties to the discussion were to tell all they knew, it would probably be shown as to the facts that a certain proportion of deer killed by hounding are killed on land and under conditions which could be defended as fair and complying with accepted rules of sportsmanship; while the rest are killed in the water by strategems closely allied to those described by Deerslayer, and by methods which no one except, of course, the perpetrators of them would ever dream of defending as sportsmanlike. Moreover, we believe that it could be demonstrated beyond controversy that the horrible brutalities and outrageous cruelties incident to and inseparable from hounding are so many and so atrocious that, were game laws based upon the consideration of these facts, hounding should be prohibited. But the protective statutes take no cognizance of methods, save as to the relation of these to conserving the game supply. The law knows nothing of sportsmanship; it does not concern itself with the methods of wing-shooting versus potting on the ground, fly-fishing versus netting, water killing versus still-hunting. The statutes prohibit snaring game birds, not for the sentimental reason held by sportsmen that wing shooting is a better way of getting game than snaring it, bu for the purely economic reason that snaring cannot be permitted because, as demonstrated by experience, it exterminates the game. All the limitations prescribed by the game laws are in theory at least founded on this basis. The lawful seasons of shooting and fishing are designed to be so fixed as to insure that each species may have opportunity to rear its young to maturity; and the regulations which relate to liming streams, netting trout night shooting, use of big guns for wildfowl, killing moose in their yards, taking more than a specified amount of game or fish, sale, transportation and export—all these have the one purpose of so limiting pursuit that the stock may yet be perpetuated. And so it is with the law governing deer hunting. In almost all the States where the deer supply is recognized as a valuable resource to be preserved and continued, the use of hounds, or at least the practice of killing in the water, is strictly forbidden. It is forbidden on the ground that hounding is destructive to a degree in excess of the power of nature to make good. If a similar restriction shall be provided to apply to the Adirondacks, it will have a similar reason; and apart from maintaining the deer supply will not concern itself with the merits of deer hounding, The province of game laws does not include a determination of what is sportsmanlike and what is not. Apart from the economic considerations involved the statutes can have nothing to do with Deerslayer's approved method of noosing the game in the water and blowing its head off with "the good old 10-gauge gun with a charge of buckshot." The influences which restrain a man from that style of hunting should have been implanted while he was yet a child at his mother's knee, and fostered and developed and strengthened into a controlling force by all the surroundings of civilized society in this age of the world's progress when we are soon to write 1900.

THE ADIRONDACK BLUE LINE.

ONE gratifying feature of the discussion of the proposed amendment of the forestry section of the New York Constitution was the unanimity of the press in denouncing the proposition as unwise and iniquitous. If there was a single advocate of the measure among the exchanges which come to this office we failed to notice it. United and emphatic as was the press in opposition to the amendment, and thus reflecting as it did the public opinion of the citizens of the State at large, there was yet shown a prevailing want of information respecting the Forest Preserve and the Adirondack Park. These were commonly spoken of as identical, whereas they are distinct. The confusion thus fallen into was perhaps due to the text of the amendment, and it appears reasonable to assume that the author of that measure himself confounded the Preserve with the Park; his use of the term Forest Preserve would indicate as much.

The Forest Preserve is thus defined by the Constitution, Sec. 7 of Art. VII.:

"FOREST PRESERVE.—SEC. 7. The lands of the State, now owned or hereafter acquired, constituting the Forest Preserve as now fixed by law, shall be forever kept as wild forest lands. They shall not be leased, sold or exchanged, or be taken by any corporation, public or private; nor shall the timber thereon be sold, removed or destroyed."

The law fixing the Preserve being the act of 1885, as amended in 1893, and enforced at the time of the adoption of the Constitution, reads as follows:

100. FOREST PRESERVE.—The Forest Preserve shall include the lands now owned or hereafter acquired by the State within the counties of Clinton—except the towns of Altoona and Dannemora—Delaware, Essex, Franklin, Fulton, Hamilton, Herkimer, Lewis, Oneida, Saratoga, St. Lawrence, Warren, Washington, Greene, Ulster and Sullivan, except

1. Lands within the limits of any village or city, and
2. Lands—not wild lands—acquired by the State on foreclosure of mortgages made to the commissioners for loaning certain moneys of the United States, usually called United States Deposit Fund.

The Forest Preserve then includes all the wild lands in the counties designated. While the Constitution forbids the sale of such lands within the Preserve, it does not forbid the sale of lands outside of the Preserve; there was, therefore, no call for an amendment forbidding the sale of such outside lands; nor can we suggest any reasonable surmise as to the motive or intention of the proposed amendment, which with respect to this point reads:

The Legislature may also authorize the exchange of lands owned by the State situate outside the Forest Preserve, for lands not owned by the State situate within the Forest Preserve. The Legislature may also authorize the sale of lands belonging to the State situate outside the Forest Preserve. * * *

But there are no wild lands owned by the State situate outside of the Forest Preserve, for the law of 1893 and the Constitution declare all wild lands to be the Forest Preserve. Every plot of wild land, therefore, is included in the Forest Preserve and cannot be situate outside of it. An amendment authorizing the Legislature to sell wild lands owned by the State situate outside of the Forest Preserve would be an amendment empowering the sale of what does not exist, and nothing more can be made of such a proposition than that it is hocus-pocus, as we said last week.

The only lands situate within the Forest Preserve to which the amendment can refer are those tracts owned by private individuals and surrounded by tracts of State land. In many cases it is highly desirable that such tracts should be acquired by the State for the purpose of solidifying its holdings, but as there is now nothing in the Constitution forbidding the purchase of such lands by the State, no necessity exists of amending the Constitution to grant permission to make such purchase.

It is reasonable to assume that the intention of the author of the amendment was to provide for the exchange of lands within the Adirondack Park for public lands outside of the Park. The Adirondack Park is something entirely different from the Forest Preserve. It is a district set apart by the law of 1885, as amended in 1893, to include the territory thus described in the statute:

120. ADIRONDACK PARK.—All lands now owned or hereafter acquired by the State within the county of Hamilton, the towns of Newcomb, Minerva, Schroon, North Hudson, Keene, North, Elba, St. Armand and Wilmington, in the county of Essex; the towns of Harrietstown, Santa Clara, Altamont, Waverly and Brighton, in the county of Franklin; the town of Wilmurt, in the county of Herkimer; the towns of Hopkinton, Colton, Clifton and Fine, in the county of St. Lawrence; and in the towns of Johnsburgh, Stony Creek and Thurman, and the islands in Lake George, in the county of Warren, except such lands as may be sold as provided in this article, shall constitute the Adirondack Park. Such park shall be forever reserved, maintained, and cared for as a ground open for the use of all the people for their health and pleasure, and as forest lands necessary to the preservation of the headwaters of the chief rivers of the State and a future timber supply, and shall remain part of the Forest Preserve.

The Adirondack Park territory thus defined is marked on the official map of the Adirondacks by a blue line. The territory comprised within this line consists of parts of the Forest Preserve, that is to say, wild lands owned by the State, and of other land owned by individuals and corporations. The public possessions in the Park are broken up into numerous irregular and disjointed tracts separated by lands over which the State has no control. It would unquestionably be for the public interest if many of these private holdings could be added to the public lands; and the proposition has been advanced that advantageous exchanges might be made of State lands lying outside of the Adirondack Park (not outside the Forest Preserve) for private lands within the Park bounds. This probably was the intention of the author of the amendment; at all events, such a proposition would be intelligible, whereas no sense can be made of the amendment as printed.

But if the amendment had read that State lands outside of the Adirondack Park might be exchanged for private lands within the Park, even that proposition should be rejected; for the whole history of Adirondack public land transactions demonstrates that such deals are always engineered and put through with a sacrifice of the real interests of the public, and for the advantage of land speculators and lumbermen. To authorize Adirondack land exchanges and sales would be to open the way once more to jobs and betrayals of public interest. Under existing conditions the only sure way of keeping what we have in the North Woods is to maintain the safeguard afforded by the Constitution as it stands.

GAME SUPPLY FLUCTUATIONS.

IT is a noticeable fact in the evolution of the sports of field and stream that an over-abundance of a species of game depreciates or destroys its value either as a means of sport or as an article of food. Audubon recounts that in earlier days the prairie chicken was in such common abundance that no effort was required to secure it, so common indeed was it that it was considered unworthy of the value of the powder consumed in shooting it. This is a distinct contrast to the high esteem in which the bird is now held by the epicure, and the change shows that in matters pertaining to the palate and stomach prejudice or whim or education may be the dominant factor in determining what is best to eat. It was a long time before the terrapin gained fashionable approval and was thereafter considered a rare delicacy.

As an over-abundance will depreciate the value, so will a scarcity of a species of game enhance the value of it for sport or food. Scarcity multiplies the difficulties of pursuit and capture, and the obstacles to be overcome are the soul of all sports. They are what make skill, woodcraft and pleasure possible. They exact the highest and best physical and mental equipment of the individual for his best success.

As there may be too great an abundance for sport, so there may be too great a scarcity for reward of diligent effort, and yet the scarcity tends to broaden sport in a general sense, since the sportsman seeks other special fields, adding to what he already fancies; or, indeed, the new sport may have its own distinct and enthusiastic following. Rabbit hunting, for instance, which now is done largely with beagles, is a form of sport which a few years ago was considered largely as belonging to boys. It now has grown into the favor of men East and West, and has its conventional tenets of sportsmanship instead of the primitive methods of a few years ago.

Fox hunting too is growing in favor and gaining a broader field, so that sport is derived from it by constantly increasing numbers year by year.

And thus if one branch of sport is overcrowded to a degree which produces unsatisfactory results, or if there is a dearth of game material, it tends to the stimulation and development of other forms of sport, so that what may on the surface appear to be a particular loss may after all in a way be a general gain.

The Sportsman Tourist.

OLD HAUNTS IN NEW GUISE.

FROM the Vermont mainland in the township of Charlotte, a long cape, toothed with minor points and indented with small bays, reaches far westward toward the bald promontory of Split Rock. The cape is fringed with woods, and terminates in a bold cliff, crowned with cedars, pines and deciduous trees.

In it is embalmed the name of a man otherwise forgotten. No one knows who Thompson was, but it is probable that he was the first settler here, and that a scraggy orchard, intergrown with cedars, and the barely traceable foundations of a house, were his, and that some crumbling lines of stone wall mark the divisions of his sterile fields.

Doubtless the poverty of this soil prevented a succession of occupants and the consequent succession of names which so many of our points and bays have undergone. Thompson's Point is not a good name for a noble headland, but it is better that it should have borne it for a hundred years than half a dozen that are no more significant.

The Waubanakees called it Kozoapsqua, the "Long Rocky Point," and the noticeable cleft promontory opposite Sobapsqua, the "Pass through the Rock," names which might well have been retained, and perhaps would have been if our pioneer ancestors had not so bitterly hated the Indians and all that pertained to them. There was cause enough for this hatred, but one wishes it had not been carried so far when the poverty of our ancestors' nomenclature is considered, and the few surviving names of Indian origin remind us how easily we might have been spared the iteration of commonplace and vulgar names that cling to mountain, river and lake.

Sobapsqua and Kozoapsqua make the gateway to the broader expanse of water stretching thence to Canada. It is one through which many memorable expeditions have passed—unrecorded war parties of Iroquois and Waubanakee, the brave and devout Champlain on his voyage of discovery with his Indian allies, the predatory bands of French and Indians marching over the ice-bound lake, the armies of France bearing her banners to victory or trailing them homeward from defeat. Here passed Rogers and his rangers to wreak vengeance on those scourges of New England, the Waubanakees of St. Francis, and then Amherst's army passing from lesser conquests to the final and crowning victory. A few years later the little army of Americans went through these portals to its disastrous campaign in Canada, and the ensuing winter saw Warner and his rangers march down the frozen lake to the succor of their hard-pressed brethren; the summer, the same brave commander bearing homeward the feeble remnant of the Northern army.

Here Arnold's flotilla passed on its way to the bloody battle at Valcour, and here the escaping vessels were overtaken by Carleton's fleet and the running fight began which ended at Arnold's Bay. Through this broad gateway came Burgoyne's unreturning host. Ticonderoga fell, and henceforth till the close of the war British warships passed and repassed in undisputed possession of the ake whose waters mirrored no flag but the red cross of England. Then it vanished from them till it reappeared when Captain Pring's flotilla made its unsuccessful assault on Fort Casin, at the mouth of the Otter, in which McDonough's unready fleet lay moored. Next day the stars and stripes flashed past these headlands as the gallant fleet sailed down the lake to its eventual glorious victory in Plattsburgh Bay.

Thus, for two centuries, such shifting scenes of war passed in broken succession before these steadfast sentinels. Then came the peaceful sails of commerce, white-winged schooners and sloops, the single square canvas of Canadian craft; immense lumber rafts, coaxed slowly northward by sweep and sail; the first clumsy steamboat, making tortoise-like progress, followed in a little while by majestic successors, tearing the still waters asunder and casting the torn waves against either rocky shore.

In the later, pleasant days of autumn canoes of the Waubanakees reappeared, like apparitions of the old days, rounding the ancient headland, and making into the great "Bay of the Vessels" straight for Wonakakatukese, Sungahneetuk or Paumbowk, the old trapping grounds of the wild fathers of these peaceable men, coming now with no bloodier intent than warfare against the musk-rats, while their women made baskets and moccasins to hawk about the country side. The oldest men could repeat the legends of ancient wars with the Iroquois and knew the old names of rivers, mountains and lakes, and still made offering to Wojahose, the invisible deity of the lake, as they paddled in awed silence past the lonely rock wherein dwelt the master of storms.

Fifty years ago some one discovered that the reefs off Thompson's Point were good fishing ground for pike perch, and they became a favorite resort of anglers. To take advantage of the late and early fishing it was a common custom to camp on the Point over night. For the most part the fishermen camped in primitive fashion. They slept on beds of cedar twigs under rude shelters of cedar boughs and cooked their simple fare, with few utensils, over an open fire. Occasionally a party brought a tent and lived more luxuriously under canvas during a longer outing. At last a goodly guild of honest anglers built an unpretentious but comfortable club house with two rooms on the ground floor, one of which was kitchen, dining room and living room, the other a sleeping apartment fitted up with two tiers of bunks, which were supplemented by others in the loft. There were a cook stove, a big coffee-pot, kettles, and more than one capacious frying-pan, also a table and seats, but the primitive character of a genuine camp was still maintained. Everything was conducted in a free and easy manner, without any attempt at style or luxurious living.

To supply the demands of the frying-pans and for sport, which, though dull as watching a runway for deer, quite satisfied their modest desires, these men anchored their boats on the reefs and fished from daybreak to nightfall with the philosophical patience of honest anglers. When the fish were biting well there was lively work hauling in the 60 or 100ft. of line hand over hand, with a stout pike perch and a strong current to fight against, but when there was a long time between bites it was dull enough. A stiff cedar pole with wire guides and a cleat at the butt to wind the line on was the approved tackle by which the fish was brought to boat in the briefest possible time.

If the fishing was not conducted in the finest style of the art it fulfilled all the requirements of these anglers, and there were jolly gatherings around the camp-fire, whether it blazed in the free air or roared within the rusty iron walls of the stove.

In those days the Point afforded good fox hunting, as in days long before, when Uncle Bill Williams and the old Meaches hunted there with their gaunt, melodious-voiced, old-fashioned hounds and were succeeded by Uncle Bill's son's, John Thorpe and others of a generation of Nimrods, who, in turn, have departed to happier hunting grounds than these are now.

We who came later had excellent sport, for at least one litter of foxes was sure to be raised there every year, and besides these residents transient visitors were likely enough to be started.

A fox running before hounds would keep a course conforming to the shore line and thus make the circuit of the Point, crossing from one side to the other near the heads of the two bays, and so repeated the circuit till killed, run to earth or run off the Point along one or the other shore to the Cove Woods, McNiell's Point or the hills. A single hunter stood a reasonable chance of getting a shot, while if there were two or more, properly posted, one of these was almost sure of a chance, though by no means so certain of the fox, who sometimes safely ran the gauntlet of half a dozen guns and left as many chopfallen hunters, each excusing himself and blaming the others.

I have painful recollections of being more than once a member of such an awkward squad, mingled with pleasanter memories of occasions when fortune favored us; but somehow the misadventures stand forth most prominently. I well remember one dull-skied November day when I tramped to the Point with no companion but my old hound Gabriel, and ranged the woods almost to the end without finding a track till he came to the old orchard, I being a little behind him, when he sounded such a melodious blast of his trumpet as at once raised my waning hopes and set me all alert. In a moment he had a fox afoot and going around the end of the Point from the south side to the north at a lively rate. There was a bare chance of my getting over to that side in time to intercept him, and I tried my best for it, running *ventre a terre* beside an old wall that crossed the pasture till I came to the belt of woods above the shore. I had not time to catch breath before the fox was seen among the thick shadows of the trees, in black relief against the light beyond, and I made a snap shot at him. He tumbled all in a heap into a clump of cedar trunks, but before I could get to him he picked himself up and staggered into a thicket, whither I followed close at his heels and making futile snatches at his brush, a foot or so beyond my reach. Having the advantage of slipping through intricacies that I floundered against, he was gaining on me a little, when Gabriel overhauled us and pounced upon him with a grip that took the life out of the poor fox, yet not soon enough to prevent one vengeful nip in the nose of his slayer. Gabriel's angelic name came of his voice, not of his temper, which was so kindled by this last thrust of his foe that the handsome skin was in danger of being spoiled before I could get the fox away from him. When I began taking off the pelt he curled himself up for a comfortable nap, but a fresh twinge of his wounded nose suddenly rekindled his smouldering wrath, and snatching the fox out of my hands he gave it another violent shaking, and I had to be severe with him before he would let me finish.

This done, we set forth in the homeward direction along the belt of woods on the north shore. We had not gone far before Gabriel found a track that engaged his earnest attention, whereof he made loud proclamation while it led him across the wide pasture to the woods of Cedar Point, which is the southernmost headland of the cape and the largest piece of woods upon it. In a moment the woods were filled with quick reverberations of the hound's melodious voice. Assured that the fox was afoot and that there was no time to lose, I put my best foot forward for the corner of a fence which ran across nearly to the woods and divided the pasture from a meadow. The desired point was scarcely reached when I saw the fox break cover, a tawny dot in the woodside, now growing and growing into distinctive form as it rapidly drew nearer along a cowpath that ran close beside the fence. Now he was not more than two gunshots from me, the butt of the gun was at my shoulder, my finger touching the trigger, and I could almost feel this fellow's pelt in my right pocket comfortably balancing the one in my left, when a herd of young cattle discovered him and charging in a mad stampede drove him through the fence into the meadow, across which he took a diagonal course, well out of my range. I fired with a forlorn hope of crippling him, but only increased the velocity of the ruddy streak which vanished in an instant and left the world a blank.

Presently the leaden sky came closer to the earth, and then became one with it in a dense snowfall, and muffled in its thick veil Gabriel's trumpet notes sounded faintly far away, as he pottered over the blotted scent. The six miles tramp home was leg-wearying, as all can testify who have taken so long a walk in the first snow, but my luck had been good enough and I should have been satisfied, yet the vanishing form of that fox stood forth then as it stands even now in unpleasant distinctness, clearer than aught else in the day's events.

Immense flocks of ducks used to cruise along the shores and come out on the shelving rocks, sometimes in very dangerous places, where ambushed gunners lay in wait to rake the huddled throng with a charge of BB shot. In some cases a dozen or more were killed by a single discharge. Frank Brady got eighteen with two barrels. Old Justin Cyr killed as many with one discharge of his ancient Queen's arm. This was very unsportsmanlike, and in nowise to be compared with the exploits of men who kill a hundred ducks on the wing in a day's shooting and are still unsatisfied. Our pot-hunters fired but one shot and went home quite content with the result, and from year to year there was no noticeable decrease in the numbers of water fowl till the generation of "true sportsmen" with improved weapons began to increase and multiply.

It is not to be denied that there is a degree of excitement in the stealthy approach to a flock of wary dusky ducks, or in lying in wait, silent and motionless, for them to swim within range, meanwhile observing the autumnal beauty of earth and sky out of the corners of one's eyes, sniffing the fragrant odor of ripe leaves and listening to the pulse of lazy ripples, and undeniably there is a satisfaction in the successful shot. Nevertheless it was pot-hunting that one should blush with shame for having indulged in, yet somehow I do not, only as the recollection of some inexcusably bad shot comes back to me.

I am glad I do not know how a man feels after shooting 100 ducks that have flown past his stand or stooped to his decoys in one day. It seems to me that one should feel remorse rather than exultation for such a feat.

The beautiful island in the north bay which was called Birch Island when I first knew it, clad then with a thick growth of white birch and cedar, was a beloved resort of ducks, and its secluded shores were seldom disturbed by gunners. By change of ownership its name became Yale's, then Holmes's, and is now Putnam's after the present owner, who has a handsome summer house there and has so improved the place that the wild ducks have forsaken it.

I think this may be the place where the devoted missionary, Isaac Jogues, ran the gauntlet and suffered other tortures from his savage captors while he and his fellow captives were being carried to the Mohawk country, for though by no means situated on the southern part of the lake, it is the southernmost island which answers at all the description given of the halting place of the war party, by Parkman, in his "The Jesuits in North America":

"On the eighth day they learned that a large Iroquois war party, on their way to Canada, were near at hand; and they soon approached their camp, on a small island near the southern end of Lake Champlain. The warriors, 200 in number, saluted their victorious countrymen with volleys from their guns; then, armed with clubs and thorny sticks, ranged themselves in two lines, between which the captives were compelled to pass up the side of a rocky hill. On the way they were beaten with such fury that Jogues, who was last in the line, fell powerless, drenched in blood and half dead. As the chief man among the French captives, he fared the worst. His hands were again mangled, and fired applied to his body; while the Huron chief, Eustache, was subjected to tortures even more atrocious. When, at night, the exhausted sufferers tried to rest, the young warriors came to lacerate their wounds and pull out their hair and beards."

One can hardly realize that scenes now so steeped in the serenity of peace should ever have witnessed such barbarities.

The shores of this island can no longer tempt me, as they once did years and years ago, to steal a boat wherewith to get close to the congregation of ducks assembled in and about them on that October Sunday. My companion and I broke two commandments and were not penitent, but I trust heaven forgave us, for we were only boys and returned the boat just as we found it, and got nine lusty, dusky ducks, half as big as geese.

John Hough, an old man whose memory ran back to the last days of deer hunting here, told me that the deer, started on Mt. Philo, used to run to water at Thompson's Point, as the lay of the land would lead one to guess.

Here the relentless slayers of the last deer lay in wait for their prey, while, faint and far away, the hound's first notes drifting down the wind-blown crest of Mt. Philo, then swelling to a jangle of echoes in the nearer woods, the hunted deer plunged into the lake and the rifle spat out its spiteful charge, or the long smooth-bore belched forth its double charge of ball and buckshot, and the rocky steeps of Sobapsqua, offering life and safety, faded out of the glazing eyes.

The days of the deer were long ago when the Point was still a half wilderness, and the days of the fox and the wild duck are almost fallen into the past, for the place has become a fashionable resort, and is populous with deluded people who imagine themselves to be camping out. In fact, they live luxuriously in furnished cottages, with carpets on their floors and cushioned chairs, and have dinners of divers courses, with napery of fine linen and service of choice ware. I am told that they not only undress to go to bed at night, but that the women folk actually change their elegant apparel two or three times during the day. Poor souls! little they know of the freedom of real camp life, the comfort of one shabby suit that does service day and night, the disenthrallment from the care of tableware, and the cleansing of many utensils from over-neatness and punctilious etiquette, but yet not from true politeness.

Scaffolded on mattressed bedsteads over carpeted floors, how shall they so much as guess what restful sleep comes to him who lies close to the bosom of mother earth, with naught between but a blanket and a litter of fragrant cedar twigs. What poor comradeship must there be among those who gather around a black stove, compared with such as encircle the genial blaze of a camp-fire, and how shall those feel themselves near to nature who are shut from the sky and the woods by wooden walls and roofs?

The best of camp-life is in escaping from the wearisome burdens of civilization and in some measure renewing the old relationship with nature.

The change has been even greater on the other side of the north bay at Cedar Beach, which has undergone a change of name as well as of character since the time when we followed fugitive foxes from Thompson's Point thither, or made fresh starts among the vulpine residents of its wild seclusion. It was known as McNiell's Point then, after its pioneer owner, who established a ferry just north of it, which was continued by his descendants with various craft—sloops, horse boats and a natty little steamboat. It was a famous thoroughfare until the building of the railroad, which revolutionized everything. Then there were no more great droves of cattle making leisurely progress toward Boston on the hoof, nor any longer much faring to and fro across the ferry on the business of traffic or visiting, and the idle ferryman and the guestless publican lounged on the rotting wharf in mutual condolence.

Yet the little wilderness on the Point, seldom invaded by human kind except the infrequent woodman, the more infrequent meditative woods lounger and the hunter, and throbbing in springtime with the beat of the partridge's drum, ringing all summer long with the songs of a multitude of birds, echoing in the golden days of autumn with the melody of hounds, still preserved its sylvan seclusion and kept its homely name, till it was discovered by some "hey duc" explorers, who rechristened it and made it fashionable.

Spick and span cottages, even elegant residences, are built upon its heights; a steamer comes to it regularly twice a day during the summer, and the thronged woods are noisy with gay pleasure-seekers.

It is all spoiled for us old-fashioned camp dwellers, but no more perhaps than our barbarous modes would spoil it for these dainty folk. I can imagine how their sensibilities would be shocked at the sight of our uncouth living, our lairs of boughs and blankets, our unnapered table, with the frying-pan serving for platter and common plate, no less than our sense of the fitness of things is hurt by this flaunting of fashion in the face of nature.

They wonder at our ways, we at theirs, being unable to understand what they can find in all that they enjoy to compensate for what we have lost—the freedom from care and conventionalities that were ours in these wild corners, when the click of the croquet ball, the incongruous jingle of pianos and the babble of human voices did not overbear the whispers of the wind in the trees, the songs of birds and the soft laps of waves on quiet shores.

ROWLAND E. ROBINSON.

IN SAVAGE WILDS.

CIMARRON, Kan.—Dear reader, I want you to go with me in spirit to the banks of an almost unknown cañon near the Rocky Mountains. I want you to smell the soft, health-giving odor of the pinon and cedar in those rocky wilds; to sit in a nook and look down half a mile at what looks like a little brook at the bottom of that tremendous cañon; to feel the soft kiss and life-giving warmth of the glowing sun; to see the gray buck as he springs from his bed and, bounding off a few jumps as elastic as a rubber ball, pauses and looks back to snort defiance at his enemy, the dim, grass-colored hunter; to see the lordly old wild turkey, his feathers glistening in the rising sun like bronze armor, as he struts on his roosting limb and gobbles till the gloomy cañons ring again, and there from afar comes like an echo the distant notes of more than one rival, showing that you and I are rich in our heritage yet of God's best gifts to man. Yes, my friend, it's 1896 and they are not all gone yet, and will last our time. My boy can hunt in South America in years to come if all my old places are barren, so I don't despond even for him. There—I've taken a pretty big contract when I endeavor to make you see all that I have written of, but I'll try to fill it.

Every fall I grow uneasy. I sometimes try to fight it off—for I can't afford to lose a month from my business—but it steals over me more and more strongly, till I find ice on the pools in the morning and the old gray geese go calling away up in the sky like a pack of spirit hounds; and I can't stand it any longer. I must go. I must sleep on the ground. I must fry meat over an open fire. I must see my sheep (the deer) again.

It was November. My old hunting buggy—commonly called "Dick's mud wagon"—was thoroughly overhauled and repaired. Nothing short of a cyclone could faze it, so the blacksmith said. My .45-90 Winchester was resighted with Freund's sights, and I had made three shots into a dollar with it at 100yds. The tent is overhauled and mended. The horses are reshod. They are smooth and fat, and the spirit of mischief gleams from their eyes as they look at me when I step into the stable. My twelve-year-old boy looks at me with dreamy, retrospective eyes, and is so contented he doesn't talk much; for he is going too. He loves to hunt really better than I do; and it does me good to see how handy he is with a gun, and how he can dress game; to see him crawl like a cat when in pursuit of it, and how he gets there every time. God bless him! he will hunt many a lovely day when I am at rest.

Nov. 10 we started from Cimarron by buggy for a 300 mile drive to Miguel's ranch on Rita Azul—southwest over the sandhills and over miles and miles of prairie, arid, dun-colored and cold. The horses are kept at a steady jog trot. Willie lay awake pretty much all last night, he was so excited; and now he has curled down in a nest of blankets and sleeps, warm and cozy as a kitten, while the ponies tug at the bits and try to go faster all the time as we roll gayly along over the smooth hard road. At noon we stopped, and I took the bridles off the horses and had turned them loose to drink. We camped near a pool on the prairie, and while they cropped the sweet, crisp curly buffalo grass, I made coffee and warmed up some roast chicken from provision box No. 1, which is for the road. Will woke up when he heard the coffee-mill, and stretching out his head like a squirrel from his hole, inquired, "Where are we, father?"

"Thirty miles from Cimarron and nowhere in particular is all I can tell you, Will. Get out and fetch me some bread, the butter and some pickles, and we will eat dinner."

"That's real good chicken," said Will after he had eaten about half a big one. "Mother's an awful good cook, but I had rather eat deer meat and kill it myself."

After dinner Willie fed the horses a few oats while I washed up the dishes, and we started again. Will took his Winchester (a .44cal., model of '73) out of its case and looked at it lovingly. He had never killed anything but jack rabbits with it; and a shade passed over his face. "I'm afraid I can't kill deer with this."

"Don't worry, Will. You can and will kill a deer within two weeks with that gun. I have killed a carload with one just like it when I was a cowboy."

"Were you a real cowboy, father?"

"Yes, I think I was. I owned a stock of cattle for seven years, and was so successful with them that my Texan neighbors did not always love me as warmly as they might, if they had wanted to. We are going now straight to my old stamping ground, and I'll tell you a story every night after I get there of what we used to do."

And we trotted on till almost dark, and arrived at one of the most woebegone-looking little Kansas prairie towns that I ever had the misfortune to see. The little cluster of houses looked as if they had strayed off and got lost out there, and yet it had a kind of a don't-care-a-cent look about it after all, as if it wasn't much afraid to be out there all alone. Its name is Santa Fe.

We drove in and put our buggy in the stable, and then Willie and I carried our guns over to the hotel and also two pairs of blankets, for these frontier hotels are generally scarce of bed covers. Then we went back and covered the wagon sheet over the buggy and load, and tied it down tight so as to discourage inquisitive strangers. When we got back to the hotel supper was ready, and a wretchedly poor one too for a hungry man and boy; but Bill didn't grumble, and I was ashamed to. But the landlord was a gentleman, and owned up like a little man that the supper was poor. He said that we should have a better breakfast or that he would kill the cook. I told him not to do that, for I didn't believe that he would be good to eat if he did, for he looked thin and tough. Bill inquired of me privately, after we went to bed, about the cook. If that man killed the cook wouldn't they do anything to him out here, or was it too far from court? I explained to him that the landlord was only joking, and Bill seemed disappointed.

We went to bed early and I didn't sleep much; the bed was hard and nubbley. The wind rose soon after dark and the old barn of a house rocked and pitched and creaked like a ship at sea. I was nervous and longed to get up; but there was no stove in the room and I hated to go down-stairs and thump around in the office, so I lay and squirmed till toward morning, while Willie slept like a kitten. Finally I dozed off and Will woke me up, saying: "That man wants us to come to breakfast, and says he has got the best of that cook this time. Let's go down and see what he has done to him."

We found a nice breakfast awaiting us cooked by a master hand: Ham omelet, Saratoga chips, milk toast, stewed dried beef on toast and good strong coffee. "How did you make him cook like this?" I wonderingly inquired of the landlord, who beamed upon us coffee pot in hand. "Oh, I fixed him. I let him sleep and cooked this myself." I love that landlord. He is a good cook and a gentleman, and when he charged me $2 a few minutes later I told him that his breakfast alone was worth that. He looked at me candidly and said: "I wish I had charged you more, but I thought you would kick at $2." He gave me a cigar that I lit and almost immediately threw away, for it was not nice.

In ten minutes more we were rolling along toward the West. Another day over almost barren prairie, and we camped in a roofless sod house and drank water from a water hole. It was Will's first night in camp. We put up the tent inside the house and cooked a nice supper; and as he looked around at our cozy quarters he said that he didn't want to stop in hotels any more this trip.

We slept soundly, and it was late next morning when we started and drove southwest. Just before we reached the head of Two Butte Creek, Will called my attention to six objects about two miles ahead. Stopping and looking at them with the field glass, we saw that they were antelope. They were on a side hill sloping toward the east, near the trail that we were driving on.

The wind was blowing straight from us to them, and though I could have got a shot by driving straight for them, for an antelope won't run down wind when you scare him, yet Will was not strong enough to hold the horses after I had got them excited by running, so I had to employ different tactics. I drove south about two miles, and then drove west down into Two Butte Creek Valley, then north till I reached the trail. I knew that we were then west of the antelope and not over a mile from them. We picketed out the horses, which were steaming from their fast six-mile drive, unskinned the rifles, put on our leather pants to crawl on, and away we went. Will was trembling with excitement, and looked as if he was scared. I told him to crawl beside me 6ft. away, and shoot as soon as he saw the game, if they were within 200yds.; to aim sure and not to mind me.

We crawled to the top of the ridge, and there they were, about 150yds. away. Will shot the nearest, but too low, and I shot her as she gathered to run, and then I stopped, for I didn't want to carry much game on the road. I might have killed more, but what was the use? We ran to the doe, who was stone dead when we reached her—shot through the brisket by Will, and both shoulders smashed by my .45-90 ball. "I can hit them, can't I, papa? said Will, as he looked at the pretty two-year-old with glowing eyes. "I would have hit her if you hadn't shot, don't you believe so?" And I told him yes, and truthfully; for his first shot was a good one.

Will packed the guns and I the antelope to the buggy, and when I got there it felt as if it weighed 250lbs. We hitched up and drove to water, and soon you could have smelt the savory odor of fat antelope ribs as they sputtered over the fire. They smell even better than they taste.

That night we camped at Milligan's sheep ranch on Freeze-out Creek. No one was there, and the house had a board over the door with the following legend:

"BEwaIr oF sMaL pOx."

I am satisfied that it was a bluff, but I didn't want to camp in the house, and we passed a comfortable night in our tent. At daybreak we were on the move for the last day's drive, and with only a short stop at noon at last passed a little Mexican plaza, where more than one gave a Comanche yell of recognition as they saw me. Two miles from there we approached the foot of the Raton Mountains, went over the last ridge, and then Miguel's house was in sight. It looks like a big mud-wasp's nest. Luis, his son, came out and darted back into the house when we were yet a mile away, and I saw the gleam of the field glasses as Miguel inspected me. They both came out and as I drove up Miguel smiled a broad smile. He said, "By the grace of God, I am contented to see you once more. The deer are fat and plenty. The horses are doing well. Many colts."

Then Luis saw the antelope, and Willie said: "I killed that!" and from that time on the boys had a time. Will couldn't talk Mexican, and Luis, a boy of sixteen, small for his age, couldn't talk English; but they could understand each other somehow, generally; and when they didn't Miguel or I had to interpret. Before I fairly had the horses unhitched Will had got a long box out of the load and extracted a .44cal. Winchester for Luis, and the boy had got it in his hands and looked at it as if in a dream. Will took a belt full of cartridges from the gun box and Luis put it on—I never saw him without it in his waking hours. "The gun and belt are yours, Luis, and you and Will can hunt together when you please." I told Will what I had said, and those ridiculous boys got up ponies and started at once for the hills. As they rode away I told Luis to get in by dark, and they came back in about two hours and both talking at once. Will informed me that he could outshoot Luis. They had gone off into a valley up in the hills and shot at a mark most of the time.

Inez, Miguel's mother-in-law, cooked us a fancy supper of broiled antelope and eggs with chili, and we settled down for the night.

The next day we branded colts and straightened up our business affairs. Then commenced preparations for a camp hunt into the Trinchara Pochet, a piece of country that lies straight south of Las Animas, and which it is hard to beat as a game country, but is very r ugh. The next day we struck out—I with my buggy, and Miguel, Will and Luis on horseback. Twenty-five miles north landed us on the east bank of the Purgatoire Cañon, in a little valley near a beautiful spring. Not a soul lived within twenty-five miles, and the game is tame, comparatively speaking.

The horses were fed and picketed with long ropes on good grass, the tent was up and supper was soon going. We ate at once, and then all started for a little evening hunt, Will and I together, for he is a little fellow and I feel somewhat like a hen with one chicken when I have him out. We were on the high land on the east bank of the Purgatoire Cañon. The country is rolling and park-like; there is timber in clumps, then a little prairie, then a hollow with a fringe of timber on each side of it, and so on. We went south and sneaked up-wind through the scanty timber like ghosts. Both wore rubbers. When we came to the fringe of timber on the edge of the hollow a big buck rose up quietly on the other side and walked behind a cedar tree. We were only 50yds. from him, but we couldn't see him. I sat down and told Will to sit and get ready. I could hear Will quiver with excitement, but I dared not look at him, for I feared that the buck would break cover on the jump, and I meant to get him if I could. But no; he at last got curious and stepped out in full sight, turned breast toward us, and looked at us with his head on one side out of one eye; and William shot him twice in the sticking place and once through the nose before he could fall down, and then he turned flipflops like a big rabbit, and the main thing I had come to Colorado for was accomplished. Will wanted to shoot him some more, but I stopped him with "Don't shoot, Will, you have killed him," and we went down and I let Will bleed him; and Will crowed and talked like a mill-race. I left Will to guard the game and I went to camp, got the buggy and went back to the deer. It was a big lift to get him into the buggy; but I finally got him in and we went to camp. Miguel had got in with Luis. They had some rabbits which they were frying, and we ate another supper. They had killed another deer.

The next morning the boys went hunting and saw deer, but didn't get any; and Luis promised the Virgin Mary 2½lbs. of candles of good quality and not to cost less than 50 cents if she would let Will and him kill two deer apiece that morning. Miguel told me privately that he didn't believe the Virgin could or would do such a big thing so cheap.

Will went with me at 3:30 P. M. and we saw several deer, but didn't get a shot, and I came to camp and made a canned peach pie and fried 8lbs. of Miguel's doe; and then Miguel came in and they had another deer that Luis had shot. He said that he was a boy of his word and would burn 15 cents' worth of candles in honor of the Virgin when he got home. Which he did; and I played casino with Miguel by the light of them.

We started for home the next morning and got there with steaming horses before noon.

The day after we got back to the ranch I concluded to go over into the Cimarron Cañon, a distance of about ten miles, and get some buckskins, which I had heard that a Mexican had got together by purchase, barter and otherwise. Will preferred to stay at the ranch and go turkey hunting with Luis. Miguel stayed at home to go with the boys and take care of them, and I struck out alone with the buggy and my ponies. I found my man all right, and bought 64lbs. of buckskins, well tanned and smoked, for a three-year-old horse and $14; loaded them into the buggy and started back. As I was driving slowly past a Mexican house on my return a woman came to the door and looked out. It was a white woman and I thought I knew her. I stopped, got out and walked up to her. "How do you do, Mrs. Wagner?"

She drew herself up and said: "My name is not Wagner and I don't know you."

"Didn't you cook for me in Cimarron four years ago?"

"No, sir, my name is Jones and I am from Missouri." And she turned and walked into the house.

I got back into the buggy and rode off, and found out that I was mistaken and that the woman was named Jones; but it was a disappointment, for I know of over $700,000 that is waiting for Mrs. Carrie Wagner, formerly of New York State, who came to Kansas about eight years ago and cooked for me. She disappeared or rather went away, and I could never hear of her whereabouts or her heirs since. Well, this world is a large one, and we may get lost ourselves some day. But it was she, I think.

Miguel and the boys were gone when I got in and Inez fed me chili and beans and a great, thick, juicy broiled venison chop broiled over live coals. It was getting dark and she made a curious figure as she sat looking into the open fire. Her seat was a sheepskin on the floor, and she tore the broiled meat from a deer rib with strong white teeth and looked into the fire with wicked, bright, black eyes, seeming to forget that she was not alone. "What are you thinking of, Inez?"

"Of the boys. I can feel that they are almost here and they have game."

In a few minutes, sure enough, in they came with two big old gobblers, and both of them talking at once, Luis to his grandmother, who looked at him proudly, Will to me. "You ought to have been with us to-day; we had such a good time. It smells so good up in the cañon in the pines, and we saw two flocks of turkeys. Luis killed his out of the first flock and I got mine at the roost after dark. Isn't he a beauty?" And he was indeed. We weighed him at once and he pulled down 24½lbs. Luis's bird weighed 20lbs. flat. Miguel soon came in and they made the beans and meat suffer. I think my boy Bill is hollow clean down to his toes. Luis had used my Winchester shotgun after the turkeys, but said that he preferred his rifle.

Soon we were all settled for the night, every one asleep but me, and I dropped off too.

Well, we hunted more, and at last telegrams found me and I had to go home, and the road was long, and I drove fast; and at last I saw my wife in the door, and the other children were glad to see me, and I put on the derby hat and the chain harness of civilization and took up the burden of life once more. *Au revoir. Hasta la manana.*

W. J. DIXON.

IN THE CASCADES.—II.

The Waldo Lake Country.

(*Continued from page 343.*)

CHRISTY had made previous arrangements by letter for pack horses; but "the best laid schemes o' mice an' men gang aft a-gley," and in this particular instance Christy's scheme for pack horses went sadly a-gley. The man with whom he had contracted lived six or seven miles up or down the Santiam. It mattered little to us whether he lived up or down or at all, for the horses did not materialize and Christy was correspondingly mad. Mears took advantage of the opportunity, of course, to even up with Christy on some previous proposition, and caustic and unseemly remarks were freely indulged in by both. The natives all looked for a scrap, but they didn't know the boys as well as Mead and I did, and when Christy commenced to air his literary attainments by quoting from some old author, "Be it your unerring rule ne'er to contradict a fool," and Mears had responded, Mead closed the argument by cocking his gun.

Horses we must have, and Christy, as usual, was equal to the occasion. Luckily he soon found a skookum young fellow by the name of Ed Myers who had a fine brown mare, and he in turn found a little roan cayuse about as big and about as useful as a goat; the packs were adjusted, and we were soon on our way to Waldo Lake. Myers accompanied us to look after the horses and the packing. He had never seen the lake, and he probably wishes now that he had never been induced to go. I have been through and through the Black Hills, pretty thoroughly investigated the Rockies, camped for weeks in the Coast Range, hunted and fished for many years in various parts of the Cascades, but in all my experience I have never before seen such a trail to take pack horses over as the upper part of the trail into the Waldo Lake country. A man or set of men that would take a horse over that trail, knowing its character, ought to be prosecuted for cruelty to animals, and I hereby tender my gratuitous services to the prosecution. Fox told us to go by way of the hot springs. He said it was a little longer trail, but that we would gain by it, and besides he didn't think it possible to get a horse in by the shorter trail. But Christy had decided to go in by the shorter trail, and, as Mead put it, he would go in that way even if he had to carry the horse in on his back, while Mears declared that such obstinacy and perverseness ought to be punished in some way that would not involve the innocent.

The first part of the trail over to and along the Brightenbush was more than an ordinarily rough mountain trail, but Christy's only answer to our unfavorable comments was: "Boys, this is a sidewalk compared with the P. Warmer above Stink Creek." This was encouraging to fellows already dripping with perspiration when they were not shivering with fear. We took those horses along precipitous trails, where I would not want goats to go if they were worth more than a nickel a head. Stink Creek! P. Warmer! Euphonious names surely, and evidently founded on fact, and we kept wondering what the facts were. But an all-wise Providence had decreed that we should remain in blissful ignorance of Stink Creek and the P. Warmer for that day. All that day we traveled up the Brightenbush, sometimes along the stream through the finest timber I ever saw, except at the head of Deep Creek in the Coast Range; sometimes along shelving walls so far above the stream that we could hardly hear its roar; and sometimes, well, somewhere in ethereal space between earth and moon. Christy had announced the previous evening that by taking this shorter route we would get through in one day. Doubtless it was a case of the wish being father to the thought. At any rate, night overtook us just as we reached the mouth of Stink Creek, and we camped right in the deep forest. An acre of that timber standing in Iowa would make any man rich.

The only serious trouble with this camp was the fact that there was no provender for the horses, and they must have been tired and hungry both, for they had been heavily packed and had had a hard day of it jumping logs and keeping their feet in dangerous places.

When Mead went for water he instinctively went over to Stink Creek instead of the Brightenbush. Curiosity will be the death of that boy yet. Doubtless he wanted to find out what gave it the name, even if it choked the whole crowd to death. Of course he found only the very finest of mountain water, and when he returned he reported the fact. "Well," said Myers, "I'll tell you what gave it the name. Some time ago a party of fellows camped about where we are camping to-night, and one of them shot an elk just a little way above. It fell in the creek and he dressed it right there, and when one of the tenderfeet went to the creek he found a condition that suggested a name for the creek, and that name has stuck to it to this day, except that when they came to put the name on the map they modified it a little and just called it Stink Creek."

"I understood that we were to be at Waldo Lake for our camp to-night," said Mears with an emphasis and inflection only used by him when his remarks were intended for Christy.

"Well," said Christy, "we are here and we can't be any herer," and the general silence that followed this wise declaration only seemed to emphasize it.

Night shut down quickly, and we had scarcely unpacked the horses and swallowed a quick supper before it was pitch dark. Then came the camp-fire, pipes, stories, and lastly blankets, just as of old, and which always have been, are now and always will be the most enjoyable parts of mountain trips. And when the camp-fire has burned low, and quiet repose is restoring sorely taxed energies, how natural it is to lie there looking up at the peeping, half hidden stars, listening to the commingling voices of the forest and contemplating the marvelous symmetry and wondrous beauty of nature and her works. The giant pines and firs seem whispering stories to each other of the past, and you vainly try to hear. The gurgle of the stream and the sigh of the night wind modestly vie with each other in soothing your weary brain and softening the voices of the night that are singing their sleepy lullabies in your drowsy ear. Gradually the eyelids fall, imperceptibly the nerves relax, and sleep "dims the sweet look that nature wears."

No time was lost next morning in getting under way, for we were all anxious to reach the lake, for many reasons, more particularly for the reason that the poor horses would have nothing to eat until they arrived there. But it was nearly night before Christy's shorter route brought us to our destination. And let me assure the readers of FOREST AND STREAM that we found out all about Stink Creek and the P. Warmer before we got there. If I felt in my heart that I was forgiven for the wrong that I was partly instrumental in perpetrating upon those poor horses on that trip, I would take a solemn oath that—well, that I am likely to do the same thing again the next time that some idiot asks me to. It was a hot day—yes, a very hot day—and whenever we left the shadows and got out on the precipitous mountain sides, where the sun could strike us, I imagined that I could smell brimstone. Possibly Stink Creek got its name from some other fool that went by Christy's shorter route to Waldo Lake on a very hot day. If the creek had never been named until now, I could tell you easily enough how it got its suggestive appellation. Christy is very fond of Worcestershire sauce. We had all objected to any such encumbrances, but he had sneaked a bottle into Mead's fish basket, and we carried our baskets to relieve the horses. Mead and I were bringing up the tail of the procession and sweating like butchers. Every now and then Mead would wipe the perspiration from his manly face and with a sort of saintly resignation declare that in all his life he had never sweat so before. He kept asking me if I observed any peculiar odor. I thought I did, and after a while it became so pronounced that we concluded that he might be in a serious condition, and an immediate investigation was decided upon. Then we proceeded to investigate. On one side his pants were in a condition that suggested that something might be wrong in the fish basket, and so we examined the contents. The stopper had come out of Christy's Worcestershire bottle and the peculiar odor was easily accounted for.

We arrived at the foot of the P. Warmer early in the afternoon. It was all and even more than we had anticipated. Geographically it was about three miles high, semi-perpendicular, and the last and loftiest step to Waldo Lake by the Christy shorter route. Geologically it was loose shale or what is commonly known as broken shell rock. Meteorologically it was the hottest climb on earth. If it derived its name from some old settler, the present generation might find some relief if his first name had been written in full. Of course, the P. could not have stood for Pity, Patience, Piety, or any of those gentler feminine names, but it might have stood for Peter'd, Pedestrian or some such name. If it derived its given name from physical characteristics, it is entitled to all the alliterative P's descriptive or even suggestive of such an infernal place. The boys think, however, that its name was the result of spontaneous combustion in Christy's over-heated imagination, and has no particular significance. At any rate, the P. Warmer is a Jim Dandy and no mistake.

Before commencing the ascent we left all the packs except a few blankets, a little grub and the fishing rods, all of which were strapped on Ed's big brown mare. The little roan had to be helped up without any pack.

There is an element of suffering in sympathy, and I shall spare FOREST AND STREAM readers the sympathetic pains of our ascent. The big brown mare fell once and rolled over five times—some of the boys said six, but a turn or two doesn't matter—and brought up against a rock fifty feet below. We all thought she was surely killed; but she hadn't a scratch, and her fall didn't even start a ferrule on the rods. But the bread box bursted and left ample evidence of some kind of catastrophe. After three long hours' climbing we reached the summit, looked over among the shadows beyond, whence came a breath of refreshing coolness, and we appreciated the fact that at last we were at Waldo Lake. S. H. GREENE.

PORTLAND, Oregon.

[TO BE CONTINUED.]

LIFE ON THE KANKAKEE.

CHICAGO, Ill., Oct. 16.—In these days of literary and artistic activity there is continuous search for new fields where there may perchance be obtained those indefinite things vaguely called types, color and atmosphere. So ingenious have been the writers and artists, and so judicious the editors of the great thought mills, that at times, the conviction is forced upon one that all the fields, types, colors and atmospheres—except the good ones—must long ago have been exhausted. Local dialect and local realism have done a great deal for the literature of this country, because they have made everybody want something else. At times this realism is so unreal as to be grotesque, but it goes just the same, because the people who do the reading don't know anything about the new "field" which is exploited, and the people of the "field" do not do the reading. Any one must at different times have seen in the monthly magazines of the land bits of local color which were things for wonderment. Any old new field is worth a hundred dollars if one can add a guarantee that no former pen has ever tilled it. On this basis it seems to me that "Chicago and the West" ought to be worth $100 this week to anybody, or perhaps, more accurately speaking, worth an additional $100 to anybody on account of the literary tip it contains about a new field.

It is a great deal nicer to be a newspaper man than it is to be anything else, as of course everybody knows; but what I want is a partner, a writer, a man who wears kid gloves and unbagged trousers, and who has the *entrée* to the literary chutes which lead on to fame and plunks. Such a man I am willing, for the sum of $50—a fair divide—to take into a half interest in my new field, in which I promise him a good line of types, an assorted lot of color and atmosphere a plenty. He can make his own dialect. They usually do, you know.

In order to show good faith on my part I presume I should give some more specific mention of my field. It is no less than the great Kankakee country of Indiana. So far as I know, there has never been any literary handling of this unique and distinct field, which, as is so often the case with good things, has been right at hand all the time.

The Kankakee Marsh country is a bit of the world entirely apart from the rest of the universe. It is inhabited by a class of people out of the ordinary—uncommon, peculiar. This class has held its own peculiarities for generations, after the waves of other days and other customs have swept by and entirely surrounded it. We might expect to find types so strong a thousand miles away in an undiscovered country, in the mountains in Carpathia, in Africa, in the valleys of the Rockies, or the pine woods of the far unsettled South; but who would look for them within fifty miles of the second city in the whole country, where a gathering of the wonderful and beautiful things of the civilization of the world remains a fresh memory? In the middle of affairs, in the path of cities, on the edge of world's fairs, the Kankakee country has held its own, very much less changed in the same time than have been Montana, Wyoming, Colorado, California. The marsh dweller of the Kankakee has indeed been a type for you. He has not changed. He has stuck to his environment, and the environment has been stern enough to keep out the world, including writers.

Very far be it from me to ridicule in the least way the typical marsh dweller of the Kankakee country. One might laugh at a wealthy city man, who has achieved all the failures which go with what is called success, but never, if he understood his man, would he laugh at the marsh man, for here he would have a character enduring and bold and manly enough to stand up by itself, a character of strength and independence enough to command the respect of any one who saw it well enough to understand it. The city man is afraid of a policeman, and has a dread of the law. The marsh man is afraid of no one, and does not know what the law is. The city man is solicitous of fashion plates, but the clothes of his fathers are good enough for the marsh dweller. The city man would know always what are the ways of others. The marsh man cares not at all, for his own ways are good enough for him. He does his own thinking and is himself all the way through. This he has been for many years, in the meantime there having passed quite away such types as the Western hunter and trapper and scout and explorer, now applauded as belonging to the picturesque past, when men had to be men to make a living.

Life on the Kankakee was never exactly a bed of roses. The baby that opened its eyes first upon the wide seas of grass and the low blue ridges of timber land could not have had the gift of prophecy or it would never have been satisfied, and would have hustled back home on the trailing cloud of glory with which Mr. Wordsworth tells us babies come hitherward. Perhaps the baby hustled back anyhow before long, for the malaria of these swamps was ever potent against the young. The father of the family bought quinine by the bottle when he sold his game in town, and whisky according to his lights on the questions of domestic economy. At night the cold white mist of the malarious river region lay like a blanket of death over the land. He who survived this for a lifetime was lean, wrinkled, toughened and yellowed. His children were suggestions leading up to that conclusion irresistibly, according to their different ages.

The genuine Kankakee Marsh man never did any work. Of course, since the days of modern sportsmanship on those marshes he has been the boat pusher for sportsmen at the clubs or elsewhere, but it never was any work for one of these men to push a boat. Oars or a paddle he despised, but though you watched him all day long pushing his boat up the swift rush of the stream or over the marsh where it seemed a boat could not go, you could never see any distress in his movements or any hurry in his steady sweep of the long push paddle. That was no work, for he was born to it. His environment meant that he must learn it. The little house he had on the high ground near the river cost small labor to put up, and once up it lasted for a long time. Its furnishing cost little, for never was life more primitive than here. Perhaps there was a cow or two, more or less amphibious and web-footed creatures, but these required no care to speak of, nor did the swine which made their company about the yard. A little hay was made, but this not strenuously. A little wood was cut when the fire was out. A little food was on hand when meal times came, or if it was not it was easily to be had with net or spear or gun. Work as we know it there was not. The "farm" could not be farmed. Everywhere was the river, the marsh, dominating all with its monotone of theme. Even, flat, uneventful, yet strong, was the flow of life on the Kankakee. The marsh man dwelt apart, and so had time to think, as does the settler of the mountains or the plains. So he gained individuality, vigor of character, strength of type, if you will. He troubled not the schools with his children, for it was far across the marsh, and he did not wish his kind to mingle very much with those who dwelt upon the high ground and who thus were objects of suspicion. Churches he had none. At times he and his sons went to a dance, and there danced or perhaps cheerfully fought, as was made necessary by the ethics of the marsh. It is the attitude of folly to say off-hand that the ethics of the marsh are wrong and ours are right. Nothing is actually right when you catch it outside its own dooryard. The dooryard of the marsh man was the same for generations.

There never was at any time or in any country a class of men who more truly lived off the gifts of wild nature than did and do the native dwellers of the Kankakee. In earlier days they were accused of taking a few horses now and then, and the marshes at that day no doubt harbored many bands of lawless men who might better have been out of the country, though nowadays all that is changed. The marsh man of the Kankakee is not dishonest. He might fight a little if you transgressed his notions of etiquette at a dance, but he was not actively bad. He would not steal from his neighbor, because, partly, his neighbor had nothing worth stealing. He would not grow angry easily, but if you had committed what to him seemed the great crimes he would calmly kill you perhaps. Certainly he would not have you arrested, for with the law he had no concern. These men had their own notions about law. I say it with no disrespect and with no wish to deride them, but rather with a feeling of admiration, that probably no more lawless a class of men ever lived in the land than these marsh men of the Kankakee. Yet they were not troublesome, they were not criminals, they were not openly endangering the rights of others. They wanted nothing the outside world might have, but they insisted that the outside world had no right to tell them what they should do. For law, as law, there never was any respect or awe whatever on the Kankakee, nor will you to-day find it there. Yet you may find a simple-minded and straightforward people, generous to the last degree, hospitable as any of the country, free with what little they have and not in the least churlish or disobliging. The marsh man is contented to let you live as you like. He does not worry about you at all. He is not looking for types. He only asks to be let alone.

The Kankakee native was always a hunter, a fisher and a trapper, and such he is even to-day. No better shot at wildfowl ever lived. He began in youth to shoot and so

had that perfect skill which never comes to the late beginner. He did not kill his ducks part of the time, but all the time. If a bird was too far to kill he did not shoot at it. Never was there a man who more perfectly understood the animals he pursued. He was as much at home on the marsh as they. Where the city shooter would not dream of venturing on the quaking bog he trod with fearless heart, knowing just what spot was safe to step upon and what was not. He was as weatherwise as the wild goose. He knew by instinct which way the wind would blow, what day the ducks would fly, which way they would feed. Cunning and secretive and politic withal in these later days, he pushes you now wherever you prefer to go; but he does not tell which way he would go, if it were in the old days, and if the flight were coming in, and if the wind were as it is to-day, and if he himself were alone out on the marsh. Never in his heart of hearts has the Kankakee River pusher learned any actual respect for the city men he takes out shooting. He takes their money and endures their advice or orders and does his day's work faithfully, and stands the torture of witnessing bad shooting, but down in his heart he must be always thinking "What a duffer this fellow is!" Externally he is always polite. Without his aid would half the good bags be made we read about? I trow nit. It is the pusher who gets the boat into the mallard hole, and it is his eye that marks to a hair the place where the dead birds fall, and who goes out to them, walking on his paddle laid down sometimes, and springing on and forward always just ahead of the line of sucking bog that chases his feet hungrily. While the sportsman shivers bundled up in his sweater, the pusher is warm with his shirt collar open. He does not mind the rain or a bit of snow or ice now and then. This sort of man I admire. On many and many an occasion, when the boats start out over the marsh from the club houses, the sportsman is the man in the stern of the boat.

In the days before the sportsmen came on the marsh the marsh man was a market shooter, and he remains such to-day. He has not and never will have any respect for the laws alleged to protect fish and game. He does not tell you what laws to make about your sheep and cattle, and he does not care what laws you pass about taking care of his fish and game. There has come down to him from his ancestors the American feeling of ownership in the wild game of the country. Heredity has given him the sense of rightfulness in his intention of taking the game and fish when his necessities dictate. He does not farm or labor for hire, and he must live, and here is all this means of living about him upon which his father lived, and his father before him. Who shall say him nay? The marsh is wide. Detection is impossible. The law is something very far. There is no argument about this.

There are many ways of making a living along the strange Kankakee country which are not known to the city dwellers. Our marsh man, now grown, let us say, into a slender, sallow-faced, stooped, sinewy and strong young man, knows every secret of the earth and water of his country, and so he lives, representing the fittest, who have survived there. In the spring he shoots ducks, of course, as long and late and as early and steadily as he can. Meantime he meets the first run of the pike and the wall-eyes as soon as the ice is out, and diligently spears and nets them to his great satisfaction. He has a few set lines out all the time he is along the river. He also nets turtles steadily—something you never heard about, perhaps, but which he finds remunerative. He traps muskrats till the weather gets too warm, of course, and knows all the ditches and river bends and cut-offs where these animals are best to be found. He shoots jacksnipe when they appear in the spring, and big yellowlegs, and all birds that bring any price in the market—none which do not sell well. He has a bad time in the summer for a while, but then he goes to gathering mushrooms—another thing the city man does not know, though this is quite an industry too along the Kankakee. The marsh man eats dogfish now, in tender faith that the Kankakee will not betray him, but bring to him only things fit and good for him. The stranger that visits him when he has dogfish for dinner will perhaps not be happy, for unless dogfish is well cooked it tastes like a mouthful of raw cotton and feels like a piece of sponge.

By the end of June or earlier the marsh man is out shooting woodcock, and making one of his best harvests of the year—one of which he is always very slow to talk, for it is well to be careful about giving away a gold mine. Incident to the woodcock shooting is that of killing the young wood ducks which breed along the river. These illegal birds bring the best prices.

By July the young prairie chickens are big enough to shoot, and these bring great prices too in the city. There are a good many chickens still along these great marshes, and in regard to them there is very little law in force. There are wild grapes of a fine sort ripe by summer time, and many berries. There are frogs to sell too, and sometimes the marsh man sells these, though not often, except the big bullfrogs, which of course he hunts, because they always bring a good price in the markets.

By August the young illegal teal are ready to shoot, and by September the plover are about, and also the jacksnipe again, and the rails and some ducks. I have told in another article how the marsh man hunts rails with his cur dog, and how he sometimes sells bitterns for "English partridges." He hunts now regularly for snipe and ducks especially. When he goes out on the marsh to shoot he takes his lunch with him—bread covered with honey. The honey he got out of a bee tree, of which there are many along the Kankakee River, though you do not hear the native dwellers say much about it. In the fall also there are many mud hens, and these the marsh man eats as steady diet. At times he has a bit of raccoon, for the cur dog is a good one to trail a coon or a squirrel, as well as a crippled duck or a king rail on the marsh.

In the late fall, when the ducks have gone South, the marsh man may get a few shots at quail along the thickets, sometimes killing a dozen or so at a shot. He begins now to trap for skunks, raccoons, and the like in the woods. At rare times he sees signs of an otter, and if the otter is to live through the winter he will live it at another part of the country. Trapping for muskrats of course goes on out on the marsh all fall. Then comes cold weather, and only the current of the river or the ditches keep the ice from covering everthing over the marsh. The native hunter knows yet another thing or two. He knows that the big marshes of the Kankakee are famous grounds for mink, and he takes the faithful cur dog and goes out after mink, hunting along the ditch banks and under turned sods, where some man has been foolish enough to plow a bit. Last winter he killed 125 mink this way, he tells you, and the winter before eighty-five. This winter the old dog is getting a little old. He does not know whether he will do so well as 100 mink or not, but he hopes so.

In the winter time a wolf may come in over the frozen marsh, and if he does he is sure to be trapped. The thousands of cottontail rabbits make an easy source of food supply, but they do not bring anything in the markets or they would all be shot. The white egrets which used to come to the roost in the heart of the swamp were long ago shot off. Anything which can be sold in the markets is shot, no matter what the season, and many birds, it is sure, are used for the city markets, of which the reticent pusher does not always tell you. If the prairie chickens band up and roost in the timber in winter they are shot, and if they roost on the grass lands they are trapped. There is no sort of wild game whatever, or of wild creature or product having available quality for the table or market, which is not laid under tribute constantly by this sharp-eyed marsh man from season to season of the whole year. Sharp indeed must be his eye, and sure his hand, and keen his faculties, thus to live at this day of the century. Yet it is no romancing to say that many of these men do live thus, and with little or no other work from one end of the year to the other. They count more or less upon the sportsman trade that comes to them. Some of them keep rude little hostelries, where sportsmen can put up, and here the head of the family 'tends house when too old to shoot. He may charge a dollar a day for board, and his son will charge two dollars or so a day to push you on the marsh, and a boat is rented now and then, or a horse and wagon hired to a shooting party, so that in one way or another the marsh man makes a living. He will tell you with pride that one year he took in $300 at his place. Some of the most independent of the marsh men are the boat pushers who live near some of the shooting clubs. For three or four months in the year these men have fairly steady work at $2 to $3 a day and their board. These men are very often manly and intelligent fellows, with a smattering of experience and life, and open, pleasant manners. They are gradually losing type and becoming changed to the humdrum of workaday existence. They may chop wood in winter, which certainly an old-time Kankakee man never would have done. Of farming they cannot do much, for the land does not permit it. What could such a man do in the hot competition of modern town life? He feels his fitness for the life on the marsh, his unfitness for any other life, and it is small wonder if he views with a growing sullenness the encroachments of the farms and fences which now begin to hem him in.

Without over-drawing or exaggeration, we may say a large class of men have long lived as above described on the marsh country of the Kankakee, a strip of ground say 150 miles by 5, 10 or 25 in width, as it overlaps into other marsh country. If my friend, the writer, would find his field and his types, let him not delay too long. All this must change. Within the last ten years the big land companies have been buying up the cheap marsh lands along the Kankakee. At first they were laughed at, but there now appears the craft and waiting ability of the capitalist. Great ditches cross the marsh in many ways. Hay making is followed as a regular industry, and hundreds of cattle have been ranged on these marshes in the last few years.

This month yet a new place seems to have been found for the wild Kankakee marsh land in the products of civilization. The dispatches say this very week:

"Chicago capitalists have secured options on several thousand acres of land in La Porte and adjacent counties, this large area being located in the Kankakee region, for establishment of an industry that promises to revolutionize a branch of the paper-making industry.

"It is said that experiments have demonstrated that by a new process an excellent quality of binding twine and building and roofing paper can be made out of the long grass that stretches away for miles in the Kankakee swamps.

"The process is controlled by a syndicate of capitalists, and it is proposed to develop a new industry on a large scale by the establishment of a number of plants."

No other body of wild land could have been in the entire country found so near a big city. The land was bound to be used. Many railroads now cross the marsh, of course, and now telephone lines are building over it, and pipe lines from the oil fields of Indiana. The tilled farms come down to the edge of the marsh, and more and more they eat into the wide sea of waving grass which for so long has been uncrossed by the craft of modern ways, which has held within its secret places a people who were of themselves, a class distinct and notable. These people to-day look on with their hands in their pockets as they see these things coming on, apathetic, in a way also sullen. I have heard them ask bitterly, "What chance has a poor man to-day?" And indeed what is his chance? What are his prospects as he looks into the America of to-day—this man, this American pure and simple?

This year the old Kankakee went back to the customs of other days. The floods came over the land again and the ditches were futile. Where last year there were tons of hay standing, this year the rail and snipe are flying. On the edge of the marsh the eager plows of the farmers last year had been turning the earth, seeking for a place to put a seed which should bring forth an ear or so of food. Last year there were cornfields where this year the tall, rank marsh grass has sprung up and covered the earth again, so that only here and there, over the tops of the strong, red rushes and broad-leaved grasses can there be seen a faint and faded white tassel of corn, held up like a hand beckoning distress out of a sea of despair. One year of water eats up a dozen years of drought and ditching. The marsh creeps and crawls and grasps for itself strongly, always thinking of the past it once knew and cherished.

One of these marsh friends of mine and myself were looking out over the marsh together a few days ago, both of us silent. At last I said: "The old river is claiming her own again, isn't she?" Something like a gleam of satisfaction and triumph crossed his white-brown face as he said slowly: "She holds her own." E. HOUGH.

Natural History.

HUMMINGBIRDS IN THE WINDOW.

Editor Forest and Stream:

Akenside painted the "Pleasures of Imagination" in glowing colors and thereby gained his only moiety of fame. Now let some one who is hankering after that elusive stuff take for his theme the "Pleasures of Lying," and if his genius is equal to the task he has an equal chance for immortality.

Some scribblers seem to think that if they haven't sound material to build a story with they are privileged to manufacture what they need to make it interesting, and this innocent lying is indulged in so very freely that I imagine there must be lots of pleasure in it.

Some time ago I was wicked enough to chuckle over a bit of work in the Natural History column of FOREST AND STREAM, wherein it was stated that a pair of tame hummingbirds had a little disagreement about bathing, and that the bather would take the other by the hindleg and drag him into the saucer of water! If inventing it gave the writer as much pleasure as the story gave me I do not blame her in the least for writing it, though as an instructor in natural history I hardly think she's "in it."

And now comes another, from the *Home Journal*, which in its flights of fancy fully equals it. It is headed "Hummingbirds can be Tamed," and then relates two cases, one of which was that some of them were kept for some time in the window of Mr. Taylor's restaurant on Broadway, and that they drew a constant crowd.

This was so improbable that the temptation to investigate it was irresistible, and I asked Mr. Taylor whether he served up hummingbirds at his tables. He blandly smiled when I told the story and said that no such attraction was ever in his window.

The other part is not so easy to investigate, as the lady's name and address is not given. It states (not under oath) that she kept the little imaginative creatures in her parlor, and that among their other wonderful doings they built their nests in her lace curtains and hatched out lots of young ones! What could be more interesting? I regret that the little rascals spoiled her curtains, but there need be no loss in such a case. If she had taken her scissors and cut out the piece of curtain with the nest attached she might have sold the curiosity at almost any price. It may be that she has preserved it, and if so I hereby offer to contribute $100 to the "Society for the Promotion of Lying" if she will merely let me feast my eyes with a look at it.

I read in one of our magazines some months ago a chapter on "Hummingbirds" by a writer who showed a thorough knowledge of her subject in every line, but she could have enjoyed none of the "pleasures of imagination" in writing it. DIDYMUS.

ENGLEWOOD, N. J., Oct. 13.

THE HORNSNAKE.

SOUTH CAROLINA.—*Editor Forest and Stream:* For many years I have taken great interest in trying to find exactly what underlying truth there is for the many stories of the horned snake which survive in tradition and occasionally appear in the daily papers, often with apparently ample authentication.

The father of all the stories (not the snakes) I found in an old "Report to the Lords Proprietors of the Carolinas," published in London over two hundred years ago. This able-bodied progenitor of myths stated that this country was the habitat of a snake whose tail was a poisoned horn or spike; that it took its tail in its mouth, and, making a hoop of its body, rolled after its victim; but the victim always escaped by jumping behind a tree, into which the snake drove its horn so that it could not draw it out, and snake and tree died together, the tree shriveling up to a sapling.

Of course, that story is a little robust for this century; but I have met a number of educated and intelligent persons who profess to have themselves seen snakes with one or more of the following peculiarities: (a) With horn tips to their tails; (b) with disposition to strike with this horn as a weapon; (c) with a sting like a bee's in the horn.

Now, it is a fact that no recognized naturalist has ever described in this or any other country any true snake with a true horn on its tail, or with any sting in its tail, horn or no horn. And if there is no true horn or sting the motions interpreted as efforts to use the tail as a weapon lose all significance and must be set down as accidental contortions.

Chambers's Encyclopedia does indeed describe two snakes as having tails "terminated with a spine instead of a rattle." They are called the *Trigonocephalus rhodostoma* of Java and the *Lachesis mutus* of Tropical America. But, on the authority of Prof. True, of the National Museum, it may be stated that the so-called spines are only the usual harmless horny caps found on nearly all snakes, and that that on the Java snake is about the same as that on our common copperhead, to which both the other snakes are related. That on the *Lachesis* is the longest on any known snake, but is only the harmless scaly cap after all—not used as a weapon or capable of such use.

But while there is no true snake with any true horn, there are true snakes with apparent horns, and there are also apparent snakes with true horns; and in every apparently authentic story of a horned snake which I have ever been able to trace either the horn or the snake turned out to be only apparent. Of course I bar young rattlesnakes, the sprouting of whose rattle is a horny button, but not a horn in the sense of this discussion.

Now let me explain the apparent horns and apparent snakes which have deceived casual observers, and your readers can then each investigate for himself any case he meets or hears of, and determine whether or not he has discovered something new in natural history. And if anyone is so lucky, do let him put it in whisky and preserve it, lest it be forever lost—like the cause of the aurora borealis, which a college student once told his professor that he did know, but had forgot. If you ever find the true horned snake don't let him be lost.

The apparent horn sometimes found on true snakes will only impose upon one who has very small ideas of horns. The scales of a snake are true horny substance, and where the tail tapers down to a fine point the last tenth

of an inch or so is indeed nearly all solid horny material of overlapping scales. But such a merely scaly tip is not properly to be called a horn in the ordinary sense of the word. I once had in my possession for a month a snake said by its captor to have not only the horn, but a sting in it. It had no more the one than the other. It was only a common *Farancia abacura*, bluish black, with some red bars across the abdomen. It came from Louisiana, and that species, both there and in Florida, is popularly supposed to have the horned tail, and perhaps a sting in it. Consequently many persons who see them imagine they see the horn and sting, just as those who believe in planting by the moon always see results to confirm their theories.

So much for true snakes with apparent horns. Now as to apparent snakes with true horns. I call them apparent for short, because they differ so much from all our ordinary snakes. In fact, however, anatomically they are as good ophidians as any other family of the four into which naturalists put all the serpents. I refer to the *Scolecophidia* or worm snakes. These are snakes which burrow in light soil, under old leaves and logs, and live upon insects and their larvæ. They are nearly blind and almost destitute of teeth. Their bodies are rather stiff and their scales exceedingly smooth and glossy, as it is plainly much better for a burrowing body to be. And several of their varieties have a real solid horny end to their tails, evidently intended to give them a good purchase in their burrowing. They have no large "ventral" scales running across the abdomen and giving the purchase for crawling to our ordinary snakes, and briefly it may be said "they are not in it" at all with every-day snakes. They are practically big scaly worms. But they have the horn tail and they are the only snakes yet described in any natural history with an honest horn.

They are not very common, I think, for I have never seen but one, though I have had them hunted for a good deal. The one seen was on North Island, Wingate Bay, S. C. It was about 15in. long and about the last inch of its tail was apparently solid horn tapering to a point, but too blunt for use as a weapon. Its coloring suggested a reddish Scotch plaid. But any reader finding any snake with a real horn can readily tell whether it is a *Scolecophidia* or worm snake by the presence or absence of the broad ventral scales by which our ordinary snakes crawl. If his horned snake has none of these, but only small smooth scales alike on back and abdomen, then he has found only the well-known worm snake. But if it has a good, honest, indisputable horn with big ventral scales he has something which no museum possesses and no naturalist has ever described. E. P. ALEXANDER.

WOODLAND BIRD NOTES.—V.

Amidst Autumn's Woods.

"Now half the birds forget to sing,
And half of them have taken wing,
Before their pathway shall be lost
Beneath the gossamer of Jack Frost."

NO ONE perhaps realizes so strongly as the naturalist the characteristic mood of the several seasons, a mood and atmosphere so peculiar to itself as to give to each of the seasons much of the dignity of personality. October has a mellow, ripened glow distinctly its own, and is considered the most glorious month of the year, though in this respect we may say it is perhaps rivaled by June. To the artistic eye it is truly beautiful; the foliage of trees and bushes of lovely tints of scarlet to various shades of red, orange, yellow or brown. The atmosphere is clear, bracing, and "puts life into one's self," so to speak, which the air of June does not do.

To the ornithologist, however, it is a sad season, for as the leaves are disapppearing from the trees so are our beautiful summer birds from our woods, fields or orchards; in fact, we are like a boat in a storm, drifting helplessly upon the rugged and sharp months of winter. How commonplace the robin or song sparrow seems, among the gay procession which throng our woods in summer, but how welcome they are when all the other birds have gone, and how soon forgotten when they return in the spring. The throng of transient visitants is slowly disappearing, though some are still here. The first birds to come to us in the spring are the last to go in the fall. So the myrtle warblers, hermit thrushes, purple grackles, red-winged blackbirds, phœbes and many others that arrive in March and April are still here, and in all probability will be here for another month yet. It is strange to note the mingling of the different species at this time of year. Summer and winter residents and migrants will be found in the same flock. It is well to note how the plumage of the birds agrees with the seasons. In winter the birds with dull and quiet plumage are found, as for example snowbird, chickadee, nuthatch and winter wren. With the approach of spring the plumage becomes brighter, as in the red-winged blackbird and meadowlark in early spring, and as summer approaches very gay and bright colors prevail, as in many of the migrants and most of the summer residents. During this recent warm spell the migrants and some of the summer birds are still lagging, while the cold weather in the North are driving the winter birds southward. Many of the migrant thrushes have gone southward, but the hermit is still here. The Canadian nuthatch, black-throated green and myrtle warblers are here, but in small numbers, and in a few days will probably follow their brethren to warmer climes. Those tiny midgets, the ruby-crowned kinglets, are still extremely abundant this fall, but they are only a passing visitor and will soon be gone. In winter birds the white-throated sparrow, junco, winter wren, brown creeper, etc., are very numerous and become more abundant each day. Yesterday (Oct. 15) I saw a large flock of pine finches, redpolls and purple finches. These birds are distinctly boreal birds and are rather rare here even in winter, and then only of local distribution.

In spring the ornithologist is ravenous for the sight of bright colors. There is starvation in his eye that has lived the winter long upon a diet of black and white, gray and brown. How it absorbs the ruddy tinge of the first robin and the delicious hue of the early bluebird. Variety is not half so essential a spice of life as expectancy. Indeed, from the cradle to the grave anticipation is more than a spice; it is a larger part of the very subsistence of life. We all live more in the fairer to-morrow than in to-day, and find more exhilaration in reaching forth for new fruit than enjoying the fruit in the hand. One of the best things to be said about immortality is that it means a future never drawn upon. EDWIN IRVINE HAINES.

NEW ROCHELLE, N. Y., Oct. 17.

QUEER WAYS IN BIRDDOM.

Editor Forest and Stream:

I read with great interest the letter by Robert C. Lowry about the "Sora or Rail Bird" in the FOREST AND STREAM of Oct. 17, more especially the part that touched on this bird's diving into the mud and remaining there during the winter, hibernating. That this seems impossible, that it would be miraculous if a bird did survive burial in mud for weeks, at once appeals to the ordinary student of bird habits and forms. But when it is considered that this story is related of the house martin as well, that people hundreds of miles apart hold the same belief, from, as they claim, personal observation, naturalists would better have a case before they cast ridicule on a marsh-folk's belief. More than once men have laughed at the tales of simple folk. One time a group of naturalists in an Egyptian hotel laughed uproarously when a man said small birds rode on the backs of large ones, yet any ten years of the FOREST AND STREAM'S volumes of Natural History columns would prove beyond a doubt that small, weak birds ride on sturdy birds' backs during migration.

The observations of a German scientist on the house swallow that builds its nests on the sides of houses seems to prove that birds hibernate. We know that woodchucks and many other warm-blooded animals fall into a torpor in the fall that lasts many weeks, with scarcely any interruption.

We learn to-day of things that seemed impossible a year ago, or yesterday. There must be some one among the FOREST AND STREAM'S readers who could tell of birds in mud apparently asleep. I say "must be" because I have read in a great many articles, mostly FOREST AND STREAM ones, about this belief. In an old history of Vermont, published about 1812, appears the author's statement of a friend's story to the effect that the swallow sometimes hibernates in mud. He believed the friend's story. There are other similar tales. The reason many most extraordinary tales are suppressed regarding doings of birds is that the observers fear being laughed at. I venture to say that within ten years the man who states in the FOREST AND STREAM that the swallow and rail never hibernate will be laughed at, as I would be if I said a wren never rode on a goose's back.

NEW YORK CITY.

Migrating Hawks in Kansas.

SWARTZ, La., Oct. 15.—*Editor Forest and Stream:* While on a visit to western Kansas recently I found that long suffering State, besides containing grasshoppers, thousands of hawks—hawks of all kinds, little hawks, big hawks, middle-sized hawks, sparrow hawks, chicken hawks, some as large as small eagles.

My friend and I started out early Monday morning from Great Bend for the Cheyenne Bottoms, famous as the meeting place for a number of seasons of the Altcar Coursing Association. With any water on the bottoms, as there is this season, there is usually plenty of ducks, and the object of our trip was to bring back a few.

We found scarcely any ducks, but in their stead the prairie was literally covered with hawks, and in our opinion this was the cause of there being no ducks. I shot a colossal specimen; he merely thought I was feeding him and had missed his mouth, so my friend came to the rescue, shot and winged him. After he fell he was quite as formidable a wounded enemy as one would care to encounter; and I wished for a kodak to immortalize my friend as he threw rich Kansas soil and sandbur stocks at the gaping mouth and outstretched wings of this bird. It was finally dispatched with another load of shot. We found it measured 5ft. from tip to tip.

Just before we entered the bottoms we were joined by a young man, a resident of the vicinity, who informed us that hawks collected in this manner every autumn, evidently preparing for migration, as it was for only a short time they are so numerous.

The three of us devoted the remainder of the day to shooting hawks. They had grown very bold around the farm houses, where they were rarely shot at; we were not real sportsmen, as we took them from fence posts and not always flying. They have a habit of lazily sailing in the air out of shotgun range; but should they spy a mouse or bird in the grass and no gun about they swoop down with jacksnipe rapidity and seize their prey and off.

On our return home I winged a plover and endeavored to catch it under my hat; it was my friend's turn to wish for a kodak, as my method of capturing birds somewhat resembled the old game of leap frog.

I hope to return later in the season and find geese as plentiful on the bottoms as hawks were. E. G. D.

Live Elk in Massachusetts.

MR. B. R. ADAMS, proprietor of Moose Head Ranch, in Uintah county, Wyoming, has delivered to Mr. W. C. Whitney, Lenox, Mass., thirty elk for Mr. Whitney's game preserve on October Mountain.

Good Things Appreciated.

HAVERHILL, Mass., Oct. 22.—*Editor Forest and Stream:* I wish to compliment you on the appearance of the latest number of your valued paper. The Audubon plate looks especially fine.

I have long been a regular reader of the FOREST AND STREAM, and look as regularly to the day on which it is received as I do to meal time. In fact, I think I could go without a meal occasionally with less dissatisfaction than I should experience if the paper came not regularly.

Myself and wife have been especially interested in Mr. Rowland E. Robinson's writings, and we feel that we are very well acquainted with Uncle 'Lisha, Antoine, Sam and all the other characters that appeal so strongly to the average New Englander. We also have taken great interest in the reminiscences of Col. Mather, and are glad to note their regularity.

Wishing you the continued success that your labors so richly merit, Gratefully yours,

C. J. HALPEN.

Game Bag and Gun.

Our readers are invited to send us for these columns notes of the game supply, shooting resorts, and their experience in the field.

THE DEADWATER MOOSE.

Two men stood on a railroad platform and one of them said to the other as he held aloft his rifle: "This is the only genuine moose gun in all the world. This is verily the Harbinger of Death."

To which the other man replied, as he displayed his own favorite weapon: "And this is Death."

It was in such sportive and sanguine frame of mind that Mr. Fred Irland, of Washington, and the writer left the train at Boiestown on Sept. 16 last bound for a region called the Crooked Deadwater, where it was said that the bull moose, even Tim Lynch, the monarch of all moose, was roaring and roystering on the mountain side, shoveling his rivals into the lake and pawing up the black muck on the barren in sheer insolence of strength. We desired to arbitrate with Timothy.

The guide, who met us at Boiestown, was none other than Henry Braithwaite, of whom a certain red man, Jim Paul, once remarked: "Dat man Birthright got a turrible repytation, but, by gorry, I kin call a bull moose half a mile furder off 'n he kin." Jim Paul was right. Where Henry accumulates the deadwood on Mr. Paul is that he can call the bull moose half a mile "furder up."

The life of a woodsman offers little opportunity for brilliant or striking deeds. The best he can hope for is thoroughly to master all the multitudinous details of his calling; to face hard work and hard weather manfully; to glean from nature, by careful watching of her ways, as many of the secrets of the wilderness as he may; to learn the habits of all the wild children of the forest, and the uses and properties of tree and plant. I take little stock in heroes and less in hero worship, yet I feel like adding my word of tribute to what has been said by others of Henry Braithwaite. It is a liberal education in woodcraft to wander in the woods even for a few short weeks with him. He is a past master in every branch of forestry—a sort of rough and ready Nessmuk, who loves the woods as Nessmuk did—who cannot endure for any length of time the restraints of artificial life; who feels in the forest, not its poetry perhaps, but at all events its peace, its freedom and its majesty. It would take a great deal of the strongest kind of evidence to induce any one who knows him to believe that his superior as a woodsman can be found. Whether it is calling a moose, running down a caribou, trapping an otter, stringing a snowshoe, building a canoe or traveling on a bee-line through an unknown forest, Henry beats the Indian at his own game. In a land that is full of hunters and cruisers, red as well as white, the keenest of critics in their line of work, no one for a quarter of a century has ever disputed his preëminence.

We tarried at the hotel of the impassive, impersonal Mr. Duffy that night, and in the morning started with all our "stuff" for Pleasant Ridge, nine miles away, where the portage road enters the forest. Henry said as we were loading the wagon: "Now, we've got to forget something. Let us try and forget something we can do without." Whereupon Henry straightway proceeded to forget, of all things in the world, his axe, which Mr. Duffy, the silent, went back for while the team stood waiting in the road.

Just where Pleasant Ridge subsides, in the arms of the forest, lives a thrifty farmer named Mr. Holt, who keeps a sort of wayside house. Here we paused for provender and met our teamster, Mr. Tom Hunter, who was to pilot our luggage over the thirty odd miles of rock and root, hill and dale, brook and barren that lay between us and Fullerton's camp on the south branch of the Dungarvon River. Mr. Hunter was an old friend of ours. Two years before he had transported our traps by the old Dungarvon portage to Pond's camp on the memorable occasion when Fred got his first moose. We found that advancing age had not diminished the vocal powers of Mr. Hunter. He still faced the terrors of the "portash" without fear, enlivening the way with wit and humor, and encouraging the team with sulphurous remarks. Our route to the Deadwater wound steadily northward and somewhat to the west of the one we had taken two years ago. The old portage road to Pond's camp had not been used of late and was reported to be blocked with fallen trees. When we questioned Mr. Hunter as to the qualities of the new road he put it all in a nutshell: "The furder the wusser."

Our rate of progress, after the luggage had been transferred to a wooden-shod sled and the portage fairly entered upon, was very slow, owing to the weight of the load and likewise the tendency to pause displayed by the "off" horse. We had only made two miles when darkness, accompanied by rain, set in and it was necessary to camp. Henry soon had the tent up, the hand-junks cut, and various and sundry rampikes piled thereon, and we listened to the patter of the rain with supreme indifference.

The 18th was an ideal autumn day. Mr. Hunter employed his vocabulary with force and freedom and we made ten miles, reaching Richards's depot camp near Salmon Brook Lake. The "off" horse looked very solemn as he stood in the yard in the moonlight and thought of Mr. Hunter. In the morning Fred and I visited the lake, which we found to be three-quarters of a mile long and nearly as wide and very characteristic, in all its scenic features, of New Brunswick inland waters. On the west it was overlooked by a beautiful hardwood ridge that glowed with the gorgeous tints of autumn, the remaining sides were flanked with evergreens and bordered by tawny strips of barren. The comely tracks of moose and caribou were quite abundant on these barrens and large flocks of geese and ducks were feeding in a cove at the southern end of the lake.

The controversy between Mr. Hunter and the sorrel was resumed with violence next day. Our hopes of making substantial progress, however, were dampened and finally drowned out by a drenching rain that began early in the afternoon. We were now on the Rocky Brook portage, and the traveling was smoother than it had been; but the rain became so unpleasant that, after making a total of eight miles, we were glad to seek the shelter of a bark

lean-to that we found on the side of the road. Fred expressed a desire for a big fire, and I think he will admit in confidence that he got it. Henry and the teamster soon started a conflagration that bade fair to drive us out of the lean-to completely. At first the water found its way somewhat freely through holes in the roof, but when these were plugged with strips of bark and the small tent thrown over all, the roaring of the wind and the ceaseless fusillade of the rain gave us no concern. Henry argued stoutly that a fire would burn better on a wet night than a dry one.

In the morning the rain had abated. The route was a new one both to the guide and teamster. We wandered over a variety of very rough and very wet roads, went several miles out of the most direct line of travel, and finally one of the shoes of the sled gave out. It took the men just an hour to shift the load, make a new shoe and place it in position. We encountered a porcupine in the road, which Henry promptly dispatched with the axe, as he considered it a destructive animal. He remarked that about the only animal that would deliberately tackle the porcupine was the black cat, into whose anatomy the quills do not seem to have their usual power of penetration.

At 4 o'clock we reached Richards's main depot camp on Forty-nine Mile Brook and remained there for the night. Late in the evening a small digitigrade animal, black in color, with white stripes down his back and a white-tipped tail, meandered freely over the floor of the camp, inspected our provisions, and incidentally traversed the lower bunk where Mr. Hunter was executing a trombone solo. Fred and I lit the lantern and watched the movements of the intruder with some anxiety. We aroused Henry from his slumbers in the hope that he would take vigorous measures, but that worthy surveyed the scene with an air of impartial equanimity. He remarked as he curled his blanket again about him that he would "fix that chap in the morning." Before we left the camp Henry constructed a dead-fall similar to that which he sets for the sable and pine marten. When Mr. Hunter returned to the camp on his way out to the settlement he found the animal in the trap. Mr. Hunter found this to be the case when he was about two miles from the camp.

It was early in the forenoon of the 21st that we reached Fullerton's camp, the terminus of the portage. There was a large quantity of logging supplies at this camp, as well as at Forty-nine Mile Brook, in charge of a man named Patchell. For months at a time during the summer season Patchell never saw a human face. He was cheerful and contented with his lot, and showed every disposition to render us any aid in his power. He gave encouraging reports as to moose in the locality, also informed us that we could haul our luggage three miles further over a winter logging road which led in the direction of the Deadwater. This was important, as it would shorten the distance the men would have to pack the supplies upon their backs. Acting on his advice, we tackled the logging road, but found it so rough and the footing so treacherous for the horses that after going about a mile we decided to dispense with the team and pack our traps from that point forward to the Deadwater. While preparing for dinner we were joined by Henry's assistant, Dave Douglas, who had been for some days on the lookout for us, and also cutting trails in various directions, preparatory to Henry's winter trapping. We wrote a few short letters to the absent ones over the horizon's rim, and intrusted the same to Mr. Hunter, who at once set out upon his long and toilsome voyage to the settlement. It was pitiful and yet amusing to see the sturdy old gentleman light his pipe, board his chariot and resume his everlasting battle with the rocks and snags of the portage. A portion of our effects was placed under the big tent; the smaller tent we carried to the end of the logging road, about two miles north, and camped there for the night.

The next morning Henry and Dave carried up two more loads from the big tent, and as Fred and I were impatient to reach the hunting grounds a dash was made for the Deadwater through the trackless woods that afternoon in a storm of rain that soon developed into a liquid blizzard. Henry had never before attempted to reach his camp on the Deadwater from the Fullerton logging works, and did not know the exact distance we had to go. He endeavored to find a route on the high grounds, which afforded easy footing as compared with the barrens, and this made our tramp somewhat circuitous. From time to time he consulted his compass, and all the while the cold rain fell in torrents, drenching us to the skin. In some places we had to clamber over slippery, moss-covered rocks which threatened the integrity of our limbs at every step; in others we had to fight our way through a riotous tangle of water-laden whitewoods, and then a dense growth of firs would bar the way. I certainly could not recommend that aquatic excursion to the Deadwater for dudes and invalids. It was the hardest four hours' travel I ever experienced in the woods. We made few stops for rest, plodded steadily on, every particle of our clothing soaked with water, and still no signs of the camp. For a time the wild idea possessed us that Henry had lost his way. At last the guide turned abruptly to the left, we forded a swollen stream, and found ourselves at once within the shelter of the Deadwater Camp. Never was haven of rest more welcome to storm-stricken mariner than this homely trapper's camp to us that night. A rousing fire soon sent the sparks hissing through the smoke hole into the watery gloom, and after the kettle was boiled and a substantial meal of woodland fare stowed away, that terrible march over the trackless mountain side became a thing to joke about. It is these abrupt translations of light and shadow, storm and calm, vacuity and venison, that give to life in the woodlands its everlasting charm.

On the morning of the 23d there was a partial clearing of the sky. Dave left for Henry's camp on Little Sou'-west Lake to bring up a load of provisions. Henry has twelve of these camps in all, stretched over a distance of eighty miles upon his trapping grounds. In the afternoon Fred and I accompanied Henry down the trail about half a mile to a point on the shore of the stream, where he had a dug-out canoe nearly completed. She was about 25ft. in length, and would accommodate three persons with ease. Henry devoted an hour to grubbing her out with axe and adze, then launched her and poled her up through the rapids to the landing in front of the camp. Right across the stream from the landing Henry showed us the spot where, three years ago, he called up two bull moose and shot them, as late as Nov. 15.

Henry never calls moose after dark, relying upon his marvelous skill with the birchen horn to outwit the animal in the daytime; but as it was a beautiful moonlight evening he consented, at Fred's suggestion, to give us a taste of calling moose by night. After supper we took our places silently in the canoe and proceeded up the Deadwater. We had gone about a mile and a half when the guide, with that inimitable art which has made him famous, gave the call of the cow moose. The night was still and very cold, the fog rose in ghostly wreaths from the glassy surface of the water, and the thick palisades of spruce and fir on either side of us were traced in jet against the moonlit sky. The muskrats were out in force swimming around among the lilies, and in front of their house on the western bank a pair of beavers dived at our approach. The call rolled up the level expanse of the Deadwater, and returned to us in scarce diminished volume from the far-off southern hills. At once a wave of excitement swept over the stolid features of the guide, and he exclaimed in a hoarse whisper, "Hark! by thunder, there's an answer!"

Sure enough, we could plainly hear off to our right, up the west branch of the Deadwater, the oft-repeated and never-to-be-forgotten sound, "Oo-wah, oo-wah, oo-wah, oo-wah!"

The moose was probably not half a mile away and we could hear every intonation of his note with the utmost distinctness. Henry picked up the paddle and shoved the canoe swiftly and silently toward a rocky point covered with hardhacks that jutted out into the stream from the eastern shore. Fred and I tumbled out of the canoe as best we might and took up our station on the point. Then arose from the opposite shore, but further up the stream, a long, loud, weird, wailing cry that eddied and echoed from bank to bank and died away in a low, convulsive sob. We heard the guide as he sat like a statue in the canoe mutter between his teeth: "Listen to that cussed cow!"

Fred and I laughed silently to ourselves, but it was evident that the guide failed to regard the matter as a joke. He did not relish having to compete against the real thing. We remained at our post for perhaps an hour, and if ever we had any doubt that we were in a genuine moose country our experience in that space of time effectually removed it. Not only did the old bull up the branch continue to grunt at intervals, and the cow up the stream to lament her lonely state, but another bull away up the Deadwater commenced a solo on his own account. His notes sounded like the distant strokes of an axe upon a hollow tree. There was scarce a moment's intermission in the programme. Henry said there were plenty of moose around; all he was afraid of was that the larger bulls were mated and hence would not respond to the horn. Just as we entered the canoe to return to the camp we heard still another sound—surely the most awe-inspiring that ever is heard within the wild woods of this continent—the hoarse, angry bellowing of bull moose close at hand engaged in mortal conflict for the mastery. We heard their roars at intervals long after we had reached the camp.

Within a stone's throw of the rocky point aforesaid the Deadwater, whose ordinary width varies from 50 to 100yds., forms a narrow pass which is very appropriately called the Jaws. By reason of its narrowness and the shoalness of the water, which runs over a rocky ledge into the deep basin below, this is a favorite crossing point for moose and caribou, and, as we afterward ascertained, a path worn deep and hard in the solid turf by the traffic of many generations of animals, comes down to the water's edge on either side of the Jaws. While we were listening to the moose concert all around us we heard the rustle caused by some heavy animal making the passage there. We could not see what it was, though it was within easy rifle shot, and, taking our experience as a whole, we were united in hearty condemnation of the practice of calling moose by night. Had Henry continued to call and succeeded in bringing up a moose, either upon the opposite shore or at any point within reach of our rifles, we were satisfied that the prospect of our missing or maiming the animal was almost a certainty, and that even if we killed him the glory to be derived from such chance shots was very limited. We returned to the cheerful warmth of the camp-fire greatly impressed with the Deadwater region as a moose country and satisfied to take our chances for a shot in the daytime.

A slight flurry of snow greeted us in the morning, the earliest on record for this country. Henry employed himself in making a paddle and knees for the canoe. In the afternoon we embarked upon the Deadwater again, and as we followed its windings realized that it would have been a serious mistake to call it anything else than "Crooked." It was about three miles and a half from the camp to the head of navigation, while a straight line between the same points would not have exceeded a mile in length. To the north of us as we left the landing stood the towering peak of the County Line Mountain, where the counties of York, Northumberland and Victoria converge, and where Will Chestnut and Henry in December last started sixteen bull moose in one day. As we paddled up the stream the wind was blowing from the northwest. Henry called at the Jaws and got a distant answer, but after waiting for some time gave it up, and we continued on our course. From a barren to the west of us we heard two bulls fighting furiously, their roars of rage resounding through the woods for miles around. Fred and I suggested a still-hunt, but Henry said: "Better take it easy or we'll all run out of a job. We will tackle those fellows later."

We used to wonder afterward whether Henry's decision was dictated by reason, instinct or luck. The next turn we rounded revealed to us, in full open sight, on the left bank of the stream, a trifle over 100yds. away, his head facing inland, a monster moose, motionless as the hills—a statue of ebony against a wall of green!

I was in the bow, and as the canoe glided around the point was the first to see the moose. His ears showed that he was on the alert, but he did not see us. Apparently he had heard Henry's call at the Jaws and was pondering whether he had better desert the faithful partner of his bosom who was peacefully browsing in the bushes near at hand and go in quest of the phantom maid. His ponderings were brief. The wind was blowing from us toward the moose, and as it would have been hazardous to attempt to work any closer, Henry turned the canoe, with a silent sweep of the paddle, broadside to the animal, so that we had both a chance to shoot. Fred was very rapid on the pull and the Harbinger belched forth 550grs. of lead propelled by 120grs. of powder. The spiteful crack of the Martini followed immediately. The moose at this time seemed to think the locality was unhealthy. He surged inland through the hardhacks, looking neither to right nor left, and was evidently hard hit. Another broadside from the canoe and the moose sank to the ground within 40ft. of where he had stood when we first saw him. We paddled ashore and Henry proceeded to dress the carcass with about as much visible concern as he would have displayed over the skinning of a partridge. He was evidently proud, though, of the kind of stock he raised on what he called his "farm."

A great deal has been written by those who are wise, as well as otherwise, in the ways of the woods, as to the weight of moose. I will freely confess that I do not know what this moose weighed. I know he was so heavy that the three of us with a united pull could not shift him a foot in any direction. Henry is not a man who exaggerates, and he thought this moose would weigh at least 1,100lbs. We took a few measurements. He was 7ft. 3in. high at the shoulder. The neck, where it was severed from the trunk, measured between 5 and 6ft. around. The length of the moose as he lay stretched on his side on the ground, from the tip of his nose to the point of his hind hoof, was 12ft. 1in. The horns, which had twenty-four points, were 52½in. across and the palms 13in. wide. The length of the bell was fully 20in. He had a hole in one of his horns and another in his side, produced by fighting, and two of the brow prongs were injured from the same cause. Of the four shots fired two had passed through the moose—one just back of the shoulder and grazing it, the other midway between hip and shoulder, about 8in. below the spinal column. The first-named bullet struck no bone, and after it went through the moose, hit a fir tree about 5in. in diameter and went through that also. The other bullet was flattened by contact with the ribs, and made a very ragged wound as it passed out on the other side. Whether Fred hit that moose twice or I hit him twice or each of us hit him once will never be known upon this earth. It's a toss up between us, I think, as to which is the better shot. Sometimes I make life miserable for Fred; sometimes he makes it miserable for me. We took the situation very coolly when Henry steered us into action, but it is one thing to shoot straight on dry land and another to shoot straight from a small canoe on a windy day. I tried to make Fred disgorge the frozen fact and tell me who shot that moose, but he couldn't. My own mental refrigerator was equally out of repair. The best guess we could make was that I missed the first time and Fred missed the second. We returned to camp in a happy frame of mind.

Now, the Deadwater fleet comprised not only the new canoe, but two long, narrow rafts, known as "ramcats," which were moored in a "bogan" at the head of the stream. On Friday morning, the 25th, Dave was dispatched overland to this point, with instructions to bring down one of the ramcats with a load of meat. Henry and Fred and I again went forth upon the shining bosom of the Crooked to find another moose. We passed Dave two miles up coming down stream with a full head of steam, at the rate of at least one mile per two hours. Near the head of navigation a small brook oozes out through the black marsh mud. As we were passing this point we found the remains of a bull moose, which had evidently succumbed to wounds received in battle. The horns measured 44½in. and were perfect in every way. The carcass bore evidence of having been pulled about by a bear. Henry deplored the fact that the stock upon his farm were becoming so unruly.

"It was just about here," said Henry, "that one of my moose and a bear got in a snarl two winters ago. I was coming over from Renous on snowshoes, and I saw the track of a moose pursued by a bear. There was hair scattered along in places where the bear had clawed the moose on the run. By and by I came to that little spruce knoll yonder, and to my surprise Mr. Bear was up a tree, looking mighty sick. The moose had turned on him just there, and made it so hot for him that he took to the tree and was in such a hurry that he never stopped till he got to the top of the tree. I dropped the bear out of the tree with my gun. If I could have overtaken the moose I'd have given him a feed of oats."

We landed and went over to the edge of a small barren a few yards away, and Henry gave a call. He had hardly lowered the horn from his lips when we heard two shots fired away down the Deadwater. There could be no doubt that Dave and the ramcat had sailed into action. Dave had with him Henry's express rifle as well as his express injunction not to fire at anything unless he had a sure enough chance for a fine set of horns. We decided to postpone our calling operations and proceed to the scene of war. We saw no sign of Dave until we approached the landing in front of the camp, where he was just in the act of beaching the ramcat.

Dave was not in a cheerful frame of mind. He said that while passing a point known as the Island, which rivals the Jaws as a crossing place for game, he was confronted by a large bull moose. The ramcat apparently had no terrors for the moose, for he stood in the thoroughfare, shook his horns at Dave, humped up his back and emphasized his disapproval by snorting "ooff! ooff!" Dave reached for the rifle, fired and missed. The moose then stepped out on the point of the Island and threatened to shovel Dave into the water. Dave had serious thoughts, he said, of ramming the moose with the ramcat, but concluded to try him again with the rifle, this time at a range of about 40ft. He fired and apparently missed, for the moose, with a final "ooff! ooff!" deliberately crossed the Island and walked into the woods. Now, Dave is a man with plenty of pluck and experience: he has frequently shot moose under difficult conditions; how he came to punch holes around this particular moose he is entirely unable to state.

At daybreak Henry and Dave started for the big tent, to bring over more supplies and to spot a line for swamping a road to Fullerton's works by which to take out the moose head. Fred and I agreed to meet them at 4:30 at the head of the Deadwater. We put in the day idly drifting around the stream, reached the rendezvous at the appointed time, waited until after dark, saw no signs of the men and returned to camp, threading our way safely down the Crooked through the pitchy darkness. We heard the moose grunting and roaring as usual on all sides of us.

Next morning Fred and I paddled up as far as the Jaws, where I remained and amused myself watching the big trout fanning themselves in the pool below the run, while Fred kept on up stream in search of Henry and Dave. Luckily he met them just as they reached the stream with their packs and they all returned to the Jaws. As it was then 12 o'clock, Henry shoved the canoe ashore below the Jaws at the junction of the west branch and the main Deadwater and prepared to "bile the kittle." Fred and I were sitting on the shore discussing the silver question when suddenly the guide appeared and said: "Moose! moose! I heard him grunt twice right across the branch."

We hustled through the hardhacks until we reached a point opposite where Henry said the grunts came from and hid behind the tussocks. Henry called and was answered twice from the woods on the opposite bank, the noise being different from anything I had ever heard proceed from a moose, and resembling a blast of steam from the safety valve of a locomotive. In less than a minute a cow moose and calf emerged from the firs and walked out on the narrow strip of barren that lined the shore. We expected to see the bull loom up next, but he failed to appear. Henry said the bull was there all right enough, but probably had another mate, and the cow we saw was running away from him. It was a case of Hagar and Ishmael, and they were on the move. We noticed that both the cow and calf wore the neck ornament known as the bell, and it gave the latter a look of sagacity much beyond his age and size. They walked leisurely along the shore in plain sight of us for about 50yds., the cow looking back occasionally as though in fear of being followed, then silently forded the stream to the side we were on and trotted off through the brush. It was a sight worth coming many miles to see. Of course, the camera was at the camp.

After dinner Fred elected to return to camp with Dave, and Henry remarked to me: "Suppose we take a stroll over the farm."

Such a stroll and such a farm! For three or four hours we tramped over ridge and lakeside and barren, almost every acre of which exhibited fresh signs of game. Once we heard a crash in a thicket of alders, and found where a family of moose had taken flight. It is one thing in a densely wooded country like this to find fresh signs of game, it is quite another to see the game line up complacently in front of your gun. Henry referred to a statement he had once seen in FOREST AND STREAM to the effect that moose never peeled the trees upon which they feed clear around, and thus did not kill the tree. He pointed out several maples, mountain ash and sapling birch from which the bark had been stripped off completely round. The favorite browsing trees of moose, he said, were whitewood, moosewood, willow and cherry; they will, however, eat any kind of hardwood and most of the evergreens, especially fir. Spruce or cedar they will not touch unless hard pressed by hunger. He had never discovered that moose ate any kind of grass except a thin, flat grass that grew principally in the beds of streams or ponds or in marshy ground. It is sometimes called deer grass. Moose will often go clear out of sight for it in the water and remain under a surprising length of time. At two of the lakes we visited Henry gave a casual call, but received no answer. We saw the "works" of a moose, however, near the west branch which Henry said were made by a specimen even larger than the one we had shot. On our way to the Jaws we heard a partridge drumming. Henry said when this was heard in the fall of the year it was a sign of wet weather and a late open season.

On the 29th Fred went up the stream in the morning with the guides, while I patrolled the trail leading to Henry's camp on Little Sou'west Lake. Half an hour after their departure I heard a shot, which could only mean that Frederic had uncorked the Harbinger. I was watching a very promising pond at the time, and delayed my return to camp until the dinner hour. There I found, pinned to the blanket door of the camp, a diagram very cleverly drawn on birch bark by Fred in the Indian picture language, indicating that he had shot a moose. Soon afterward the canoe arrived and I learned what had happened.

Just above the Island they had heard a moose grunting in the woods near the western bank. Henry turned his canoe down stream so as to get to leeward of the moose, and paddled cautiously up a long, narrow bogan that made into the barren. His first call was promptly answered, and as they reached the terminus of the bogan they could hear the moose coming. Two men with axes, Fred declared, could not have raised a bigger racket. Fred stepped out of the canoe and stood upon a tussock.

"Now," said Henry, "if I get a frog in my throat we're ruined."

Henry then gave the low call or coaxer, and the bull promptly appeared through an opening in the firs. He was clearly in the best of spirits, and as he swaggered toward the bogan hooked the bushes first with one horn and then the other. At a range of 75yds. he stopped and gazed with unfeigned astonishment at the apparition of Fred and his indigo Mackinaw shirt. As Fred let loose the Harbinger the moose turned sharply to the left, and for a moment was lost to sight; but when Henry rushed through the bushes he found him lying dead not more than 30ft. from where he stood when the shot was fired. The bullet had pierced his heart, lungs and liver, and lodged in the rump close to the hide. This moose was about two-thirds the size of No. 1. His horns, which had fourteen points, measured 43in. across and were perfect in every respect. Henry, as usual, jacked the meat up so that it would be available for future use. With the warm and uncommonly wet weather that prevailed, the preservation of our meat proved to be a difficult matter. Portions of both carcasses were brought to the camp and smoked.

On the afternoon of this day I watched at the Jaws for caribou. These animals, while we sojourned at the Crooked, seemed to be few in number, or else too wary to show themselves. A good moose country is seldom a good caribou country, as the moose drive the caribou out. Toward sundown, as Henry and Dave were nearing the Jaws with the canoe, the noise of the paddle evidently attracted the notice of a large bull moose on the right bank. He grunted frequently and showed a disposition to come to the shore. It would have been an easy matter for Henry to have called him and for me to have shot him from the opposite shore, but we had decided to kill no more moose. We had each a fine set of horns to take home, and the difficult task still remained of cutting about three miles of road by which to carry the heads and scalps to the Fullerton road. Fortunately our carrying crew was reinforced that evening by the arrival at the camp of a man named Fred Swift. A Vermonter by birth, Swift had been spending his time for some weeks past in the precarious occupation of "gumming," or gathering spruce gum for the American market. He was a fine, strapping young fellow, quick to learn the "lay of the land" in a new country, and readily agreed to help us out with the heads.

The remainder of our stay at the Deadwater was uneventful. Douglas and Swift were employed for several days in cutting out the trail and Henry often lent a helping hand. It might be mentioned that as Henry officiated on the trip as cook, and as our appetites were not of a delicate sort he had not much time left for hunting. He was also greatly handicapped by wet and windy weather. However, we had been fortunate enough to secure our two moose with very little expenditure of time and effort, and this left nothing to be desired. Commencing with Sept. 30 it rained almost continuously for a week, not heavily as a rule, but hard enough to confine us most of the time to the vicinity of the camp. So ended our gun-boat days on the Crooked.

On Oct. 1 we moved back to the small tent, where we tarried for five days, taking occasional cruises to some of the surrounding lakes for photographic purposes when the weather would permit. We often started moose in our wanderings, but made no effort to add to our trophies. One of the most enjoyable of these trips was over to Lost Beaver and Renous lakes, where we saw beavers at work and where Fred succeeded in taking the picture of a saple in a tree. We shot a few partridges nearly every day for the camp larder. This bird has many foes in the deep woods, and finds the shotgun a far less formidable foe than the owl, the blue hawk, the saple, the fox, the skunk and the weasel.

One of our chief sources of amusement while in camp was that precocious rascal, the Canada jay or gorby. Fred conceived the idea of trapping some of these birds and trying to domesticate them, and he succeeded, by means of a box and figure four, in capturing no less than seven. Such was the gorby's greed for grub that immediately upon being taken from the trap and held in the hand he would seize any food that came within his reach, and as he struggled for a time against the bars of the cage he seemed to be unable to decide whether the chief aim of life was to escape or to carry off the pork that was in the cage. Fred had great hopes of making a success of gorby culture, but what with the wet weather, the filthy condition to which the birds soon reduced the cage and the severe shaking-up they received on the portage they soon became reduced to a caricature of their former saucy selves. On one occasion the cage slipped from the load and rolled down a hill. Henry said, as he looked at them: "Well, I did not think I could ever get up the slightest particle of sympathy for a gorby, but I'm hanged if I don't feel sorry for them." So Fred opened the cage and let them go. They were unable at first to fly in their dazed and bedraggled condition, but even as they hobbled off, squawking and chattering through the brush, the instinct of seeking to devour everything within their reach still remained with them. Henry maintains that a Canada jay has no feathers. He says, "It's just a kind of a fog that sticks to them."

On the afternoon of Oct. 7 Mr. Hunter and the bull moose express reached us from the outer world at the lumber camp on Forty-nine Mile Brook, and as he had secured another and a better horse in place of the sorrel we had a speedy and altogether pleasant journey to the settlement. We did not succeed in laying low the famous Tim Lynch, the monarch of moosedom, whose throne is somewhere in the region of the Crooked, but we did succeed in bringing out two heads that have not been equaled, it is said, by any hunting party in New Brunswick in recent years.

FRANK H. RISTEEN.

NEW BRUNSWICK.

CHICAGO AND THE WEST.

Fair Disciples.

CHICAGO, Ill., Oct. 29.—At the Calumet Heights Club, of Chicago, whose grounds are along the Lake Michigan shore and in the region of the famous Calumet system, there is more fun to the square inch than anywhere else on earth. At the close of each week three or four dozen members gather there and put in a day or two at unmitigated and unlimited enjoyment in shooting, fishing and living. Among the devotees of the rod and gun in this popular club are many fair disciples of the art of wing and trap shooting. The fever of shooting, it seems, is extending to the gentler sex, and they take little urging to lay aside the needle and take up the gun. A few days ago, the morning of the heavy snowstorm which was mentioned as having surprised this part of the world, Mrs. Elbert Gould, of the Calumet Heights Club, was at the club house and determined to have a duck hunt, just like a man. She arose at 4 o'clock in the morning, donned suitable shooting costume with rubber boots, took gun and shells, and departed in the gray of dawn after the time-honored fashion of duck shooters since time immemorial. She chose her own point of the river shore, getting into her blind in good season. There was a little flight, and Mrs. Gould actually bagged three teal to her own gun, all killed flying in regular style. Her return to the club house was in the nature of a triumphal procession, and so elated was she at her good fortune that she declared she was going to start at once for the city with her ducks and show them to her friends forthwith. This is the largest bag of ducks to a lady's shooting at this club this fall.

Mrs. Gould is not alone in her ability to kill a duck on the wing. Miss Erwin killed a big fat mallard all by herself, and on the wing, as it crossed a point not far below the club house one day this fall, and came in holding it at arm's length by the bill, exulting very much over her good fortune. The wife of the club keeper, Mrs. Starr, killed a pintail on the wing not long ago, and her daughter also has killed her duck, but confesses honestly that she shot it on the water and not flying. All of these ladies and others shoot at the trap and make creditable scores, and it is not likely that any other organization of this city can produce so many lady members who are entitled to the name of wing shot.

No one has had a great deal of shooting at the Calumet Heights ground this season, and no one seems to have worked very hard for it, it being preferred to loaf and have good times taking it easy. Messrs. Patterson and Lamphere on a joint trip last week got the mixed bag of three teal, one mallard, one widgeon and one bluebill. Rifle shooting is much practiced at this club and a number of long-range rifles are kept there by members, the sand beach offering one of the best rifle ranges to be found anywhere adjacent to Chicago.

Bags of Ducks.

The present season has been the poorest for ducks of any known here for a long time, and no good bags are mentioned by any one. Probably the best local bag was made by Messrs. A. P. Harper and F. S. Lewis, who were down at Water Valley on the Kankakee the day of the storm. They put their boat on a wagon and drove to the Brown ditch, and pulled into a hole where the birds were crowding in out of the storm. They got sixty ducks together, and also got a good wetting by means of a capsize from the boat. They shot together, and to get a better seat had chairs arranged on a board on top the deck of the boat. As they swung after a flock of mallards that passed the recoil of the guns upset them into the mud and water, and gave them a good bath.

At Water Valley Sam Booth, of Chicago, had a duck hole all picked out, and his pusher, Dick Cox, watched it for him, one day going and getting twenty-five birds there himself. When Mr. Booth came down to shoot, the birds were feeding at a hole above there, and the two went up to that place to shoot. Then they saw the birds begin to drop in behind them, at the place they had left, and went back to see how it would go again. The flight thereupon stopped entirely, and they got only a very few shots the rest of the day.

Messrs. Geo. Marshall, J. Morgan, of the Chicago Metal Boat Co., and their friend Mr. Prickett had a camp hunt last week on the Kankakee, at a point below Water Valley and nearly half way to Momence, they expecting to get some duck shooting. In this they were disappointed, but they got about three dozen jacksnipe, which pleased them almost as much.

Messrs. John Cody and Mike Begley, of Chicago, went up to Peckaway Lake, in Wisconsin, a week ago and happened to meet the flight. Mr. Cody to his own gun got ninety ducks, and reports the sport all that any man could wish.

Mr. Cody's success was the best I have heard of in this region, and indeed the heaviest shooting I have known anywhere in the country. Two Milwaukee hunters, who went to Melette, S. D., had good shooting three weeks ago, getting eighty ducks in one day at some lakes near there. I could not get the names of both these men, but was told that one was Mr. Leidersdorf, of that city. My informant advises me that there was very good chicken shooting this year at points near Melette. In the same indefinite way I hear that a club of Dubuque, Ia., sportsmen, who go every year to the North Dakota ducking grounds, this fall went to a point west of Jamestown, probably Dawson, and had extremely fine sport, bagging 800 ducks and geese. They made a large party, about twenty men, as I was told.

Mr. F. A. Howe, the veteran and beloved president of the Tolleston Club, of Chicago, has this season not had as much sport at his favorite grounds as he could wish, but one evening went out and bagged twenty-one ducks, a very decent bag for a place only thirty miles from the city. Mr. Howe is one of the oldest shooters of Chicago, and one of the most respected, and his favorite form of sport is shooting ducks.

A friend tells me that he saw a shooter from Koshokonong Lake last week who was just coming home from the depot in a cab at the close of his visit to that famous lake, and in this cab he had actually in hand a bag of thirty-six fat canvasback ducks, the product of one day's shooting. My friend could not give the shooter's name, as he was a stranger; but there was no doubt about the ducks, and he said they did look mighty nice.

A Grand Texas Trip.

Mr. Jos. Leiter, of this city, with a couple of Eastern friends, will start about Nov. 13 for a notable duck trip to Texas. They take a steam yacht from New Orleans and skirt along the Gulf coast of Louisiana and Texas, making a voyage of over two months on the best wildfowling country left in the United States. The yacht is now on its way to New Orleans from New York city, and all the outfit is purchased. At Van Uxem's, this city, I saw a pack of five of Dan Kidney's best push paddles, which go aboard the yacht. Best of all for the success of the party's effort at getting ducks, the entire party is to be under the guidance of the famous duck slayer, Billy Griggs, known in these columns through description of shooting had with him in Texas, near Galveston. If anybody on earth can get ducks it is Billy Griggs, and it is a very fine prospect that is ahead of these cruisers in the summer seas of Texas. Billy Griggs is now in this country, and yesterday went to his home at Browning, Ill., on the Illinois River. He will return here next week, and finish plans for this trip with Mr. Leiter's party.

Numbers of Wisconsin Deer Hunters.

To-day I saw members of the general passenger department of the Chicago, Milwaukee & St. Paul Railroad, and asked what was their opinion on the amount of traffic they would pull into Wisconsin for deer hunting this fall. The reply was that they considered the season practically lost by the late trouble in the deer law, and thought they would not carry more than a few hundred shooters into the region. They had contracts made for a number of very large parties, some numbering over fifty, most of these parties coming from the same old precincts of Ohio and Indiana, but nearly all had now given up the trip. It is a singular thing, but all the roads regret that the great majority of the deer shooters come from Ohio and Indiana, the men of those States having apparently a great predilection for this form of sport.

When asked how many deer hunters the road carried into Wisconsin last year, the representatives of the Milwaukee & St. Paul said that they thought they took over 1,000 and perhaps nearly 2,000 to the pine woods of Wisconsin last fall for the purpose of deer hunting. They thought it quite within bounds to say that there are 6,000 deer hunters in the Wisconsin country every fall—possibly more than that. This I am quite disposed to think the case, for thus I have statements from two railroads which alone took nearly 4,000 men there last fall. This leaves out all the other railroads, all the unknown parties who bought tickets and left no record, and all the

resident deer hunters. These figures are very large and very interesting, showing as they do what an industry even a single line of sport may becomewhen developed and defined.

The end of this week will close the deer season for 1896, and it is safe to say that the deer will be much increased in numbers by the hitch in the law.

Messrs. Walter Dupee and C. S. Wilcox, shooting from the same blind on Horicon Marsh last week, got eighty-seven ducks one day, and on the next morning bagged twenty-one before 9 A. M. This is top bag for that locality so far as known.

Mr. Dupee was at Swan Lake Club just before the late warm spell struck this region, and though the birds had been in there by the hundreds, he had to bear the sight of their getting up and going elsewhere, back to the North, as he supposed.

L. R. Brown got sixteen ducks at Maksawba one day the past week, the highest bag one remembers for that club this fall.

It is believed by old duck shooters of this country that the ducks are changing their habits and before long will feed almost entirely at night. This would make duck shooting even more difficult, but is a natural result of the constant harrying the birds have all the time.

Personal.

Mr. R. B. Organ, of this city, well known among shooters of the country, goes to New York and a number of New England points on business week after next and will visit friends in the East.

Mr. W. P. Mussey, of the sportsmen's rendezvous, the well known billiard hall at 106 Madison street, is lying at home sick at this writing, and will hardly be down at business for some days. Hunting on the Kankakee marshes gave him an attack of fever and ague, which threatens to turn into something worse by way of fever. His friends hope he will not be long confined to his bed, but may shake off the indisposition, so to speak.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

CONFESSIONS OF A DEERSLAYER.

IT is unfortunate that the candid individual who signs the name Deerslayer to a communication in this week's FOREST AND STREAM should have suppressed his name. We would like to exhibit the sportsmanlike prowess of the owner of the name to an admiring world. He thus laments the probability of more restrictive laws this winter designed to regulate the practices of human fiends like himself:

"Now that the season is nearly over and our lawmakers will soon commence business again at Albany, there seems likely to be a strong effort to enact more laws to restrict the sport of deer shooting in the Adirondacks by prohibiting jacking and hounding, because it is claimed that the game is becoming scarce and needs protecting. Such things are always urged by a lot of fancy shooters, with their high-toned ideas of still-hunting, wing shooting, long range rifle practice, etc., and not by real, old-fashioned hunters, who go out for game and want a fair chance to get it."

This cheerful assassin is opposed to all measures which might restrict his sport. Here is his idea of "sport:"

"Of course we go at it in a scientific way and with the best of appliances. Our boats are light and swift, our guides are men of experience, and our dogs are trained to drive the game to the water. We start the dogs out in the morning, and then sit around in comfort and wait until the 'music' comes our way, then jump into the boat with a guide and watch for the deer to come into the lake. Soon he dashes in and starts to swim across, and away we go as fast as a pair of oars can drive the boat. The excitement of such a chase is intense, and only big game hunters enjoy such sport. Overtaking the straining buck, the guide drops his oars, and with a long, forked sapling and a bit of rope deftly slips a noose around the head, and then the good old 10-gauge gun, with a charge of buckshot, makes the supply of venison sure. It is great sport and no error; and the man who is cool-headed and a fair shot is sure to kill the game. Why, my boy, who is a chip of the old block and only twelve years old, killed his deer the first time he went out."

There could be no more powerful argument for the enactment of laws for the prohibition of inhuman practices in deer hunting than the bland confessions of the diabolical Kurd who writes this letter. It is nothing but the presence in the woods of such creatures as this, whom an inscrutable Providence permits to live, that makes stricter regulations necessary. The true sportsman is a gentleman. His idea of sport is that which has characterized venery in every age; to match woodcraft and skill against the keen scent, the intelligence and fleetness of the hunted animal; to give the quarry a fair chance for its life, and to bring it down, if at all, by one of those "long range" feats of marksmanship which this deerslayer affects to despise. For such "high-toned" sportsmen no restrictions whatever would be necessary. But when a brute like the correspondent of FOREST AND STREAM finds "noble sport" in hounding a deer into a lake, chasing him as he swims until the animal is exhausted, getting a guide to lasso him with a noose and hold him quiet while the "sportsman," at 3ft. distance, fires a charge of buckshot into the deer's panting body—it is for such butchers that laws are enacted, and against such that the laws must be enforced.

For four successive sessions *The Mail and Express* has caused to be introduced, and has strenuously and persistently advocated, a bill to prohibit the killing of deer, either from boats, by the practice known as "jacking" or "floating," or by chasing and killing the animals while swimming in the water. It has been a long fight, and against a powerful lobby composed largely of "Deerslayers" and their abettors and entertainers, and the fight is not yet ended. Last year we scored a partial success, that is, the legal season for "jacking" was cut down from ten weeks to two. Senator Malby, Assemblymen Sanger, Laimbeer, Husted and others made a brave fight for the total prohibition, but were compelled to accept a compromise which gave them so nearly what was sought by the friends of game protection.

But this is not enough, and the fact that the Adirondack forests are still infested with gangs of deerslayers of the type of the correspondemt of FOREST AND STREAM makes it necessary that the next Legislature should abolish entirely not only "jacking," which, while destructive and unsportsmanlike is still indulged in by gentlemen, but it should also put a stop to those atrocious butcheries in which "Deerslayer" and his precocious cub so delighted themselves. Such a bill will be introduced early in the next session, and we shall ask of FOREST AND STREAM, and of the intelligent and humane press throughout the State, to give it their hearty and vigorous support.—*New York Mail and Express.*

SUNDAY SHOOTERS IN RHODE ISLAND.

PROVIDENCE, R. I., Oct. 26.—*Editor Forest and Stream:* Throughout this State the Sunday gunner is not regarded with favor. There is a law which makes him subject to a fine, and several successful prosecutions have been made under its provisions. Just at this present season the matter is being agitated, and the better class of sportsmen are in favor of a more rigid enforcement by the constables of the towns and the police. In rural towns there is no doubt about the strength of the sentiment against the man who shoots on Sunday, for many of the farmers are of the church-going class. The General Laws read, Chapter 110, Section 3: "Every person, not being at the time under military duty, who shall discharge any rifle, gun, musket, blunderbuss, fowling piece, pistol, air gun, spring gun or other small arms, or any contrivance arranged to discharge shot, bullets, arrows, darts or other missiles, except upon land owned or occupied by him, or by permission of the owner or occupant of the land on or into which he may shoot within the compact part of any town or city, or not being at the time on military duty, shall anywhere discharge any of such arms or contrivances on Sunday, shall be fined not exceeding $20."

This matter should be looked at not only from a Sabbath standpoint, but also from the point of view of the true sportsman. The game is not over plenty and in the open season is worked pretty hard by the hunters, and in behalf of legitimate sport it will be found to be advisable to give the birds one day's rest in the seven. Yet another point in the enforcement of this Sunday law is that the Sunday gunner is, as a rule, a man who knowingly violates this law, and one, moreover, who will shoot at any season, in defiance of the close law; so that he is deserving of but little sympathy on the "only day" plea. More than this, he is robbing the man of sport who does observe the law and does not shoot on the Sabbath. The prominent clubs that are interested in shooting and the preservation of game are heartily in favor of this provision, and next season it is hoped to make Sunday a "close day" on game birds by the enactment of proper legislation.

W. H. M.

FOREST PRESERVE RESOLUTIONS.

AT a largely attended meeting of the Brooklyn Democratic Club Thursday, Oct. 29, Hon. Harrington Putnam presiding, the following address, presented by A. H. Eastmond, was unanimously adopted and issued to the voters of the State:

The Brooklyn Democratic Club, always zealous for the welfare of the people, now appeals to all citizens, irrespective of party affiliations, to vote against the proposed amendment to Section 7 of Article VII. of the Constitution of the State.

In the Constitutional Convention of 1894, but thirty-three proposed amendments were deemed worthy of adoption, and that relating to the protection of the State forests was the only one unanimously adopted.

We invite the careful attention of all voters to the following facts:

First—That the adoption of the amendment permitting the leasing of the land within the State forest preserve will lead to the destruction of the timber, the selection by clubs and a few wealthy individuals of the choice locations, to the exclusion of the public.

Second—That the only advocates of the amendment are those actuated by selfish motives in securing parcels of these lands for their private gain.

Third—That the preservation of the forest is absolutely necessary to the agricultural pursuits of the State and the industries that depend upon the canals and rivers for transportation. The destruction of this great watershed will rapidly decrease the supply and force of water throughout the State, thereby increasing the danger from fire and the cost of insurance.

Fourth—That the amendment now submitted to the people was considered when the whole subject was before the Constitutional Convention of 1894, and was then defeated on its merits.

Fifth—That the selfish projectors of this amendment have selected a Presidential campaign in which to bring it before the people in the evident hope that the unsuspecting public's attention will be diverted by the important questions to be settled, and vote "Yes" upon a question upon which they are not informed.

The Brooklyn Democratic Club trust that when the people are made aware of the bidden purposes of this amendment they will not fail to mark an X in the "No" square in the ballot reading: "Shall the proposed amendment to Sec. 7 of Art. VII. of the Constitution, relating to forest preserves, be adopted?"

News from the Nation.

LOCO, I. T., Oct. 23.—*Editor Forest and Stream:* The weather remains very dry here, and we shall have no duck shooting to mention, although there are occasional flocks passing over every day. A few geese are stopping on the prairies, but they are so wild that it seems useless to try to shoot them. I was out on Saturday last with a companion after quail. The cover is so dense that one's percentage runs very low. The birds were all found in the cornfields, but sought the thickets immediately upon being flushed. We only succeeded in bagging thirty-two, twenty-four of these falling to my 16-gauge Parker.

I am informed that we at last have a law that will afford all the protection necessary to our game here. It is strictly a non-export law, and I have no doubt it will be vigorously enforced. It is likely the work of the several gun clubs hereabout, and while it will prevent any visiting shooter carrying any game out with him, it will not hinder anyone from coming here and having a good time camping and shooting. (I inclose clipping from a Denison, Texas, paper, giving the essential points of this law.)

An idea of the depletion of game birds here may be drawn when I tell you that one day last week the marshal at Duncan liberated thirty-seven dozens of quail for one lone netter. This has had a telling effect on netting here.

L. D. W.

The Chickasaw Legislature has just enacted a very stringent game law that will knock hunters out. The law provides that no person whomsoever shall be permitted to go to the Chickasaw nation and kill any game whatsoever and carry, ship or convey it beyond the boundaries of that nation. No person whomsoever shall kill, net or ensnare any game whatsoever only for the immediate necessities of the person or persons named. This law goes into effect at once and the punishment for breaking it is a fine of not less than $25 nor more than $100. The terms of the law are such that all manner of hunting in the Territory where the game is to be shipped or carried away is positively forbidden.

That Moose.

THE pleasures of life are all in the anticipation. Any one will acknowledge that the anticipation of killing a moose is way ahead of the reality. Consequently the man who has gone moose hunting and failed to bag his moose is a happier man than the one who meets with success, for he may still enjoy the pleasure in anticipation.

Mr. G. H. Haulenbeek, who is head of one of the most successful advertising agencies in New York, is confessedly of this opinion. He has returned from Maine without his moose, and should not be a bit sorry that the world still contains for him an exquisite sensation with which he is not familiar.

Besides Mr. Haulenbeck, the party consisted of George F. Durgin, of Concord, N. H., and R. T. Supple, of Middleboro, Mass.

For guides they had Arthur Hackett, Algy Spearin and Frank Chase.

Their headquarters were on Spider Lake on the Allaguash watershed, three days' journey from Ox Bow up the Aroostook River, via Munsungun, Chase and Echo lakes. They had to combat a swift current most of the way, and setting poles were in constant use. They saw a great deal of fresh sign, but the rainy weather which characterized the first part of the season this year ruined their sport.

Up on Leadbetter Pond the tracks of moose and caribou were so thick that the shores looked like a well-traveled towpath or the floor of a pig sty, and when coming back over carries at night they frequently saw the tracks of large moose that had traveled the carries since they had passed in the morning. Deer were abundant, and when the party returned to the railroad they saw several moose that had been killed. In Mr. Haulenbeck's opinion there is better hunting nearer the railroad than way back in the big woods.

"Why, we took the best part of two weeks going and coming," said he, "a length of time that would have been amply sufficient to put us on hunting grounds in the Rocky Mountains, and saw no moose; while, on the other hand, plenty of moose were killed right on the railroad. I am going up again in December for a moose, but this time I shall take a place that is easier of access." B.

New Brunswick Game.

THE Rev. E. A. Slack and E. B. Holmes, Esq., of Brookline, Mass., were in St. John on Friday on their way home from the hunting grounds of the Miramichi. Both gentlemen were in the best of humor. They were able to show as a result of a few weeks' cruise not only well-browned countenances and a generally rugged appearance, but they also brought with them the largest pair of moose horns which ever left that part of New Brunswick. They had each equal luck, each killing two bull moose and three caribou, and they were greatly charmed with this part of the country.—*St. John Globe, Oct. 17.*

It is to be hoped that Mr. Holmes or Mr. Slack will favor the readers of FOREST AND STREAM with some account of their adventures. They may fairly claim to have broken the record on New Brunswick big game. They had with them the well-known guide, Arthur Pringle, who would appear to have at his disposal not only the finest caribou grounds in this Province, but an excellent moose country as well. It is said that the two largest moose were adorned with horns measuring 54 and 51in. respectively; that one of them required seven .45-90 bullets to give him his quietus, and enlivened the proceedings by charging his foes, while the other after four bullets went away and was accidentally found lying dead in a lake three days afterward. All of this ought to make very interesting reading if set forth in detail in the comely pages of FOREST AND STREAM. But what do the people who favor pop-guns for moose think of the above additional evidence of the insufficiency of the .45-90? A well-known sportsman gave me a harrowing account recently of his efforts to kill a bull moose with a .40-44 repeater. He emptied twelve shots into the animal and then had to go to camp for more ammunition. He got his moose, but he wasn't very proud.

FRANK H. RISTEEN.

FREDERICTON, Oct. 26.

Maine Big Game.

BOSTON, Oct. 30.—Mr. E. Frank Lewis, of Lawrence, is again out of the Maine woods from his fall shooting trip. He was hunting about three weeks, and brings home his full legal quota of two deer. He was accompanied by Mr. Homer Sayer and another friend or two. They went to their usual camp, to Lincoln, on the Aroostook Railway, and from thence to Lee. Mr. Lewis's daughter was the first lady to bring out a Maine deer this season, and while in the woods had an experience not usually falling to the lot of women. The gentlemen of the party were ahead, following up an old tote road, Miss Lewis and a lady friend were following behind a half mile or more, and the tote sled with their camping outfit was behind the ladies. Looking to one side, they beheld, but a few rods away, a huge bull moose, with tremendous horns, eyeing them closely. To say that the ladies were frightened only half expresses their sensation. They stopped, and suppose that they turned pale, though no one was near to accuse them of this womanly weakness. The big fellow stood his ground till the team came up, and even then moved rather deliberately away. The ladies were unarmed. This time Miss Lewis did not have her hand camera, for it was on the sled, but the desire for it was great. The moose stood in a very fair light, and would have given some excellent snap shots.

The accounts of big moose slain begin to be more frequent. A Bangor report says that Dr. Grey, of Lynn, has secured the largest moose antlers on record. The moose was shot in Aroostook county, and brought to Bangor to be mounted. On one of the antlers there are twenty-one points, and on the other seventeen points. It is said that the antlers belonging to the Prince of Wales, which are now the second largest in the world, have sixteen and eighteen points. The length of the blades of the antlers of Dr. Grey's moose is 3ft. 2in., and each is 15in. in width. The spread of the antlers is 57in.; not a very remarkable measurement. Dr. Jones, of Lynn, was with Dr. Grey, and also brought out a moose. SPECIAL.

The FOREST AND STREAM is put to press each week on Tuesday. Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

Ducks in Barnegat Bay.

BARNEGAT INLET, N. Y., Oct. 29.—At the present moment there are more ducks and geese in Barnegat Bay, in the vicinity of the Inlet, than has been known for many years past, and best of all they are of good quality, red-head, cub-head, widgeon, teal and broadbill, and in excellent condition owing to the abundance of young mussels and other food. For several days past I have seen an almost unbroken line of wildfowl, "bedded," as we call it, from abreast of Cedar Creek to the Clam Islands. Tens of thousands would feebly express their numbers, I might better say solid acres of them.

Occasionally, as a passing boat approaches them, they rise in clouds, and as they wheel and turn in the sunlight the flash of their breasts and wings are bewildering and beautiful to look upon. It makes the gunner rub his hands and think of what sport there is in store for him as soon as the wind freshens. The Great Sedge Islands are certainly getting their share of the sport this fall, as I have talked with several parties who have gunned from these points and have seen their bags too, and all report fine sport and ducks of good quality.

At Harvey Cedars they report only fair sport, as the birds are at present out in the bay or bedded to the east of the Sedge Island and north of Buster Island. Geese are arriving daily in flocks of twenty-five to seventy-five and soon we shall have fine sport with these noble fellows. Brant are rather backward in making their appearance this fall, as I have seen and shot only a few to date. Very few canvasbacks are shot here, but I saw two last Saturday which were killed by a Mr. Culbert, of New York, from northwest point on the Great Sedge, near the Inlet. SEA DOG.

Long Island Deer Shooting.

DOWN on Long Island the deer season opened Wednesday with a salvo of artillery. With a good strong east wind blowing the noise of battle might be heard almost to New York. Travelers unacquainted with the cause no doubt ascribed a political significance to the muttering reverberations that shook the heavens, but even a Presidential election is of slight consequence to Islip and Hauppauge, Smithtown and Ronkonkoma, Stony Brook, St. James or Patchogue compared with the opening of the deer season.

Long before daylight the hunters assemble, coming in ghostly train from all quarters of the compass. Their dogs are put on tracks found by lantern light, and with the first pink tinge of dawn the game is afoot. By sunrise the fun has become fast and furious, and guns are heard booming in all directions, now singly, now in vollies, till the brimstone smells to heaven and the dim cloud of battle envelopes the scene.

The hunting territory lies on three sides of the grounds of the South Side Sportsmen's Club and the lands belonging to Messrs. Vanderbilt, Roberts, Cutting and Fraser, which adjoin, and under the most favorable conditions is very limited in extent. All the lands named are posted, and this year the free territory is still further contracted on account of the closing to the general public of various tracts that formerly were open to all.

The Bohemia Club, the Fur, Fin and Feather Club, a hotel-keeper named Mucklewitz, and others, have leased the best portions of the adjoining territory, and appointed deputies to keep outsiders off. Already several arrests for trespass have been reported, and aside from the railroad track and public roads there are few stands open to outsiders. This means that the hunters will be more concentrated than ever, and that the danger to human life will be just so much greater than in former years.

Queer Things in Camp.

TEMPE, Ariz., Oct. 19.—*Editor Forest and Stream:* "What strange things we see, etc."

Have just returned from a six weeks' camping trip, during which we visited the Natural Bridge (said to be the largest in the world), the Ice Cave, the Cliff Dwellings and the Grand Cañon of the Colorado. We had plenty of venison—blacktail deer—turkey, antelope, squirrels and quail. I caught 140 fine trout. Ice caves and trout in connection with torrid Arizona may sound strange to many, but it is nevertheless true.

On the trip we met with a camping party who had a box of "silver gloss" starch. What for? we naturally asked. No answer, when the small boy came to our relief with "I don't know what for. It ain't good, though, 'cause pa tried it in his bread this morning."

We left them without finding why they had it with them.

One of the first things I did after getting settled at home was to pick up dear old FOREST AND STREAM. The first thing I saw was "A Moose Hunt in Maine," by Capt. Taylor. We note the Captain's menu: "2lbs. Kenso pilot bread, one-half bushel potatoes, * * * a flour sieve." In the name of all that's good in politics, what for?" If the good Captain will tell I'll try to find out why they had the starch. G. A. SCROGGS.

Game Laws of Newfoundland.

Editor Forest and Stream:

I see a notice of this in your issue of the 24th. The law as it stands is a farce, and if meant to hamper and keep out foreign sportsmen is likely to be successful. No sportsman of course cares to kill a stag unless his horns are hard. But he, the shooter, may begin to shoot on July 15 and continue until Oct. 6, when there is a close time till Nov. 10. The greatest nonsense was talked in the House of Assembly at St. John's as regards the rutting season and other habits of the caribou. As a fact, the horns of the caribou are hard about Sept. 7, and the rutting season begins about Sept. 15 and lasts till near the end of October. But in Newfoundland the big stags don't show up but rarely before the 4th or 5th of October, the best time to get them being from the 7th to 25th. But the unfortunate sportsman is stopped shooting on Oct. 7 and not allowed to commence again before Nov. 10, by which date the big stags have dropped their horns.

Then begins the wholesale slaughter by the settlers. A gun is also reduced to three stags and two does. Why not to five deer if he likes all stags? A more absurd bill has never passed into law. But then on the part of some people in Newfoundland there is a great jealousy of outsiders. RICHARD L. DASHWOOD.

A New Hampshire Side-Hunt.

LEBANON, N. H., Oct. 27.—It is the custom of our local sportsmen to engage in an annual hunt. Sides are chosen, and a day is spent in the woods and fields looking after the birds and squirrels. The hunt for this season occurred last week, and although the weather was very unfavorable for such sport the result was quite satisfactory. The following list of game was brought in: Four foxes, ten coons, twenty-one partridges, forty-six grey squirrels, five quail, one woodcock, one duck, two owls. New Hampshire has rightly gained the reputation of being an ideal summer resort on account of her grand mountains and beautiful lakes, but the tourist with a taste for sporting, who lingers until the autumn days, will not only enjoy the bracing air and fine scenery, but will find game enough to interest him in the old Granite State. W. S. C.

Back from the North Woods.

NEW YORK, Oct. 27.—*Editor Forest and Stream:* Fred Sauter's hunting party has returned from the Adirondacks, bringing with them four deer. Of these Valentine Schmitt killed two, F. Siegler one, and Fred Sauter, Jr., one. The party hunted at Paradox Lake and Johnson Pond, finding the best hunting in the latter neighborhood. Their headquarters were at Laymond's Riverside Inn, Severance, N. Y.

On their return Mr. Schmitt entertained a large number of his friends, including many prominent people, at a venison supper in his Brooklyn hotel. B.

Moose are Protected in Ontario.

DUNNVILLE, Ontario, Can., Oct. 26.—*Editor Forest and Stream:* Will you kindly allow me through your columns to ask your correspondent G. L. B., of Elizabethtown, N. Y., to go one better in pointers, and tell us where "Horace Braman, the well-known guide," has gone to in Ontario to hunt moose for a month? As we do not allow any one to kill or hunt moose in Ontario until 1900, we would gladly send one of our wardens up to help him.

DR. G. A. MACCALLUM,
Ontario Game and Fish Commissioner.

Wild Ducks Breeding in South Carolina.

SOUTH CAROLINA.—*Editor Forest and Stream:* Have any of your correspondents of the last two years noted that the mallard and black ducks are beginning to stay South all summer and breed in our large marshes?

We have noted it for three years, and increasing numbers about the mouth of Santee River and Wingate Bay, which is perhaps the greatest winter resort of these ducks in the United States, owing to the proximity of so many rice fields. E. P. ALEXANDER.

Vermont Grouse.

PUTNEY, Vt., Oct. 20.—I send you a picture which shows the result of a day's outing after ruffed grouse in southern Vermont, and while the string is not large it ought to satisfy any sportsman. The birds were killed over Mr. Willard's English setter Ned, only eleven months old. Grouse are very plentiful here, and a party of three with a good dog can easily bag from eight to fifteen or twenty in a day's shooting. W. E. AYRES.

Sea and River Fishing.

MEN I HAVE FISHED WITH.

XIX.—Antoine Gardapee.

(Concluded.)

THE Christmas sun was not too bright for a winter day and there was no wind. I was roused by the loud tapping of the great northern woodpecker on one of the logs of our house. This large bird is almost extinct to-day and few young men have seen it alive. Its length was 18in. and its tappings were in proportion. Antoine had been up some time and was smoking his pipe by the fire, for he was one of those who can smoke before breakfast. When he saw me up he rose and with a hearty shake said: "Merry C'ris'mas, I'll hope you'll be all well," and he prepared the breakfast. As I went to the spring to wash I looked at my unshaven face in its glassy surface and wondered what the good people at home would say if such an apparition should walk in on them, for we had no razors nor mirrors, and had been all winter in the wilds of Wisconsin, with only an occasional Indian visitor to look at us.

The spring near our cabin was the head of a bit of marshy ground which was so filled with springs that it never froze nor was even covered with snow, as it soon melted and drained off into a tributary of the Bad Ax. But on this Christmas morning of 1855 there was a woodcock feeding in that marsh. I saw it plainly, flushed it, and know that it was a woodcock. Those who have followed these sketches will credit me with knowing this bird when I see it. Why it was there is a question. It could fly well.

After breakfast, and the meditative smoking which seemed part of Antoine's religion, I thought of fleshing some skins, but Antoine said: "Let da skin res' to-day, all res', all man he res' on C'ris'mas; you doan do no work w en he come in you' home; no, sare, you doan do not'ing but res', all a peep' da res'. W'at you say, hey?"

"I say that I can't sit by this fire all day just because its Christmas, I wouldn't sit down that way if I was home among my people, I'd walk around, and if I'd been at hard work all the week I might go and spear eels through the ice. A live man can't sit like a lump on a log all day. There's no place to go here and these last skins want fleshing and I want something to do, that's all."

"You go spear da heel on C'ris'mas, hey? Well, he's all right in da hafternoon, but I go in da church on a C'ris'mas mornin', and mebbe I'll got drunk in a hafternoon, I'll doan work on no ole skin an' Ill doan spear no heel; on'y res'."

"Do you ever go to church any other day in the year, Antoine? I'll bet fifty mink skins you don't, and the chances are that you go to a dance on Christmas Eve and sleep all the next morning and don't get to church at all."

"W'at you talk? Did you say some prayer w'en you got hup dis mornin'? No! I'll bet nine or 'leven mink you ha'n't said prayer all da wint'. I'll count all-a my bead 'fore you'll git hup. I'll tole you I'll got s'prise wot make you' eye bung hout. Dat make no dif' w'en I'll go in da church, I'll show you some C'ris'mas dinna till you bu'st you' belt, you bet. I'll been look hout all-a wint' for see da day come w'en we res' an' heat jess lak' da peep' way down da riv' by Potosi."

Our food had been simple, but always in plenty. Venison, coon, bear, rabbit, partridge and fish prepared in several ways, as boiled, fried, broiled or roasted; and we had good bread, coffee, sugar and an occasional bean soup. The fat of the bear and the coon was as good as lard and often our stale bread was soaked and fried. So we had a good substitute for butter and lard, and the only thing that might have been lacking was the potato, which would be difficult to keep and was too bulky to carry. Surely this was good living for healthy men in a wilderness in winter. But from hints which Antoine dropped from time to time this profusion might not last. This was the first idle day of the winter, and as my partner had intimated that he was going to surprise me with a Christmas dinner I left him to arrange it and wandered out with my snowshoes and snow-blinders.

Heretofore I had always gone up the several little streams which formed the east and west branches of the Bad Ax River, where our traps were set. To-day I would go down the stream, which I had not seen since we brought our provisions up its valley in the fall. I had gone about two miles when a log invited me to rest. The winter landscape was beautiful; the bluish tints of the twigs against the sky and along the stream relieved the whiteness and the day was perfect. A rabbit came slowly jumping along and passed within 20ft. of my log and soon a fox appeared following its track, but took the alarm at several times 20ft. and trotted off over the hill, with an occasional glance over his shoulder to make sure that the man on the log was not following. I fell to thinking how animals differ, just as men do: one dull and unperceiving, and another alert and watchful. A child could have shot the rabbit, but only a rifleman could have touched reynard.

Then came a thought that food might be scarce with us, as what Antoine had said was recalled. As I understood the case, the deer were in "yards" where they had trampled the snow so that the crust did not cut their legs, and as they could not forage far they were getting poor. And these yards were some distance off, so that a special trip of twenty miles or more would have to be made to get venison. Bears had gone into winter quarters, and would not stir out for a couple of months. Partridges found food scarce, were poor, and were eating bitter buds, which made them unpalatable. Coons were laid up, like the bears, and there was a prospect of scant rations. Antoine said that some trappers ate the flesh of the pine marten, or sable, and the related species called pekan, fisher, black cat, etc.; but Antoine wouldn't eat them, and very naturally I refused them. I should think that a man would have to be very hungry to eat any of the tribe to which the mink and weasel belong. We do not care to eat the animals whose diet is exclusively flesh—such as the cats and dogs—whether we call them tigers or wolves, but the deer and the sheep are vegetarians, while the bear and the hog eat similar food, and we eat them. It looked as though we must live on rabbit and our present store of venison and bear the rest of the winter, and rabbits were not plenty.

While engaged in such thoughts a gray squirrel came in sight and I watched it run up a tree and jump into another, and then it stopped at a hole in a tall tree and seemed to want to enter it, and then appeared afraid and would draw back and then peer in again. The tree was an oak, and the hole was small, like a woodpecker's. I noted that the bark on it was torn, and as the sun was high I went back home.

"Hello!" said Antoine, "I'll t'ink you go got los', an' I mus' heat a C'ris'mas din' all 'lone. Jess in tam, an' glad for see you! *Bon jour!*"

We shook hands like old friends long parted, and he motioned me to my seat at table with courtly grace, and it began to dawn upon me that I was, for this occasion, not his partner, but his guest. He had prepared the dinner alone, as he had intimated he would, and he was host, *chef*, *garcon* and companion all in one on this Christmas Day in the wilds of Wisconsin. The first course was a soup of deer shanks with the marrow-bones cracked; but I will try to put that memorable dinner in the shape that some *chef* of to-day would put it, when it would be like this, with my translation:

MENU.

POTAGE.

Consommé du bois. (Deer shank soup.)

POISSON.

Saumon du font, au naturel. (Brook trout fried.)

RELEVÉ.

Tranches d'agneau montebello. (Venison steak with sweet sauce.)
Aqua pura. (Bad Ax water.)

ENTRÉES.

Poularde á la chevreuse. (Boiled partridge.
Haricots. (Baked beans.)
Vin du Bad Ax.

ENTREMETS DE DOUCEUR.

Pouding de ris au fruites. (Rice pudding with raisins.
Café. Tobac.

Now I ask you—I mean you sportsmen old and young—how does that seem to you for a Christmas dinner either in the woods or in the wildest restaurants of New York city?

Most of these things we had cooked in one shape or another, but never such a lay-out as that at one feed. The great surprise came with the rice pudding with raisins, for I had no idea that these things were in camp, but Antoine had smuggled a handful of rice and a few raisins among the things bought at Prairie du Chien for just such a treat, and the old man enjoyed my surprise. The whole dinner was a surprise, for that matter; but the rice and raisins, well, they more than filled the bill. The "tobac" was burned by the fire, and after such a gorge we laid ourselves down and slept until dark.

We were awakened by the entrance of Ah-se-bun, the raccoon, who accepted the invitation to dinner, and he not only cleaned up what we had left, but he put a polish on every bone until he could work no more. There was a big lot of the rice pudding left, but when he finished the last of it he grunted, "Nish-ish-shin," and curled up to sleep.

As Antoine and I sat by the fire while the Indian snored I told him about the oak tree and the squirrel

which I had seen in the morning; seeing that I might not have thought of it again but for the fact that the tree was so scarred, as by some large animal climbing it.

"Ba Gar," said he, "ole pard, I'll tole you what. Shake! You done foun' a bee tree an' we'll gat da honey. Whoop! I'll tole you we'll got no bear meat no mo' w'en da las' one he all heat up an' da deer he all in da yard an' poor, I'll tole you da honey he come in good an' I'll cut da bee tree w'en da day come. You do good t'ing w'en you go down da riv'. Shake!"

I was curious to know why Ah-se-bun was the only Indian who visited us except the party which once came with him, and why he seemed to be wandering up and down, and never carried a gun. Antoine told me that there was an encampment of Indians about 150 miles north on the Flambeau River, a branch of the Chippewa; another some sixty miles due east on the Wisconsin River, and a third one thirty miles southeast on the same stream. Our friend was a sort of messenger between the three camps, and our cabin was a convenient point for him to stop, eat and rest. As Antoine put it, our guest did not carry a rifle because he always started with some "grub," but would prefer to go hungry for a few days, if necessary, to carrying a rifle and such game as he might kill. Then it was all plain. Ah-se-bun could go hungry for two or three days, eat enough to last a week and go on, and he was too lazy to hunt and carry his gun and game. Afterward I learned that he was not peculiar in all this, but that they were the common traits of his race. As near as I can make out from the map of Wisconsin in a school atlas of to-day we were on the fork of the Bad Ax River in what is now Vernon county, and just north of Readstown; but there was no town, village or settlement on the river that we saw or heard of when we went up it in 1855. At any rate, we were near the main forks of the river and our cabin was between the streams.

Our Christmas festival was ended. The morrow would bring the regular routine work, only varied by the conditions of weather.

"We ring the bells and we raise the strain,
We hang up garlands ev'rywhere
And bid the tapers twinkle fair,
And feast and frolic—and then we go
Back to the same old lives again."

It was a happy Christmas because all our simple wants were filled. We were warm and well fed; every wish had been gratified as far as we had wishes, for we could say with Biron, in "Love's Labour's Lost:"

"At Christmas I no more desire a rose
Than wish a snow in May's new-fangled shows."

And so with minds at peace and bodies prepared for rest we stepped over the sleeping Indian by the fire and crawled into our own blankets, and if there were any visions they were of the loved ones at home.

In the morning Antoine used a file on his axe while I prepared the breakfast, and then Ah-se-bun went down the stream with us as far as the bee tree, and continued his journey without even a good-by grunt or the slightest expression of interest in our work. This sort of thing had ceased to exasperate me, and I was getting used to what Antoine termed "Injun unpoliteness," for said he: "Dem Injun he t'ink it smart to be unpolite, but he lak you an' he doan lak you, an' he doan tole you how much. Hit make no dif'. Ole Ah-se-bun he say, 'Kego-e-kay nish-ish-shin,' an' he mean you good man."*

"That may be all right, Antoine, but when the hungry cuss comes into camp he is polite and gives us the *bon jour*, which he learned from your people; but when he's got his belly full he goes off and never gives us a grunt—which is the salutation of his people. It may be all right, but I don't like it. Your people and mine give as warm a shake at parting as they do at meeting, and when we have been entertained we say 'good-by' if no more."

"W'en you know Injun better you fine heem hout more, an' you doan mind. You know w'at make da scratch all-a bark f'um da bee tree an' roun' da hole? I'll tole you. He's a bear, an' he'll clam hup for getta da hun' an' fine da hole too small. Da bee he on'y come las' year, 'cause da bark on'y scratch hoff dis a-wint'."

Antoine cut down the big oak without help. I was fully as strong as he was, but when it came to handling an axe my wild blows counted but little, while not one of his was wasted. I could strike once in a place, but Antoine's stump was a level one; and the tree, if straight, would be weakened to the proper point on the side he wished it to fall before the other side was touched. An expert axeman is a mechanic in a broad sense. I never was an expert with the axe like Gladstone, Len Jewell, Antoine and other great men.

The great oak fell, and limbs which kept the trunk from the ground were cut, and then the question was: Is the store of honey above or below the small hole, which was not large enough to admit a man's hand? A careful examination of the hole showed that a dead limb had left a place which woodpeckers had followed into the heart of the tree, and the rains and the frosts had helped them to enlarge their excavations in the decayed heart, but the yearly growth of sap-wood had kept the outer hole small. The bees had so closed the hole with wax that the rain was shed outwardly, and when we cut off a section 2ft. above and a like distance below the hole, and split it, we found a store of honey that made us cut poles in order to carry it home in a roll of bark. It not only helped us out through the season of scant game, but we took some honey home to Potosi. What's that? You want to know what became of the poor bees which had laid up this store to keep them through the winter? In the name of man, what do you think? They simply died from cold and hunger; what's that to us? You fellows who think that because a bee had laid up a store for the winter by hard work he is entitled to use it to preserve his life make me tired. What is the suffering or death of any animal to man, if he wants the product of its labor to tickle his palate, or its fur to supply the demands of fashion? What is the suffering of his fellow man to him if he fills his coffers? Yet this spirit of selfishness exists throughout all nature; the fox eats the rabbit, but there are men who have sacrificed self for principle, a motive beyond anything that is possible for one of the "lower animals" to do, and after all there are men who are really honest as the world goes who will rob a hard-working bee of the fruits of its summer labor and leave it to perish in the winter.

A month later there was a thaw and I got caught in it. The thongs in the snowshoes softened and stretched, and in places where the shade of hills or trees preserved the temperature the snow packed and froze on the thongs until it was severe work to lift a foot. Frequent recourse to the stream removed the snow, but it was only a temporary relief, and progress was slow and painful. The crust had softened, and without snowshoes a man would sink down at least 20in., which was knee-deep for me, and in snow packed by laying all winter this made travel impossible without snowshoes, while with them a thaw like this clogged them so that they were of little use. It was evident that I must make a camp for the night before the regular camping place could be reached, and before nightfall I had a shelter constructed against a huge log by means of poles and brush, and a bed of balsam boughs kept my blankets from the snow. I was out three nights on this trip, and was lame and sore on reaching the cabin. The stream was so high and rapid that it would have involved some extra miles of travel to find a crossing place if Antoine had not felled a great oak across the swollen brook at the point where he knew I would reach it.

Antoine had a severe toothache. It had troubled him a little for some weeks, but now it was raging. Tobacco had no effect upon it, and he suffered in silence except when an extra twinge forced a *sacre* or a big D from him. He ate little, but sat by the fire and thought. Pipe after pipe was filled and emptied, and still he thought. My sore muscles kept me still until it was about time to turn in, and as I moved Antoine looked up and said: "I'll tole you. You gat pull dis toot'. I'll can't stan' heem no mo', you mus' pull-a heem. W'at you say, hey? I'll t'ink I'll wait till you come back, but he hurt lak da dev'."

Here was a strange job indeed. In the course of my short experience I could remember going down the Greenbush bank to Dr. Getty and seeing him wrap a handkerchief around what he called a "turnkey," and then I nearly fainted when he told me to open my mouth while he applied that villainous thing, which was like a "cant hook" which lumbermen use to roll logs, or like a stump puller, and twisted a molar out of my jaw by turning such a handle as a corkscrew has. Later, Dr. Frisbee had used the more modern forceps on one of my incisors, and these recollections were vivid, as they called up the sensation of nerves pulled until they snapped like a harp string. I ran these things over rapidly and said:

"Antoine, I hav'n't got a tool to pull a tooth with and wouldn't know how to pull it if I had. I've seen the loose teeth of children pulled with a thread, but that tooth of yours is solid in your jaw. I can't do it, no use of talking about it."

"I'll gat da t'ing all plan," said he, "I'll tole you. 'Fore you come I'll run up all da lead in bullet for you' big gun an' mine. Dan we gat no use for da mole. You'll tak da mole an' pull da toot', hey?"

"Antoine, I can't pull that tooth with a bullet mould, it isn't the right shape, and it won't hold. I'll only torture you and you'd better wait until we get back to civilization. The tooth may be better in a few days. Try and bear it, we'll be home in a few weeks, and then if it troubles you there will be a chance to have it pulled by some dentist; I can't do it, and that is all there is about it."

"Now look-a here. See how I'll fix da mole for pull-a toot'." And he showed me how he had ruined a good bullet mould to make a poor pair of forceps. He had taken one of the files which we brought to sharpen our axes and had filed off the outsides of the mould into the cavity until the thing resembled a blacksmith's pincers. Then he had roughened the tips to make a grip for them, and had actually hollowed the edges to fit his tooth. I looked the thing over with conflicting emotions. Here was an instrument of torture which in expert hands might relieve suffering, but in mine seemed sure to increase it. One thing was certain, Antoine was in earnest; he was desperate; no suicide was ever more so. He watched my face and after a while said: "W'at you say, hey?"

"I say that I want to help you out of your agony, but I don't believe I can do it."

"You 'fraid you hurt me, hey?"

"Yes, Antoine, that's just it, I'm afraid I will hurt you and not do you any good."

"I'll tole you, he mak' no dif'. I'll gat all da hurt. W'at for you 'fraid? You no getta hurt; come on, I'll tak' da chance; you tole how you want me for set down so you pull da bes'."

Putting fresh logs on the fire and bringing in some brush to make a bright light, for the old man would not wait until morning, I looked at the offending tooth. For the benefit of my dentist friends who have given me the most exquisite form of torture applied to man in modern days, I will say that the offending tooth was a pre-molar on the right side of the lower jaw.*

Antoine laid himself on the floor and I sat with my back to the logs of the cabin. If they did not give way I was all right. I pulled him up to me, put a wooden plug between his molars to keep his mouth open, planted both feet on his shoulders, put the improvised forceps on the tooth and pulled. There was a howl as I pulled with arms and pushed with legs, but the "pullicans" slipped from my hands. They were all right as far as a grip on the tooth went, but they were not made for a strong pull on their handles.

Let us pass over, in a spirit of charity, any remarks that Antoine made. No doubt the recording angel blotted them from the book, as he did the one made by "my Uncle Toby," and I have no desire to go behind the record further than to say that Antoine really did say something when his tooth was started from its socket, but still throbbed with violence.

Antoine arose and looked at me, "more in sorrow than in anger," and I hastened to say: "The mould slipped in my hand, there is no grip on the handles, but if you can stand another go of this I will fix the thing so that the tooth or the bullet moulds will break or I will bring out the tooth or your jaw bone. What you say, hey?"

Antoine merely nodded assent and I put the handles of the bullet mould in the fire and then turned them outward so that they could not slip through my hands. Something must come now if Antoine had not had enough. I was not sure that I could have stood another such a trial if our positions had been reversed, but it is easy to stand it when the other fellow does the suffering. When the handles were cool and all was ready I looked at Antoine, who had resumed his seat by the fire with his jaw in his hand. He arose and said:

"W'en you ready I'll come one odder tam. Mebbe you'll t'ink da ole Frenchman got no game an' he no stan' da gaff.* Come on, I'll be all a-ready." And he lay on the floor in the proper place. His nerve gave me confidence and again I put the plug in his mouth, braced my back against the logs and my moccasins on his shoulders. Carefully pushing the "pullicans" down as far as I could get them, I gripped the handles, straightened my legs and with a snap the tooth came out and my head made a tunk on the log behind that seemed hard enough to have left a dent in either head or log. Antoine jumped up and yelled with joy, He took the tooth and threw it in the fire, saying a verse in his French patois which I did not understand, and after a comforting pipe we went to bed.

Spring came. The melting snows filled the streams. The drumming call of the woodpeckers on a dead tree sounded frequently and the thunder of the cock partridge or ruffed grouse was frequent. Ducks flew up and down the stream and the snow in places was not a foot deep. Antoine said: "I'll tole you. W'en you go on you' line it's las' time to-morrer, an' you bring in all-a steel trap an' let down all-a dead-fall. Da fur he get loose an' begin for to shed an' it's no use to stay here longer w'en you no get da prime skin. We go home. I t'ink; yes?"

I ran my line for the last time and came in and packed up for the home trip. Our packs were arranged and were not as heavy as on the up trip. The provisions were about gone and the furs were dry and light, so we only had to make two trips instead of four from our cabin to the boat.

Our provisions and cooking utensils with one rifle were taken on the first trip and the furs on the second. The otter skins had been stretched on long "shakes" split by Antoine's axe; the other skins, except those of the two wolverines, the deer and bear skins, were "cased" and had been stretched on forked twigs, and therefore the flat hides made a large, broad pack, which was more difficult to get through the forest than the more valuable furs which were cased. Just here it has occurred to me that there are technical terms used in the above that a small boy in the back seats might not understand, and for his benefit I will say that a "flat hide" is one that is split on the belly as a butcher skins an animal. Fine furs are "cased," *i. e.*, only cut on the hinder edge of the hind-legs and the skin drawn off over the head, leaving it like a mitten without a thumb and wrong side out, that is, with the fur inside.

There was a feeling of regret at leaving the cabin, even though it was for home. It had been a home to us, and Antoine fastened up the door, saying: "S'pose we'll come nex' wint'. Who knows? W'en we come we gotta da good ole shanty. Come on." And we turned our backs to our winter home. We stopped a day at the boat to soak it up and swell the seams, and stowed our furs and provisions under the two tarpaulins and cast loose. The Bad Ax was swollen and the current was swift. There was no expenditure of muscle in rowing, but there was an anxiety lest pole or paddle should fail and wreck us on a bend or a riffle. Some of the latter, which we had to make a portage around in the fall, we could shoot now, with more or less risk. When we reached the Wisconsin River we camped and felt that all danger was over. It was plain sailing after this. We killed five mallards with our rifles, and that gave us plenty of fresh duck, and we caught a large pike by trolling a minnow. Next day we merely guided our boat down the river and into the Mississippi, and after one more night out the Father of Waters brought us to Dubuque, some eighteen miles below Potosi, where Antoine had a bachelor's cabin and I had dearer ties.

When we tied up at the wharf at Dubuque and went ashore we met Frank Neaville and learned that all our loved ones were well. Frank went home that night and carried the news of our arrival. There were several fur buyers about Dubuque and they came to see us. I was for selling to the first one, but Antoine would not have it. The buyers came down and handled our furs and bid on them, and finally they were sold for cash one morning. There was a steamer to go up in the afternoon which would run up the Grant River to Potosi. I would go on that, but Antoine had struck some Canuck friends and had got drunk, and I did not want to leave him with the chance of his being robbed by those thieves which then infested the river towns and I went in search of him. I got him on board the boat with one of his friends and gave the steward a good tip to entertain them, and before Antoine knew where he was he found himself ashore at La Fayette, the landing for Potosi, with the major portion of his winter's earnings in his pocket.

Once during the next summer Antoine came to me and made me a proposition to go down in Louisiana and trap next winter. He said that fur was plenty there and in the spring we would take our skins to St. Paul and sell them to some green fur buyers who would think they were Northern furs. I did not do it, but will tell you where I went the next winter later on.

My good friend Hon. J. W. Seaton, of Potosi, Wis., whom I knew in the days of which I am writing, sends me this note in response to a question: "I can give you but little information about Antoine Gardapee, the French trapper you went North with the winter you write about. I remember you both very well and the fact of your going up on the Bad Ax the year before Tom Davies, and you went with the surveying party when Henry Neaville froze his feet, but I can't recall what became of Gardapee further than this: He ran a private ferry on the Mississippi River from Cassville, Wis., to the mouth of Turkey River, Ia., some years after you left Potosi. The generation in which he lived has passed away—the trapper, hunter and Indian have gone to the happy hunting grounds and have left scarce a trace behind them; their names, places, kindred and friends are alike forgotten, and the pall of oblivion hangs over their resting places.'

There seems to be nothing to be added to the very good obituary note of Judge Seaton.

FRED MATHER.

* Kego-e-kay means "the man who fishes," Kego being the Ojibwa word for fish, and nish-ish-shin is simply a long word meaning good. In the foregoing sketch it may be remembered that I had been named Kego-e-kay by a party which had found me fishing.

* I hereby serve notice on Dr. Nash, who has tortured me in his chair, that if I write up our fishing trip to Blooming Grove Park he need expect no more mercy than I have got from him. Even "the worm will turn," and when I write up that bass fishing on Lake Laura it will be my time to get square and pay up old grudges. I merely quote: "Don't squirm, it ain't a-going to hurt." All things come to him who waits.

* The expression "stand the gaff" was a relic of Antoine's cock-fighting days in Canada, and when he wished to imply that a man had no grit he would say, "He no stan' da gaff."

ANGLING NOTES.

The Father of Fishculture.

STEPHEN LUDWIG JACOBI was born April 28, 1709, upon his ancestral estate of Hohenhausen, in the duchy of Lippe, Province Varenholz, northwestern Germany.

When Jacobi was a youth of seventeen he conceived the idea of artificially fertilizing the eggs of fish for the purpose of restocking lakes and streams, and began a series of painstaking experiments. In 1741 he succeeded in hatching trout artificially, although the discovery was not made public until 1763, but he is known to this day as the father of artificial fish propagation, as Dr. Garlick is known as the "Father of Fishculture in America."

On July 4, 1896, the anniversary of American Independence (as I learn from the London *Fishing Gazette*), a monument was erected to the memory of Jacobi at Hohenhausen by the representatives of the German fisheries' associations. The *Gazette* reproduces a photograph of the memorial and says: "The stone, or rather the huge heap of rough boulders, stands on the site of Jacobi's hatchery, the spot where this modest country gentleman carried out his experiments 150 years ago, on the banks of the Kolle, the beautiful little stream where nature taught him his first lessons in trout breeding, and where, after years of observation and careful scientific labors, he succeeded in raising artificially both trout and salmon very much in the same way as nowadays in England and the States.

"The monument was unveiled in the presence of the Prince Regent of Lippe and his consort princess Victoria, a granddaughter of Queen Victoria, who throughout has shown the greatest interest in the researches which culminated in the idea of raising a monumeut to Jacobi on the very site of his labors, and vindicating for him the right of being called the originator of trout breeding, as now understood the world over. * * * The notes published by Jacobi in 1765 show him to have been an extremely accurate observer of nature, and of *Salmonidæ* in particular. His instructions as to spawning, hatching and rearing fish might be followed even to-day with advantage.

"The hatching box used by him was very much what American fishculturists use nowadays, and would form a very excellent redd for incubating and hatching trout or salmon ova. At the unveiling of the monument one of these boxes, which has more than a historical interest, was shown. The box is 12ft. long, 18in. wide and 6in. deep, with movable lids and a grating at top and bottom to exclude enemies and protect the young fish. The eggs were hatched on a gravelly bed, and the fish partly planted as fry, partly transplanted to small ponds and planted as yearlings.

"The old nursery ponds used by Jacobi can still be traced, but do not exist any longer as ponds, having been made into water meadows; but not very far from the site of the hatchery at Steinbergen, near the hunting seat of the Prince of Bückeburg, some beautiful trout ponds, engineered by Jacobi, are still working, and supply an annual stock of yearlings for adjoining streams."

The picture of the memorial shows a pile of boulders six courses high rising from the bank of the stream, surmounted by an upright flat-faced stone, bearing an inscription; while on the front of the pile is a tablet, evidently the coat of arms of the man for whom the memorial is erected. A half score of great wreaths, ribbon-tied, are spread on the ground before the monument.

A few years ago, in preparing a Lyceum paper upon the "Progress of Fishculture," I had occasion to look up what was known of Jacobi as a fishculturist (securing material aid from my friend, the late Prof. G. Brown Goode), and when I had completed my search I could not understand how it was possible to question the fact that Jacobi was the first to hatch trout artificially. His discovery was announced in a Hanoverian magazine in 1763; was indorsed by German naturalists in 1764; his memoir was published in Paris in 1770; his discovery was recognized by George III. in 1771, who granted him a life pension; the first public demonstration of the principles of fishculture was in Paris in 1772; the translation of his memoir into English was done in London in 1788; the beginning of fishculture in Italy dates from 1800; in Bohemia from 1824; in Great Britain from 1837, when John Shaw hatched and reared salmon to two years of age; and yet Gehin and Remy are correctly credited with being the fathers of fishculture in France between 1842–44.

French authorities say that Joseph Remy was an illiterate fisherman, but he made known his alleged discovery of artificial fish propagation in a formal letter to the Prefect of the Province in which he lived, and the next year he was a candidate for an award from a scientific society, and he and his colleague, Gehin, received a premium from a provincial society of emulation. If Remy could write in French he must have been able to read in French, and at the time he claimed to have made his discovery Jacobi's experiments had been published more than seventy years in the French language in various popular treatises on fish and fishculture.

Furthermore, it is of record that twenty years before Remy local experimenters in his own district had succeeded in hatching trout eggs. It has seemed to me that Remy simply borrowed Jacobi's ideas, and after all in this country the first experiments in fishculture are traceable to the influence of Remy, the imitator, rather than to Jacobi, the originator; for Dr. Garlick got his idea of hatching trout from the publication of Remy's experiments in Paris in 1850. Perhaps 150 years hence the people of this country will erect a monument to Dr. Garlick for inaugurating artificial fishculture in America.

It will be noticed that the *Gazette* says of Jacobi's early operations: "The eggs were hatched on a gravelly bed, and the fish partly planted as fry, partly transplanted to small ponds and planted as yearlings." This is entirely new to me, as it is the first mention of the fact, so far as I have been able to discover, that the father of fishculture was also the first to realize the importance of rearing trout to yearlings before planting them in wild waters, and for this alone he should have an additional wreath on his memorial.

Black Bass Length Limit.

It is reasonable to suppose that the framers of Article XV. of the game law of New York, which makes special provisions as to the waters of the Thousand Islands in the St. Lawrence River, when they wrote section 325 of the law, had good reasons for so doing, and the Legislature must have believed that the reasons were good or it would not have made that section a law of the State.

The section reads: "No black bass less than 10in. in length shall be intentionally taken alive from the waters of the Thousand Islands, nor shall the same be killed or possessed, and in case any such fish is caught or taken the person taking it shall immediately place such fish back in the waters from which it was taken without unnecessary injury." Then follows a penalty of $25 for violating this law.

Section 111 is similar in all respects to section 325, except that the limit of length of black bass is 8in., that the provisions apply to all the waters of the State (excepting the Thousand Islands) and the penalty is $10 instead of $25.

Why should the black bass in the St. Lawrence River have better protection than the black bass in other State waters? There is no reason why they should, but the people of the St. Lawrence River region are more alive to the necessity of something like adequate protection for these fish than the people of other parts of the State, and have procured a law limiting the catch of bass in a day to twelve fish, and increasing the limit of length from 8 to 10in. This will do a little something toward preserving a fish that is not protected by law during its breeding and brooding season.

Last winter a bill was passed providing for a fishway in Rock Bottom Dam in the Susquehanna River at Binghamton.

Last month I went there with the Division Engineer of the State and Mr. W. H. Rogers, the builder of the Rogers Fishway, to locate the fishway in the dam. The water was low and clear, and as we stood on the dam we could see schools of little black bass in the water below it. There were eleven men and boys on the dam fishing for these little bass. Some one in the interest of fish preservation had placed a large sign on an old mill at one end of the dam calling attention to the law which forbids the killing of black bass under 8in. in length. From one end of the dam to the other I did not see a bass in the water that would weigh ½lb., but the boys and the men were catching fish all the time. I examined the strings of fish that they had and they consisted of small bass just 8in. long and a little more, and of sunfish. I saw one fisherman land a small bass which looked to be under 8in., and as he was about to string the fish I went to him with the tape line with which I was measuring the dam, but he anticipated me by pulling from his pocket a piece of a foot rule as he said, "I measured this fish and it is just 8in. long." It was just 8in. long, and when it was dressed for cooking it would not make a decent mouthful. There were a number of small bass dead in the water, and I discovered that their death came about through the measuring process; for each fisherman, man and boy, had either a foot rule or 8in. marked on his fishing rod. When in doubt the bass was held down by the fisherman's foot against the apron of the dam and the infant bass was measured. If it could not be squeezed to measure 8in. it it was put back, generally, I fear, to die. I was informed that 500 to 600 bass a day were caught from the dam, all little things 8 or 9in. long, and I did not see a single bass on any of the strings that would measure 10in. in length. If the fishway when it is completed serves no other purpose than to stop the slaughter of baby bass from the dam it will be worth all that it will cost, for all fishing is prohibited within fifty rods above and below a fishway.

Shad and Sawdust.

While we were at Binghamton, Mr. Rogers told me that on one occasion the shad netters in the Bay of Fundy complained that the sawdust was working injury to the shad fishing. Mr. Rogers was sent there by his father, who was Inspector of Fisheries of Nova Scotia, to examine into the matter and report.

In Cumberland Basin, at the head of the bay, shad poles are set while the extremely high tide is out, and after a flood tide wagons are driven down to the nets and the shad removed. Mr. Rogers says it is a curious sight to see the shad hanging in the gill nets, their silvery scales shining in the sun, with no water beneath them, as the fishermen gather the fish into wagons. He examined the contents of the stomachs of many shad and in some he found what under a microscope proved to be small particles of wood, but that this was not the cause of the shad being driven away was proven the very next year, when they returned as plentiful as ever.

Scratching a Salmon's Back.

At one of the retaining ponds in Canada, where salmon are confined and held until their eggs are ripe to be hatched artificially, Mr. Rogers one day put his hand and arm down between the grating into the water to see what the salmon would do. At first they swam as far away from his hand as the limits of the pen would permit, and then curiosity seemed to be aroused and one big salmon swam up to his hand and touched it with his side. At the least motion of the hand or fingers the fish would dart away only to return. Little by little the fish gained courage and permitted the hand to rub his sides and back, and finally Mr. Rogers scratched his back as he would scratch the back of a pet dog, and the salmon seemed to like it, for it did not move away unless some unusual motion was made by another part of the man's body, and if the fish did move away it returned very quickly to have its back scratched again.

Transporting Crayfish.

A correspondent writes: "Will you describe in FOREST AND STREAM the best method of shipping crayfish long distances and have them arrive alive and in good condition."

Crayfish may be shipped in any vessel that will hold water, from a bait bucket to a fish can. In the bottom of the can or bucket place a quantity of sand, gravel and a few stones as large as a hen's egg. The crayfish will burrow in the sand and gravel under the stones, but unless they are furnished with material to construct a hiding place they will destroy or maim one another. The cans should not be overcrowded with the crayfish to insure perfect success in transportation. Over the sand and stones pour water until it is 6 or 8in. deep in the can. On a long journey in warm weather the water will need to be changed by drawing it off with a siphon and adding fresh water. Crayfish do not require water as cool as young trout, nor does it require to be as frequently changed; but they will not live in warm, foul water. They cannot be moved with safety when they are shedding, for their shell is then very soft; but when the shell is hard they can be moved if the water is reasonably fresh and cool, and they are not crowded to the point where they will injure one another.

"Getting Even."

It is not unusual for violators of the game and fish laws, when caught and fined, to desire to get even with somebody for having brought them to justice. It is this very state of things which often deters a man from making a complaint against a neighbor who has violated the law. I have found this to be so over and over again. A man knows that some one has violated a game law and he wishes to have him punished, but he will not appear as complainant for fear the guilty one will "get even" with him in some way. An amusing case of this sort recently occurred in New Hampshire, and a friend has written me about it.

At Sunapee Lake there are two brooks flowing into the lake called the Pike brooks, because they flow through land once owned by a man of the name of Pike. A State hatchery is situated on one of the brooks, and both are used by the State as nursery streams for young trout and salmon, and as such are closed to all fishing; and Col. Nathaniel Wentworth, when he puts up a sign to protect his baby trout and salmon, means that the warning shall be obeyed, for he is fond of his fish, and desires that they shall have a fair start before they are caught. Well, somebody had been fishing one of the Pike brooks contrary to law, and Col. Wentworth had no other business to attend to until he had found out with reasonable certainty who that somebody was. Evidence was secured that led to the arrest of one Frank Kemp, and he was fined; but while Commissioners Wentworth and Hughes were hunting Kemp down they found evidence implicating Charles Barron, who was brought before Judge Shurtleff. Barron was not quite sure that he could be proven guilty, but as it began to look as though he were to be "put away" for a season, he told Judge Shurtleff that he would plead guilty and pay his fine if the name of the complainant in his case was disclosed to him. He did not say how he intended to get even with the complainant, whether by burning his barn or maiming his stock, but he just wanted to know who the man was. Judge Shurtleff agreed to the proposition, and Barron counted out $25 into Commissioner Wentworth's hands, who put it into his pocket. Barron then wished to know who the man was that had caused him to give up his money, and Judge Shurtleff put the complaint before him and he read: "Nathaniel Wentworth, of Hudson Center, Fish Commissioner of New Hampshire."

A. N. CHENEY.

An Arkansas Bass and Game Point.

I HAVE had some fine fishing this summer. I had to hold court as special chancellor in Chicot county for ten days. Lake Village, the county seat, is situated on Lake Chicot, which is twenty-five miles long, a mile wide and of unknown depth. The water is as clear as the sky, and the fishing is fine. One morning Mr. Garland Streett and I caught forty-seven striped bass, black bass and white perch before court time, and on another I caught forty-five by myself. Shooting is said to be fine in the winter and fall, but I have never tried it. The easiest way to get there is to go to Greenville, Miss., and then take a boat either to Luna Landing or Vaucluse, from which places transportation can be procured to Lake Village.

Quail shooting is good this fall. The season has been horribly dry and no birds got drowned. For that reason duck shooting may be correspondingly poor, as water is scarce, and lakes and streams are dry that were considered perpetual. They have not come in much yet, so I cannot say as to them.

J. M. ROSE.

Striped Bass in New York Bay.

ON Friday, fishing at night at Liberty Island, Charles S. Derby, of Rod and Gun department New York *Press;* James Reithel and Dan McCarthy, caught ten striped bass. The largest weighed 10lbs. They hooked two larger fish, but did not land them.

It was a disagreeable, stormy night, which probably accounts for the unusual catch for that vicinity, as the water along shore was stirred up, and the bass came in there to look for feed.

The Kennel.

UNION FIELD TRIAL CLUB'S TRIALS.

THE first annual field trials of the Union Field Trial Club were held at Carlisle, Ind., commencing Monday, Oct. 26. The weather was a little warm and the ground dry, but taken all in all the event was quite a success, and the club feels very much encouraged. At the annual club meeting Tuesday evening the same officers were re-elected for the coming year, and the second Monday in November, 1897, was the date claimed for the next trials, and Carlisle the place for holding them.

Now, without any exaggeration, your reporter is going to make the assertion, based on his own experience and from what he has heard others remark: The grounds on which was run the All-Age Stake are the finest in the United States for holding field trials. Spectators can sit in a buggy on the public highway and witness considerable of the competition. The farms are in large tracts, houses few and far between. In fact, the grounds could not be made to order to suit the purpose any better. Birds were found sufficiently numerous.

The judges were Royal Robinson and S. H. Socwell. Among well-known sportsmen present I noticed Norvin T. Harris, J. L. Adams, Mr. Churchill, of Louisville, Ky.; Edward A. Burdette, Chicago; C. P. Mingst and C. F. Hartwitz, Evansville, Ind.; Richard Merrill, Milwaukee, Wis.; P. T. Madison, J. T. Kerr, Joseph Becker, Indianapolis; Charles Fox, Bicknell, Ind.; and several others, whose names I did not learn. The winners in the Derby were a good lot of dogs.

Winner of first, Josie Freeman, is by Antonio out of Nellie Hope, and is owned by John Gude, Bruceville, Ind. She is a medium-sized black, white and tan bitch, is put up on the lines of a goer, is easily handled, goes at a good pace, has good range and stays out at her work.

The winner of second, Ripple, is a very handsome liver and white pointer bitch by Rip Rap out of Pearl's Dot, and is owned by Hampton S. Smith, and handled by J. H.

Johnson. She is a nice-going dog, and well deserved the honors conferred upon her.

Rod Gladstone, by Rodfield out of Sue Gladstone, owned by Mr. Pollard and handled by Geo. McLin, captured third money. This dog was only four weeks in the hands of his trainer, or the writer predicts he would have hustled his more fortunate competitors. Rod has a happy way of going as though his life depended on his getting that covey point first. This pup is the first of Rodfield's get to start in field trials, and the writer prophesies a great future for the sire if this puppy is a fair sample.

Fourth prize went to Dave Earl, a black, white and tan English setter dog, by Count Gladstone IV. out of Don's Lady.. He is owned by Theo. Goodman and was handled by John Johnson. Dave is an excellent worker in every respect, but seemed to be off on nose and hard-headed.

The Derby.

After the drawing Monday a start was made two miles from town. Unfortunately the ground selected was not adapted for field trials.

The first brace, Albert Lieber's black and white dog Spot, handled by Harvey, and Charles Fox's black, white and tan bitch Easter Lily, handled by Geo. McLin, were cast off in a woods pasture. After running perhaps thirty minutes and not finding birds, the dogs were ordered up and a move made to a more favorable place.

Keno N., a black, white and tan dog, handled by Mayfield, and the black, white and tan bitch Rudge Gladstone, owned by Richard Merrill and handled by Tom Richards, were next. After drawing a field of heavy corn blank, the dogs were worked through standing corn with the same result. Returning to road, a bevy was flushed by spectators and settled in ragweeds. Neither dog showed much merit, and after flushing three or four birds were ordered up. Down 43 minutes.

The next brace, Josie Freeman and Ripple, cut out their work in a pleasing way, both getting away at a clipping gait—range and pace a little in favor of Josie. Birds were found in very unfavorable places to do good work, heavy undergrowth and briers making it impossible for dogs to show to the best advantage. The pointer was game and faced the needles on bushes as well as any setter could do. After a long run in the hot noonday sun they were ordered up and a move made to refresh the inner man.

After lunch Rod Gladstone and Dave Earl were cut loose in a big ragweed field. Pace and range were equal to the best. Dave Earl did not distinguish himself on point work, and at one time got beyond the control of his handler and made a flock of turkeys take to the trees. In the meantime, with Johnson yelling, whistling and saying pretty things to Dave, Rod Gladstone made a long cast in a hill and made a beautiful point in rather a bare place. McLin flushed; Rod was steady to wing and shot. Sent on, he directly drew on an outlying bird, and to flush conducted himself in a becoming manner. Dave now being ready to attend to business, the dogs were sent away. The sun shone hot, and the dry ground made it anything but favorable to find birds. However, the dogs proved their staying qualities and hunted as industriously and with as much earnestness as though the weather was just right. Down 40 minutes.

Men, horses and dogs were hot and tired, and a break was made for a cool, shady place. After a rest Mr. Johnson consented to run Dave Earl again and he was sent away with Josie Freeman. Dave kept up his slashing way of going until he was ordered up, which speaks well for his courage and endurance. It took 55 minutes to satisfy the judges as to the relative qualities of this brace. Josie acquitted herself favorably, as she had done in her previous heat. Dave minded somewhat better, but seems to be off on nose.

Ripple and Rod Gladstone in a big field with cover just right cut out a pace and range that was delightful to see. After drawing ten fields blank Ripple whirled on a point in a gully. Rod, going at a race-horse gait down the bank, could not stop in time to back, but almost fell on the birds. At flush of birds both dogs were steady under very trying circumstances. The dogs were then worked around to covey marked in heavy cover. The birds rose wild and neither dog got a point.

The judges now held a consultation and decided to allow Keno N. and Easter Lily another trial. Suffice to say they were ordered up after awhile, as neither had shown himself worthy of a place.

In the evening the awards were pasted on blackboard at hotel: First, Josie Freeman (setter); second, Ripple (pointer); third, Rod Gladstone (setter); fourth, Dave Earl (setter).

Grand Rapids Show.

THE Butterfly Bench Show Association, Sec'y Grace H. Griswold, 184 N. Lafayette street, Grand Rapids, Mich., will hold a show under A. K. C. rules Dec. 8, 9, 10, 11.

MONONGAHELA VALLEY GAME AND FISH PROTECTIVE ASSOCIATION'S TRIALS.

THE second annual trials of the M. V. G. and F. Association began Oct. 28. There was a good attendance of sportsmen, who displayed an enthusiasm to a degree seldom seen at the more pretentious trials. The following list of names includes most of those who were present: G. O. Smith, Wheeling, W. Va.; Mr. Boyd, Indianapolis; Dr. Ross Foster, Crafton, Pa.; A. C. Peterson, R. C. Stenger, Dr. Geo. Gladden (president of the Association), W. H. Beazell, Homestead, Pa.; C. E. Shirley, G. W. Lang, R. S. D. Hartrick, S. B. Cummings (secretary), T. H. Havocotte, L. O. Seidle, T. B. Hutchison, Geo. Mesta, W. B. Brush, Wilmerding; Frank Kreuse, Joe Kelley, Pittsburg; Hervey Christ, Belmont, O.; K. P. Beattie, East Liverpool, O.; Geo. Battison, Youngstown, O.; R. V. Fox, Harrisburg, Pa.; Dr. S. W. Hartt, J. Schaumm, McKeesport, Pa.; J. Gladden, Charleroi, Pa.; F. D. West, Brownsville; J. F. Bell, Carmichaels, Pa.; Maj. J. M. Taylor, New York; and there were a number of others—resident sportsmen—who were in daily attendance, so that the numbers all told made quite a following each day.

Messrs. W. S. Bell, of Pittsburg, and S. C. Bradley, of Greenfield Hill, Conn., judged both stakes, and it is hardly necessary to add that their part was done skillfully, industriously and satisfactorily. Mr. Cummings, the secretary, was untiringly energetic in his attention to all details of the trials.

The conditions were unfavorable from several causes, chief of which are that the trials are held too early, so early that it is impossible to give the dogs the needed training and conditioning; the vegetation is rank and green, the frosts and storms having had but little effect on the shorter cover. Many of the birds were but half grown or less and made but little effort to escape from the dogs. The weather was too warm, being more like that of the summer than of the fall. If the Association could so fix its dates as to run its trials at a later period, when the frosts have killed the vegetation, but still at a time before the freezing weather of winter sets in, such would be a gain to the competition in every respect. The birds would be stronger and wilder, the scent and the conditions for scenting would be better, the dogs could run without any of the distress which comes from overheating; in short, as every important factor would then be more in season, all of the competition would be of a higher order. No handler can make satisfactory progress in warm weather on half-grown birds so far as it refers to competition. The dogs have but a lukewarm interest in the work at such times, and it is not to be expected that they will make a better showing in the competition than they will out of it.

The trials were run on the Association's preserve of 7,500 acres in Greene county, six miles from Waynesburg, reached by a winding narrow-gauge road, as crooked a twenty-eight miles of road through the hill country as could well be imagined by a normal brain, and Washington in turn is about thirty miles from Pittsburg, on a branch of the Pennsylvania R. R. The entire party was cared for by the farmers whose homes were conveniently near by the grounds.

The preserve is very hilly, some of the hills being of majestic size. As the search for birds led the party from one hill top to another, picturesque scenes of valley and hill were unfolded to the view—long sweeps of deep valleys winding far away, with a few farmhouses nestling here and there on hillside and valley, made so small by distance that they seemed to be dwellings in miniature; oak woods in irregular patches gave a rich coloring to the great picture, besides filling the more useful office of sheltering the quail, and the coloring was variegated by the wheat, corn and weed fields, which were on hill and valley everywhere. In the distance a glimpse of the Blue Ridge Mountains standing far up against the sky in the horizon in deeper blue than the sky itself could at times be caught, and their height made the nearby hills dwindle into insignificance in comparison. Notwithstanding the hilly character of the country, the soil is very fertile, and there is consequently an abundance of food for the birds everywhere. Their greatest danger is from the severe winters. On the hillsides and valleys farms flourish, even on the sides of hills so precipitous that the manner of plowing them must remain a conjecture to those who have not seen it done, as it must likewise remain a mystery how the soil when wet defies the laws of gravity and does not slide down into the valleys, as one could imagine it could easily do.

And thus the walking was of the kind in which the walker either steps very high or down very low, as he may be going upward or downward. The judges and reporters rode on horseback, as did also some of the spectators, and the walking when so done vicariously was much easier, and the hills lost their formidable appearance. The birds were mostly young, in size from squeakers to half grown, the full-grown ones being the exception, but whatever their size they were lacking in gamy qualities, as is common of all birds too early in the season. They were tame and slow to take wing and unsuspicious of danger. The vegetation was rank and green. All the conditions were unfavorable for good handling of the dogs, yet it was done with much less trouble to the judges than is commonly the case at the larger trials. The handlers were much more obedient, and also there was much less noise in the handling than there is at the more professional events. It was all done with commendable quietness.

The utmost good-fellowship prevailed. All enjoyed themselves thoroughly. The Association's trials are good ones for any sportsman to attend, both for the direct enjoyment and the knowledge to be gained in respect to the manner of running a club so that it will be a pleasure to all concerned. It is worthy of note that a large number of the dogs were handled by their owners. On Friday night, the day of the close of the trials, the Association gave a banquet, at which the affable and popular president, Dr. Geo. Gladden, presided. Several speeches were made and warmly applauded; but the speech of the evening, made by Mr. S. C. Bradley on field trial matters and the business relations of owners and handlers, was the most instructive.

The trials thus ended as they began, in good-fellowship and kindly feeling among all. The representative of FOREST AND STREAM is indebted to the Association's officers and members for a generous welcome and a courtesy which never wearied, and to Mr. W. S. Bell in particular for hospitality extended. Mr. Bell made the visit very pleasant for the press, and it was as novel to them as it was gratifying to be treated at a field trial as worthy of some consideration, instead of as a matter of course or a necessary infliction.

The Derby and All-Age stakes were both sweepstakes, 10 per cent. retained for expenses (which was far from paying expenses) and the balance being divided into 50, 30 and 20 per cent., first, second and third respectively.

Wednesday.

The morning was warm, with an overcast sky, the signs portending rain. There was no breeze, and the far-away sounds were so distinct that they seemed near-by. But the stormy signs soon disappeared. The sun broke through the clouds, making an uncomfortable warmth and weather conditions unfavorable either for searching or pointing, and very trying to the dogs' endurance. The work throughout the day was full of errors, and what work was done lacked proper finish. Several of the dogs showed quality, but were palpably lacking in the discipline and experience necessary for skillful performance, as was to be expected so early in the season.

The forenoon was almost a blank so far as the finding of birds is concerned, and of those found in the afternoon a large part were only half grown, and some were but little larger than squeakers, and some were squeakers.

The start was a little late owing to the multitude of detail to be arranged, but once started the trials were soon going with the regularity of clockwork.

The Derby.

There were nine starters, run in the following order:

O. V. Porter's b. and w. tkd. pointer bitch Strictly Business (Kent's Priam—Belle Fauster), H. Christ, handler, with S. W. Hart's b., w. and t. English setter bitch Fannie Allen (Beaconsfield—Bessie), J. Schaumm, handler.

G. Battison's red Irish setter bitch Kildare Dot (Finglas—Ruby Glenmore II.), owner, handler, with K. P. Beattie's b., w. and t. setter bitch Loretta (Gladstone's Boy—Rill Ray), A. B. Ferguson, handler.

G. Wm. Lang's (agt.) Irish setter dog Lang (Finglas—Kildare Gladys), Geo. Battison, handler, with G. Mesta's b., w. and t. setter dog Don (Wordsley Ben—Amy Robsart), J. W. Phillips, handler.

S. B. Cummings's b., w. and t. setter dog Doctor C. (Galert C.—Nan C.), J. W. Phillips, handler, with W. H. Beazell's b., w. and t. setter bitch Allie B. (Whyte B.—Rosa Bevan), Jack F. Bell, handler.

G. Gladden's b. and w. setter dog Muck, J. Gladden, handler, a bye.

The winner of first, Loretta, made an inferior showing on birds so far as pointing and locating are concerned, though she showed quality which will improve with experience. With her, as with others, the judges could only make the best of the unfavorable circumstances of warm weather, young birds, and rank vegetation and short preparation.

The work of Allie B. was very ragged, and that of Strictly Business was both meager and ragged.

STRICTLY BUSINESS AND FANNIE ALLEN were cast off at 8:40 and ran till 9:53. No birds found. Both dogs kept diligently at work within a middling range, the pointer showing the most skill in searching, though unsuccessful. Fannie was ranging fairly well, but showed many puppyish ways. The temperature was uncomfortably warm and no dog could make a good showing under the circumstances.

KILDARE DOT AND LARETTO began at 9:57. Each had a narrow range, though at the start Dot was a bit the wider. At the finish both were working slow in narrow limits. Up at 10:51. The heat was a poor one aside from the absence of birds.

LANG AND DON ran forty-four minutes, ranging narrow without finding.

The running was discontinued while the party went to lunch.

DOC C. AND ALLIE B. started at 12:52 and were ordered up at 2:04. Both showed some puppy traits and their work was short of finish. No birds found.

MUCK, the bye dog, ran thirty-seven minutes, beginning at 2:10. The temperature was still warmer. He started slow, but coming on a bevy he roaded it to a flush and chased. Then he pointed on the scattered birds repeatedly, chasing each time he pointed, which was what put him out of the stake. Sent on, he ranged out well. He showed a keen interest in birds, but was lacking in experience and discipline. However, his owner ran him in place of a dog he originally intended to run, and as Muck is a puppy with a limited experience his showing was commendably good. He did more point work than any other dog in the stake, though it may be added that he had better opportunities. Had he been steady to wing he undoubtedly would have been in the money.

STRICTLY BUSINESS AND DOCTOR C. were cast off at 3:15. Doc in open field made game on a single bird, which he flushed. Next he flushed a bird and was inclined to chase. Working on scattered birds marked down in a thicket, Strictly Business flushed and chased a single. Doc flushed a single in briers. He then worked on a half-grown bird in weeds, which was flushed excusably. Up at 4:24.

FANNIE ALLEN AND ALLIE B. began at 4:47 and had the best hour of the day for good work, and better and more opportunities for work than had any other brace, but they failed to take advantage of their opportunities to a regrettable degree. Fannie flushed a single of a bevy, moved on, and then Allie came around and flushed the bevy, all this in good ground under favorable conditions for good work. The birds were followed into a thicket, where several were flushed, but owing to thick cover it was impossible to note the circumstances of the flushes. Allie in the open flushed a bevy riotously. In the thicket Fannie pointed a single. Both dogs lost a number of good opportunities on singles.

The judge announced that all dogs should be on hand in the morning.

Thursday.

The morning opened warm and the temperature increased as the sun mounted skyward till it reached a point of warmth which seemed of the summer time. It was again too warm for good work to be possible, yet more birds were found than on the preceding day, though, as then, they were tame and indolent and small, as were most of those found during the trials. The work was limited so far as it referred to points and range and finding.

Third Round.

LORETTA AND LANG were started at 8:30. After awhile a quail was seen calmly sitting on a fence and the dogs were worked toward it. Loretta caught scent of the bevy close by, was over eager and flushed unintentionally and was steady. Next she pointed a single. Lang flushed a single in corn. Lang's range was too narrow to be of use and he loafed a good bit. Loretta made a fairly good showing, better than that of the previous day, though her work was still lacking in finish. Up at 9:05.

FANNIE ALLEN AND DOC C. worked diligently without finding from 9:32 to 10:08, Doc showing the better judgment, Fanny being puppyish.

Fourth Round.

ALLIE B. AND LORETTA were cast off at 10:31. Loretta roaded to a flush on a bevy in the open. The birds were followed. Allie showed riotous inclinations. Loretta flushed and was steady to wing. Allie was taken up for a few minutes to give Loretta chance to point birds. She flushed a single. Allie was again put down. Next Allie flushed a bevy in woods. Both ranged moderately well. Up at 10:58.

STRICTLY BUSINESS AND FANNIE ALLEN began at 11:15. Some birds were marked down. Fannie made a point on two or three birds and afterward refuse to go from heel, seeming to be timid. The work was far short of the opportunities. Up at 11:43.

This heat completed the competition of the Derby.

The All-Age Stake.

There were fifteen starters drawn to run in the following order:

Richard V. Fox's b., w. and t. setter bitch (Gath's Mark—Countess Rush), owner, handler, with L. Craven's b. b. setter dog Spot (Noble Sting—Snowball), H. Christ, handler.

S. B. Cummings's liv. and w. pointer dog Scott C. (——— — ———), owner, handler, with F. D. West's l. and w. pointer dog Max (Swart's Duke—Polly G.), owner, handler.

G. O. Smith's b., w. and t. setter dog Whyte S. (Whyte B.—Moses Clara), J. W. Phillips, handler, with Herman Straus's o. and w. setter dog Flash B. (Dion C.—Galatea), S. B. Cummings, handler.

Richard V. Fox's b., w. and t. setter dog Iroquois (Antonio—Can Can), owner, handler, with G. Wm. Lang's b., w. and t. setter dog Roger O'Mara (Roger Boy—Nancy Mahoning), Geo. Battison, handler.

W. H. Beazell's o. and w. setter bitch Hoosier Girl (Dad Wilson—Daisy Hunter), J. Bell, handler, with G. O. Smith's liv. and w. pointer dog Spot Gold (King Pedro—Ridgeview Venus), owner, handler.

W. D. Hewey's liv. and w. pointer dog Geo. Croxteth (Don Croxteth—Mollie Scott), W. D. Henry, handler, with Anderson Bros.' l. and w. setter bitch Bev. R. (——— — ———), H. Christ, handler.

S. B. Cummings's o. and w. setter dog Galert C. (Duke of Princeton—Ione), owner, handler, with Henry Christ's liv. and w. pointer dog Roy Croxteth (Shot Masher—Croxteth Nellie), H. Christ, handler.

S. W. Hart's b. b. and t. setter dog Beaconsfield (Gladstone's Boy—Bessie Marshall), J. Schaumm, handler; a bye.

Iroquois, the winner of first, was far away the best ranger in the stake. He beat out a great deal of ground, though he received much directing from his handler which he would have been better without. In cover he was particularly difficult to handle, and his finding and point work were not deserving of any special praise, considering his opportunities. Still, as mentioned before, it was a difficult task for a dog to make a good showing under the existing conditions of rank cover, tame young birds and hot weather. To make his record fuller, it might not have been amiss for the judges to have put him down alone among scattered birds when good opportunities offered, and thereby added to his score of points, for though pointing is not everything, it is a very important part of a field performance, whether in or out of competition. Had there been any dog near his class in other qualities, it would have been necessary to have had more point work.

Scott C., second, did some reliable point work, and while he did fair work in other respects, it was far below expert performance.

Accelerando and Geo. Croxteth divided third, and both made a good, commonplace showing, and their winning was more from the absence of good competition than the merit of their performance.

ACCELERANDO AND SPOT began at 12:59. The former pointed some tame chickens and the latter backed to order. On some scattered birds, which were marked down, Accelerando pointed well on a single and Spot backed to caution; the former was not steady to shot. Spot was a narrow ranger. Accelerando had good speed and a moderately good range. 1:43.

SCOTT C. AND MEX began at 1:53. Scott pointed a bevy nicely. Mex joined in the point. On the scattered birds, Scott flushed one, then pointed a remaining one, and sent on, he pointed again well. On birds of another bevy marked down, Scott was first to point. The birds were running slowly and their low, musical whistle could be heard plainly. Mex crossed the fence and pointed the birds; Scott backed. The birds flew to the roadway close by. Scott pointed and Mex flushed the bird ahead of the former. Moved on, Scott pointed, Mex went by, roaded rapidly down a furrow by the roadside and caught the half-grown bird. Up at 2:37. They had a middling fair range and good speed, though it was more in being well sustained than in swiftness.

WHYTE S. AND FLASH B. started at 3:10. Flash pointed a bevy nicely and steadily. Up at 3:58. Both were moderate rangers, but worked diligently, though they showed some fatigue toward the close of the heat.

IROQUOIS AND ROGER O'MARA began at 4:08. Roger pointed a single bird stanchly and nicely, Iroquois backed; both were steady to shot. Iroquois showed good speed and range, but as both handlers were walking as if in a walking match it is difficult to say what the dogs might have done had they been hurried less. Time 5:22, and the day's work ended.

Friday.

As the start was made from headquarters rain set in and there was little hope for a good day, but soon after the dogs were started the clouds broke away, the sun shone clear and bright and what seemed a summer temperature again prevailed. Coats were strapped to saddles and costumes lightened, yet the company flushed and perspired, particularly those who were afoot.

HOOSIER GIRL AND SPOT GOLD began at 8:53 and ran 47 minutes, nothing found. Neither one showed any particular merit.

BEV. R. AND GEO. CROXTETH began at 9:52. Croxteth roaded to a bevy and pointed it in an open field, Bev. joining in the point. The birds were followed into woods, where both pointed. Bev. was unsteady to shot. Bev. flushed a bevy. Up at 10:48.

GALERT AND ROY CROXTETH started at 10:53. Galert made a bad flush on a bevy. The birds were followed. Roy pointed a single, at the same time Galert in bushes flushed. While his handler was getting a cartridge out of some tangled recess in his clothes Roy moved on and the bird was flushed afterward where he had pointed. Galert pointed a single and was steady to shot. Next he pointed a single alongside a fence in corn and Roy refused to back. Galert made two more points stanchly. His range was close. The pointer's work was poor. Up at 11:30.

BEACONSFIELD ran a bye, beginning at 11:35. In corn he pointed a bevy and was steady to caution. He flushed a bevy, and on the scattered birds he stopped to a flush and pointed a remaining single, and at the report of the gun he broke in. He was tired when ordered up at 12:29.

After lunch the judges called for four dogs, as follows:

Second Round.

IROQUOIS AND SCOTT C. were cast off at 1:13. Iroquois pointed a single in briers. Scott pointed a small bevy in an indifferent manner in the open. Iroquois showed far away the best speed and range. Though Scott was diligent, his range was hardly middling, and he needed attention to keep him out at his work. Iroquois, however, was disobedient and hard to handle, particularly so on single birds. He carried himself with dash, and was swift of pace and covered a great deal of ground.

ACCELERANDO AND GEORGE CROXTETH were cast off at 2:05. It was a heat of lost opportunities on a bevy and scattered birds. The pointer had a moderate range, Accelerando something better in that respect. Up at 2:32.

Third Round.

GALERT C. AND WHYTE S. began at 2:55. Down 31 minutes. Both made game and moved on. They were hurried on and one of the judges flushed a bevy near where the dogs made game. Galert pointed one of the scattered birds and Whyte S. flushed one and chased it in a calm manner. This heat ended the running.

FIELD TRIALS OF THE NATIONAL BEAGLE CLUB.

HEMPSTEAD, New York, was the scene of the seventh annual field trials of the National Beagle Club. They were held Oct. 26–30 and were very successful, both in the number of entries and the quality of the beagles entered. The judges were Charles Quynn, Frederick, Md., and Bradford S. Turpin, Roxbury, Mass. Their awards were well received. Rabbits were hard to find, but those that were put up were excellent runners and never went to ground. The club headquarters were at Roth's Hotel, where all were well taken care of. Hot lunches were daily served in the field.

Among those at the trials were H. F. Schellhass, J. W. Appleton, G. W. Rogers, New York, N. Y.; John Bateman, Gravesend, N. Y.; A. D. Lewis, J. L. Kernochan, Hempstead, N. Y.; G. B. Post, Jr., Bernardsville, N. J.; Geo. F. Reed, Barton, Vt.; N. A. Baldwin, East Orange, N. J.; D. F. Summers, Thorndale, Pa.; A. C. Pickhardt, Massapequa, N. Y.; G. M. Wharton, East Islip, N. Y.; Howard Almy, Providence, R. I.; C. Staley Doub, Chas. Quynn, Richard Cramer, Frederick, Md.; H. S. Joslin, Oxford, Mass.; H. L. Kreuder, S. Z. Demarest, Nanuet, N. Y.; G. Muss-Arnolt, Tuckahoe; N. Y.; F. Hoyt, H. A. Purrington, Stamford, Conn.; Geo. Laick, Tarrytown, N. Y.; A. P. Vredenburgh, New York, N. Y.

Monday.

The day was clear and cool. The morning was occupied in measuring the hounds and the field work did not begin till afternoon. Class C was finished, but the work was uninteresting, as scent did not lie and game was hard to find.

CLASS B.—BEAGLES 13IN. AND UNDER.

The drawing for the first series resulted in running Hempstead Beagle's g. and t. dog Leader (Monitor—Lawless), handler, J. L. Kernochan, with Howard Almy's b., t. and w. bitch Skip II. (Buckshot—Jute), handler, owner.

George F. Reed's b., w. and t. bitch Snifter R. D. (Wanderer—Triumph), handler, owner, with Howard Almy's b., w. and t. bitch Nancy Lee (Fitzhugh Lee—Jude), handler, owner.

The bye was drawn by Waldingfield Beagle's b., w. and t. bitch Imported Blue Bell, handler, D. F. Summers.

LEADER—SKIP II.—Down in a weed field near the Lewis place at 2:00. Two rabbits were started during the race and Leader proved himself superior to Skip. There was a short sight chase in the open, but the work was mostly dull and uninteresting. Down 30 minutes.

SNIFTER R. D.—NANCY LEE.—Down in a brush field at 2:34. Nancy did some uneven driving, but Snifter was thinking of the Vermont hills and the white hares and would not condescend to notice the conys. Up at 3:34.

BLUE BELL.—The bye was run with Leader for half an hour, but the little lady was handicapped by her owner's absence and would not hunt. Leader, however, did some creditable driving.

Second Series.

LEADER—NANCY LEE.—These were the best two dogs in the stake, and were put down to run for first and second prizes. Nancy hunted out her ground better than her competitor and was under excellent control. Three rabbits were started, but none of them were driven for any distance. Down one hour.

The judges awarded first prize, $25, to Nancy Lee, and second, $15, to Leader, and reserve to Skip II.

Annual Meeting.

President Schellhass called the meeting to order at 8:20, with twelve members present. H. S. Joslin, Oxford, Mass.; H. T. Peters, New York; E. W. S. Pickhardt, Cambridge, Mass., and A. J. Burrington, Stamford, Conn., were elected to membership. The election of officers resulted as follows: President, H. F. Schellhass; Vice-Presidents, J. W. Appleton, G. B. Post, Jr., A. W. Post; Treasurer, Geo. Laick; Secretary, G. W. Rogers; Executive Committee, John Bateman, G. M. Wharton, N. A. Baldwin; Delegate to A. K. C., H. F. Schellhass; Official Judges, John Davidson, Geo. F. Reed, W. S. Clark, Geo. Laick, H. F. Schellhass, G. B. Post, Jr.

A die for a handsome club medal was presented by a member of the club and accepted with thanks. Adjourned.

Tuesday.

The day was as beautiful as the hunt was unsatisfactory. The first series in Class C was completed.

CLASS A, BEAGLES 15 TO 13IN.

The nine entries in the class were drawn to run in the first series as follows:

Somerset Kennels' b., w. and t. bitch Imported Bownby, handler, J. W. Appleton, with Rockland Beagle Kennels' b., w. and t. bitch Blanche (Frank Forest—Ina), handler, H. L. Kreuder.

Howard Almy's w. and t. dog Lewis (Bannerman—Parthenia), handler, owner, with Wharton Beagle's b., w. and t. dog Stocky (Fitzhugh Lee—Parthenia), handler, G. M. Wharton.

Geo. F. Reed's b., w. and t. bitch Nell R. (Ned—Haida), handler, owner, with Hempstead Beagle's b., w. and t. bitch Purity, handler, Thos. Gibson.

Hempstead Beagle's b. and w. dog Messenger (Monitor—Graceful, handler, J. L. Kernochan, with Pottinger Dorsey's b., w. and t. dog Pilot (Imported Chimer—Belle of Woodbrook II.), handler, owner.

D. F. Summers's b., w. and t. bitch Lucy S. (Frank—Tip) drew the bye.

BOWNBY—BLANCHE.—The latter was easily the better of the couple, and in a short drive had it all her own way. Down 45 minutes.

LEWIS—STOCKY.—This brace had a long and tedious hunt for fur, but not a trace of it was found. Two cats were started by Stocky, and later he went off on a fox, and also tongued on squirrels. The hounds were put down three times in the attempt to get them on a rabbit together. At last success crowned our efforts, and Lewis quickly showed himself to be the better hound, working the losses with care and judgment, while Stocky was wild in his work. Down in all, 3½ hours.

NELL R.—PURITY.—Two rabbits were put up, and Nell ran both prettily. Purity backed to her, but did not tongue, and when put down alone refused to hunt. Down 45 minutes.

MESSENGER—PILOT.—Two rabbits were found, and Pilot won with ease. Messenger, however, proved to be a stylish, ambitious worker, and a very promising hound. Down 30 minutes.

LUCY.—The bye was ordered down with Nell R. as a running mate. A rabbit was soon found, and in the open both did some pretty trailing. Working into the swamp, scent lay well, and a great race was run. The music was fine, but that was the only part of the run on which judgment could be passed, for it was impossible to follow the hounds. Down 2 hours.

Wednesday.

A fine hunting day. New grounds were tried and they proved to be very good, with a fair supply of rabbits. The 15in. class was finished and four braces in the Derby run off.

NELL R.—LUCY S.—A hot race was run by this lively pair. Lucy was a trifle quicker in catching the turn, and during the last of this chase did most of the leading. Down 45 minutes.

Second Series.

LEWIS—BLANCHE.—They were closely watched and ran a pretty race. Blanche was a little the faster and in other respects fully the equal of her rival.

PILOT—LUCY S.—Another hot race and one of the best of the day. Pilot was in better condition for hard running than Lucy and won after a splendid exhibition of beagle work.

Third Series.

NELL R.—BLANCHE.—Nell outran Blanche and won easily.

This finished the work in class A and the judges gave first prize, $45, to Pilot; second, $30, to Lucy S.; third, $20, to Nell R.

The Derby.

The first series in this stake was drawn as follows:

H. S. Joslin's b., w. and t. dog Trick (Clyde—Lady Novice), handler, owner, with George F. Reed's b., w. and t. dog Scorcher R. D. (Wanderer—Triumph), handler, owner.

H. S. Joslin's b., w. and t. bitch Whaler (Wanderer—Triumph), handler, owner, with Howard Almy's b., w. and t. bitch Miss Quinn (Diamond—Nancy Lee), handler, owner.

Rockland Beagle Kennels' b., w. and t. dog Buckshot, Jr. (Buckshot—Blanche), handler, H. L. Kreuder, with D. F. Summers's b., w. and t. bitch Belle S. (Clover—Lucy S.), handler, owner.

D. F. Summers's b., w. and t. bitch Minnie S. (Clover—Lucy S.), handler, owner, with J. O. Frost's b., w. and t. bitch Gladness (Blue Jacket—Cheerful), handler, J. W. Appleton.

D. F Summers's w. and t. bitch Summers's Fly (Clover—Lucy S.), handler, owner, drew the bye.

TRICK—SCORCHER.—Two rabbits were put up. Neither hound hit the track of the first, but Trick drove the second well. Scorcher harked to him, but did little work and lost the race. Down 55 minutes.

WHALER—MISS QUINN.—The former was under no control and the latter was unwilling to leave her handler till a rabbit was put up. Then she drove very well, but at a slow pace, for some distance. Whaler did not get on. Down 1¼ hours.

BUCKSHOT, JR.—BELLE S.—The latter proved to be a flyer, and ran altogether the fastest and best race of the trials up to this time. Three rabbits were put up. The first was lost almost before he started. The second was driven at a killing pace for a long distance, when the fun was spoiled by a boy who deliberately fired at Belle with a small rifle. Fortunately he missed her, but richly deserved to be brought before the police court, which, however, was not done. The last rabbit led a splendid chase in cover. Belle was altogether too fast for Buckshot, and she was an easy winner. Down 1½ hours.

MINNIE S.—GLADNESS.—At first Gladness did the better work, trailing prettily across an open field when Minnie seemed unable to lift the scent. Then Minnie struck the trail in cover far ahead of Gladness, and the latter was not in the race thereafter, as she refused to hark. Down 30 minutes.

In the evening the club was entertained at a dinner party given by Mr. Pickhardt at his residence in Massapequa. It goes without saying that the evening was a jolly one.

Thursday.

The day was clear and very warm. The running in the Derby and Futurity Stakes was completed.

SUMMERS'S FLY.—BUCKSHOT, JR., was put down to run with Fly. The latter did most of the work, and showed keen nose and greater speed than her running mate. Down 1 hour.

Second Series.

BELLE S.—TRICK.—These youngsters ran one of the prettiest races of the trials on a rabbit which ran straight away for a mile or more. The hounds were very evenly matched, and there was but little to choose between them. A second rabbit was put up and driven beautifully for some time, and the hounds were ordered up while still running. Down 1 hour.

Belle S. was given first prize, $20, and Trick second, $10.

The Futurity.

In the first series the beagles were drawn to run as follows:

Rockland Beagle Kennels' b., w. and t. dog Buckshot, Jr. (Buckshot—Blanche), whelped Jan., '95, handler, S. Z. Demarest, with Geo. F. Reed's b., w. and t. dog Millard R. (Millard—Haida), whelped July, '95, handler, owner.

D. F. Summers's b., w. and t. bitch Belle S. (Clover—Lucy S.), whelped March, '95, handler, owner, with Geo. F. Reed's b., w. and t. bitch Scorcher (Wanderer—Triumph), whelped April, '95, handler, owner.

D. F. Summers's b., w. and t. bitch Minnie S. (Clover—Lucy S.), whelped March, '95, handler, owner, with Howard Almy's b., w. and t. bitch Miss Quinn (Diamond—Nancy Lee), whelped Aug., '95, handler, owner.

BUCKSHOT, JR.—MILLARD R.—The latter proved to be the better hound in hunting out his ground and driving his game. He is also the possessor of a sweet, tuneful voice, a point which is overlooked by most of our breeders. Down 1 hour.

BELLE S.—SCORCHER.—The former was an easy winner. Scorcher appeared indifferent. The small rabbits are new game to him, as he has always been hunted on white hares. Down 45 minutes.

MINNIE S.—MISS QUINN.—The latter gave a pretty exhibition of trailing and won without difficulty. Down 48 minutes.

Second Series.

MILLARD R.—MISS QUINN.—Millard had more speed and as good a nose as Miss Quinn and won. Down 12 minutes.

MILLARD R.—BELLE S.—A pretty race in full view of the spectators was run by this fine brace. Belle won. Down 25 minutes.

The value of the stake was $75.50. The judges gave first prize, $30.20, to Belle S; second, $18.88, to Millard R.; third, $11.32, to Miss Quinn; reserve to Minnie S. Ten per cent. of the Futurity, $7.55, went to D. F. Summers, the breeder of the first winner.

Champion Stake.

There were but two entries in the stake: Pottinger Dorsey's b., w. and t. dog Pilot (Imported Chimer—Belle of Woodbrook), handler, owner; and Rockland Beagle Kennels' blue-ticked dog Buckshot (Deacon Tedd—Daisy), handler, S. Z. Demarest.

PILOT—BUCKSHOT.—They were put down for fifteen minutes, and as no start was made were ordered up to go down again.

Friday.

A good hunting day. The trials were finished.

PILOT—BUCKSHOT.—Neither hound was under good control. Two rabbits were started, and Pilot proved himself to be the better hound in casting and hunting his ground. In speed they were about equal. Down 1 hour and 23 minutes. The judges awarded first prize to Pilot, and second to Buckshot.

Pack Stake.

Three packs were run, and the stake was an interesting one.

HEMPSTEAD BEAGLES.—Tyrant, Trueman, Messenger and Leader made the pack. They were under good control, and had the best voices heard at the trials. A rabbit was started and quickly lost. Down 45 minutes.

SUMMERS'S PACK.—The pack was composed of Lucy S., Minnie S., Belle S. and Summers's Fly. The drive was a long, hard one, and a fine example of beagle work. The hounds packed well, worked merrily, and were snappy and active. Down 1 hour and 25 minutes.

ROCKLAND BEAGLE KENNELS' PACK.—In the pack were Buckshot, Buckshot, Jr., Blanche and Zillah. A rabbit was quickly put up, and after a short run was lost at a road. Down 30 minutes.

The judges gave first prize to Summers's Pack, second to Rockland Beagle Kennels, and reserve to Hempstead Beagles.

The conclusion of this stake brought to an end a very successful trial. J. A. B.

Continental F. T. C.'s Trials.

OCT. 24.—*Editor Forest and Stream:* The Continental Field Trials Club and the dog owners and handlers of America are placed under renewed obligations to the Mobile & Ohio Railroad as the letter herewith inclosed, just received from its efficient General Passenger Agent, Mr. E. E. Posey, will show. In all of my dealings with and trips over the road I have invariably found the officials and employees gentlemen in every sense of the word; I have found the road bed first-class and the train service perfection. It always appeared to me that the trainmen considered it a pleasure instead of a duty to cater to the wishes and comfort of their passengers. I therefore take pleasure in recommending the Mobile & Ohio road to the traveling public. P. T. MADISON.

COPY.

MOBILE, Ala., Oct. 20.—*P. T. Madison, Esq., Sec'y-Treas. Continental Field Trials Club.*—Dear Sir: I am advised by Mr. J. N. Seale that you recently favored him with a few days on our line, and that you have selected Tupelo, Miss., and vicinity for the field trials of the Continental Club next season.

I regret exceedingly that I was not advised in advance, so that I could have joined you and Mr. Seale on your trip of investigation, as I would have enjoyed greatly not only the outing, but the pleasure of meeting you, and would have been pleased to have had an opportunity to show you some personal courtesies.

I congratulate you upon having selected Tupelo as a location for your field trials, and predict that it will mean not only permanent location with you, but success, pleasure and satisfaction to your members and those interested in your trials. You will find the people hospitable, and the railroads (the Mobile & Ohio prominently) are willing to do everything they can to afford your members, friends and other visitors to your trials every facility and accommodation that we can in rates and service. You will also find birds as plentiful in this section, if not more so, than in any other, which is the most important point, and a country that is just suited to the sport at the proper season of the year.

In making your arrangements for your field trials, be certain to advise me fully in advance, giving particulars, and we shall be glad to coöperate with you in any way we can to properly take care of your people. Have trainers and handlers communicate with us in advance, so we can arrange to take care of them in good shape. I shall make a special effort to be present at your trials this winter, and hope sincerely to have the pleasure of meeting you.

Again congratulating you and assuring you of my great pleasure at your selection, and extending to you our heartiest welcome, and an earnest assurance of coöperation on the part of the Mobile & Ohio R. R. in all details that go to make field trials a success, I beg to remain, Yours very truly.

E. E. POSEY, G. P. A.

The Water Fowl Club of America.

EAST ORANGE, N. J., Oct. 31.—*Editor Forest and Stream:* By same mail under separate cover I send you a copy of the Water Fowl Club catalogue. You can gather from it that the membership is not a large one, still they are a pretty nice set of fellows and are banded together purely with the hope of doing something for the industry generally. I therefore trust you will help us as much as possible by giving us any publicity within your power. T. FARRER RACKHAM.

No Thanksgiving Show in Newark.

WILL you please announce that after the most strenuous efforts to hold another show at Newark Thanksgiving week, it has been finally decided to abandon it for the present. EDWIN H. MORRIS, Sec'y.

POINTS AND FLUSHES.

Under date of Oct. 30 we have received from Mr. Oldham, sec'y of the Metropolitan Kennel Club, a report of the club's meeting held on Oct. 21, but while such promptness is most commendable it still is too late to be of value.

Mr. S. C. Bradley, secretary of the E. F. T. C., informs us that he will arrange for the entertainment of visitors at the club's forthcoming trials (Nov. 16) aside from the main interest, the competition; and for that purpose will have traps and clay pigeons for those who care to test their skill in that manner, so do not neglect to take your gun. Other diversions will also be provided. On behalf of the club, Mr. Bradley extends a cordial invitation to sportsmen to visit the club's trials. It is the oldest club in the country, and has weathered all the ups and downs of field trials through all the years.

KENNEL NOTES.

Kennel Notes are inserted without charge; and blanks (furnished free) will be sent to any address. Prepared Blanks sent free on application.

SALES.

F. L. Cheney has sold
One dog puppy to Mr. Jas. B. Blossom.
One dog puppy to Mr. Jas. Wrinkle.
One bitch puppy to Mr. Jas. Wrinkle.
Alice Kent to Mr. Jas. Wrinkle.

Wheeling.

Communications for this department are requested. Anything on the bicycle in its relation to the sportsman is particularly desirable.

WHEELING NOTES.

In the United States Signal Service a number of bicycles are in use, principally among the linemen. Though Gen. Miles has spoken so strongly in favor of the wheel for army use and recommended the equipment of a regiment, no official purchases have been made. The cycle corps of the Twenty-fifth Infantry were equipped with wheels secured by Lieut. Moss from a public-spirited manufacturer, and those used in the courier service and cross-country runs are the property of the individual riders.

While the sentiment is distinctly in favor of the bicycle for army use, our Government apparently does not propose at present to follow the example of foreign Governments in the matter of outlay for this purpose.

It takes the spur of emergency to make the Government cognizant of any good thing, and in ordinary times that red-taped abstraction is content to let others experiment, justified, no doubt, by the knowledge that when the emergency comes the nation will rise equal to it.

At the annual field day of the Second Regiment of the Massachusetts Militia at Sugar Loaf Mountain, South Deerfield, Mass., the bicycle was put to a severe test under unfavorable weather conditions.

A reconnoissance was made by corps from three companies with a total strength of ninety men. Fifty-four of the men were under command of Capt. McDonald, of Company B, of Springfield, while the other detachments included twenty-four members of Company C under Lieut. Gilmour, and twelve men from Company D under Lieut. Field.

The soldiers made a very rapid scout through the surrounding country, and in a short time reported on its condition topographically, and with reference to its ability to sustain troops by means of foraging. From these reports Capt. McDonald was able to make a very fair map of the region.

The reconnoissance was completed in much better time by the wheelmen than it could have been accomplished by cavalry, and the results were so eminently satisfactory that Adjutant-Gen. Dalton will probably have similar maneuvers introduced in the field days of other regiments.

The French soldiers just now are developing the possibilities of their folding military bicycle, and the general verdict is that the wheel is a complete success. In the recent army maneuvers the bicycles were packed and loaded on the soldiers' backs fifty seconds after the order for dismounting had been given, and at the end of a march on foot the wheels were ready for use in forty seconds. On one occasion a company of bicyclists were dispatched to turn the flank of opposing cavalry by using a hilly path through woods, impassable to the latter. They made their way successfully to the place assigned, surmounting or clearing away obstacles to their progress, and opening fire on the opposing cavalry force, forced it to abandon the position it was holding. The use of bicycles for the rapid transportation of troops to the flanks of an enemy's army will undoubtedly be one of the features of modern warfare, and no general can afford to leave it out of his calculations.

The old lines affectionately descriptive of G. W. might almost be applied to the bicycle—first in war, first in peace, and first in the hearts of our nineteenth century civilization.

The bicycle corps will be the future military commander's right bower, a flying power for offense or defense, bringing its men on the field fresh and spirited where infantry would be fagged and worthless, easily handled because the same number of men can be gotten under way in a tenth part of the time that it takes with foot soldiers.

In peace the bicycle leads by reason of the magnitude of the industry from a financial point of view, and concerning the affectionate regard in which it is held there can be no question as to its supremacy.

Babies nowadays cry for bicycles. Children demand them for Christmas presents, where they used to ask for watches or other less necessary things that they are now content to dispense with, and older people of all ages, sexes and conditions are its devotees.

Redress for Wheelmen.

JOHN P. HAINES, the President of the American Society for the Prevention of Cruelty to Animals, has mailed an open letter to all New York State bicycle clubs, calling the attention of wheelmen to Section 661 of the Penal Code, which reads as follows:

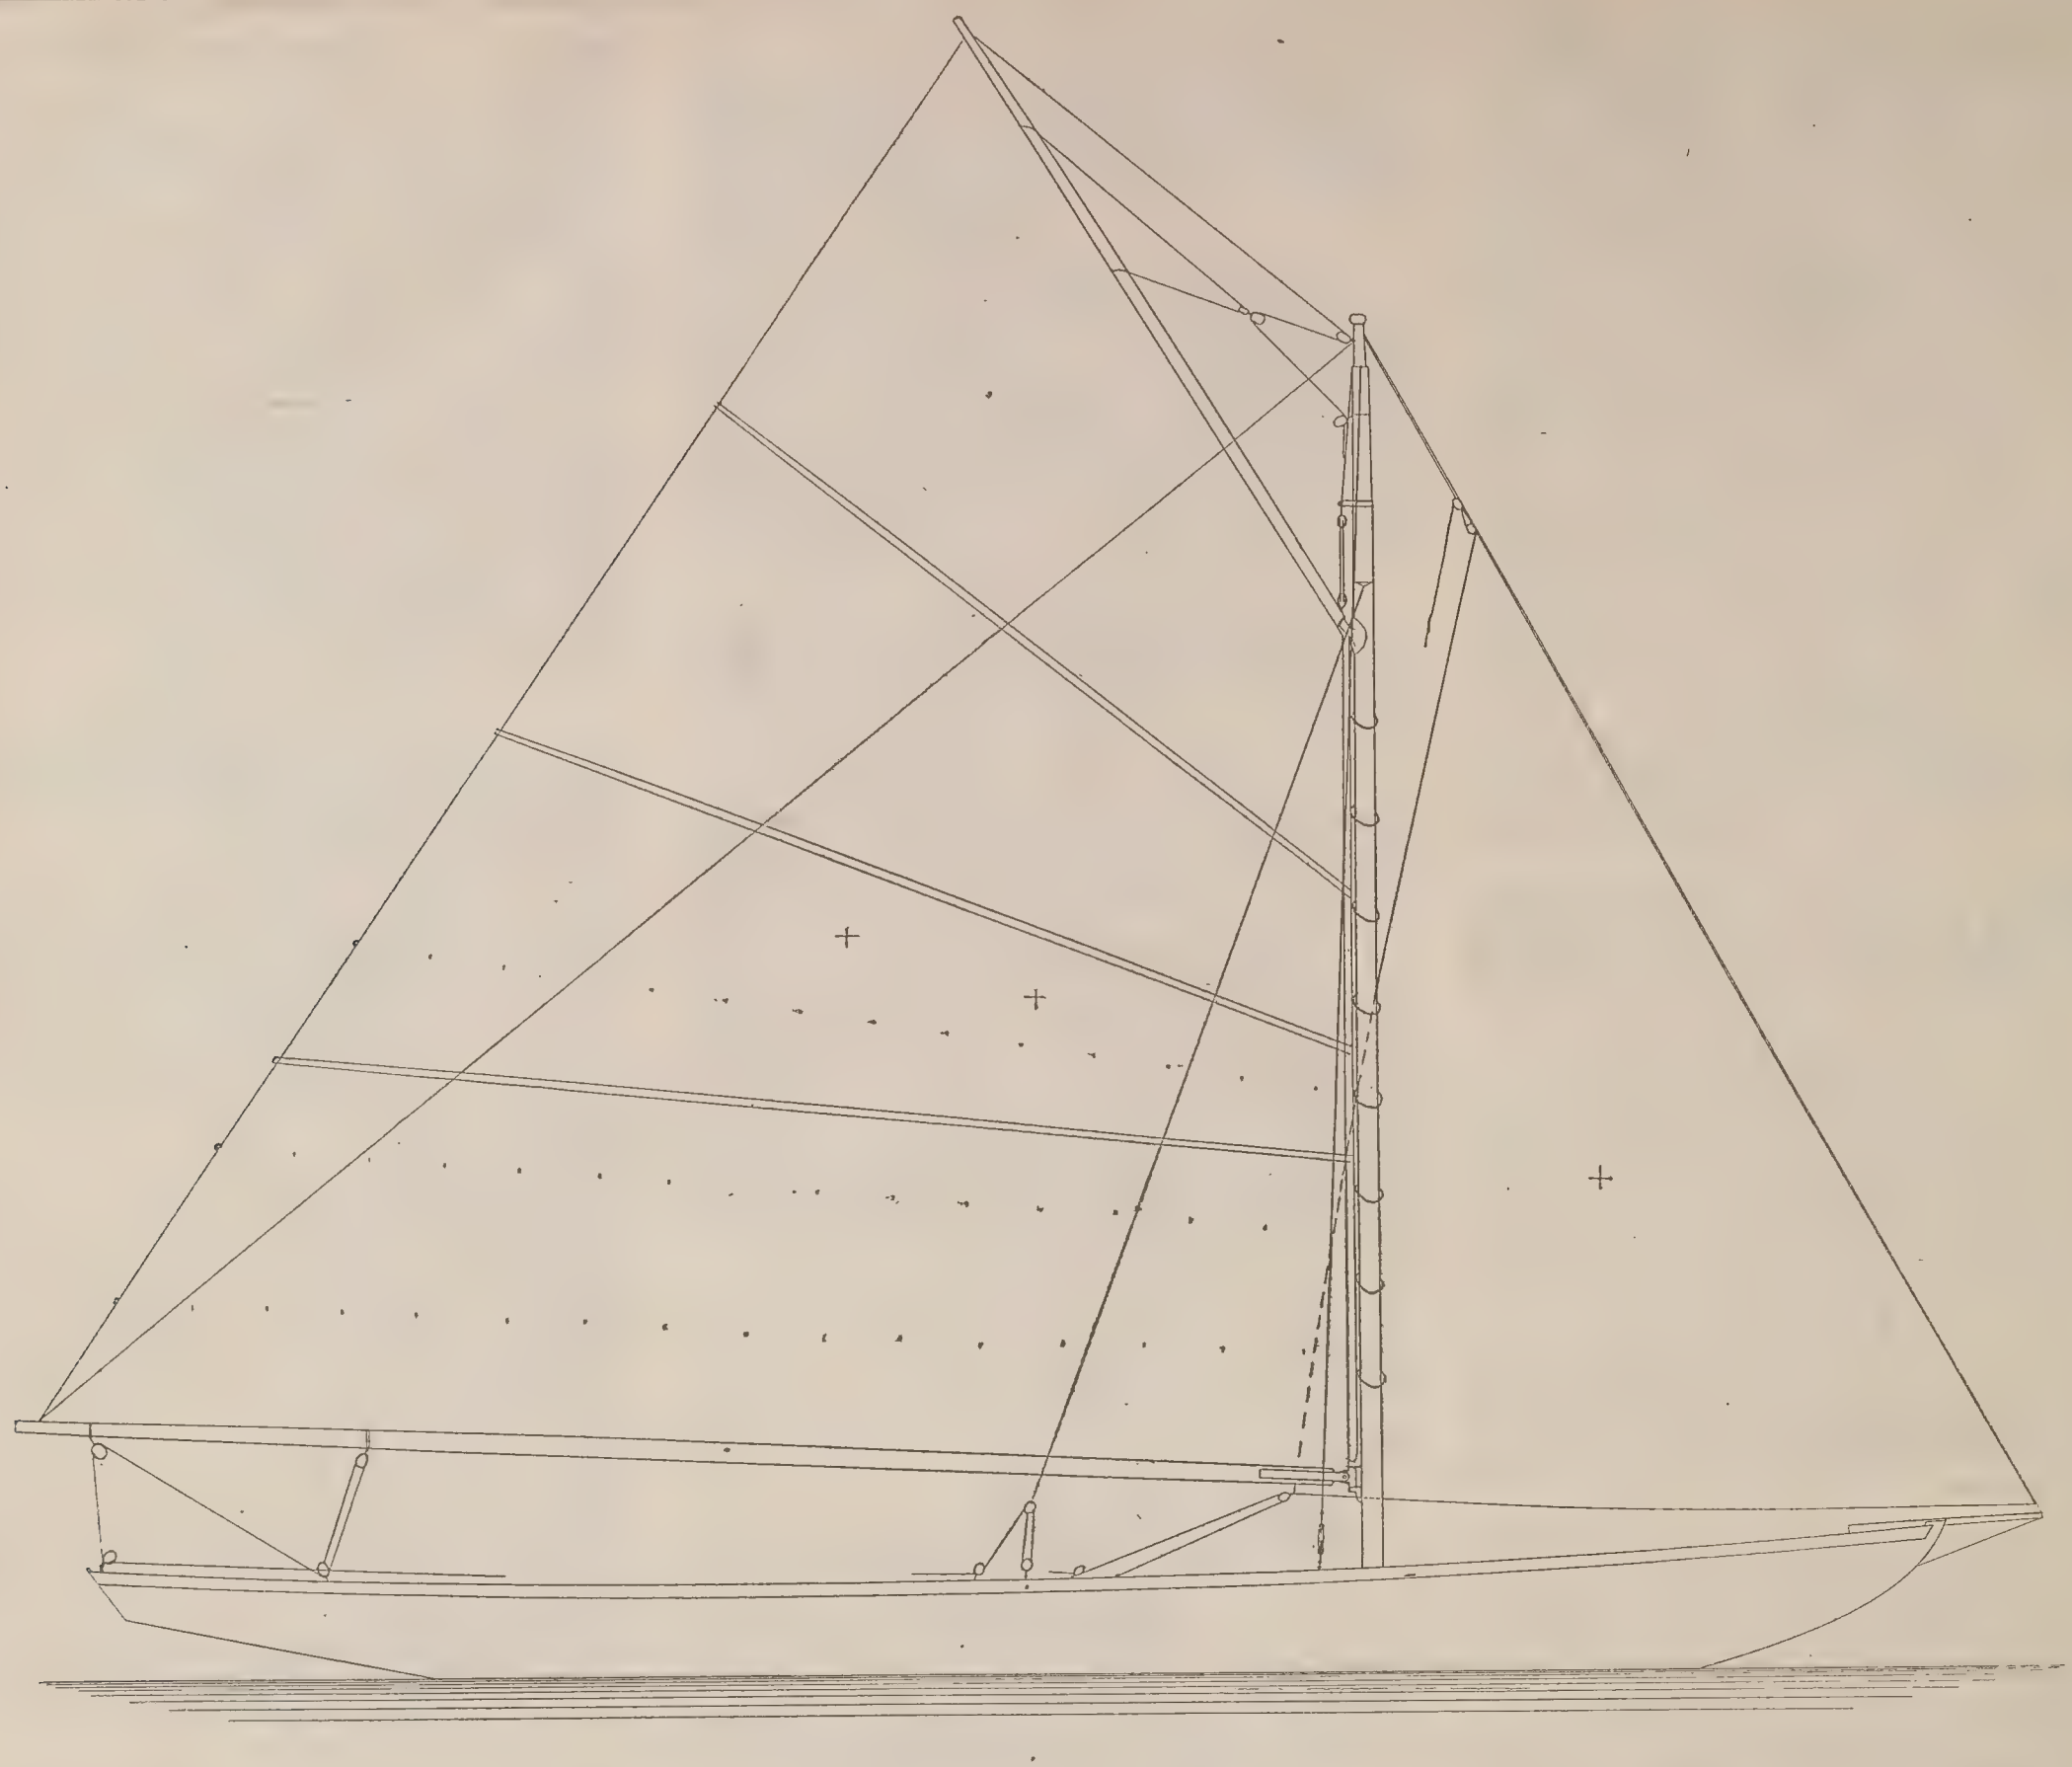
"A person who willfully throws, drops or places, or causes to be thrown, dropped or placed upon any road, highway, street or public place, any glass, nails, pieces of metal or other substance which might wound, disable or injure any animal is guilty of a misdemeanor."

The S. P. C. A. seeks to secure the coöperation of wheelmen throughout the State in the suppression of attempts to injure animals as well as bicycles; and Mr. Haines points out that this section makes it possible to fine violators $500, or to impose a sentence of one year in the penitentiary, or both. He adds:

"The original purpose of the law was to protect animals from wanton or needless injury, and more particularly horses, which traverse the public roads and streets by the hundreds of thousands, and are exposed not only to needless suffering, but also to a frightful death by lockjaw by the practices which this law is intended to suppress. It is evident that the throwing upon public places of any substances which might wound or disable an animal may result in injury to the pneumatic tires now in universal use as a necessary part of the bicycle; but I would call your attention to the fact that, under the general law, there is no adequate or certain remedy for injury to the owner of a wheel which may be injured in that way, since it is always necessary for the injured party to prove that the injurious article or substance was placed upon the road or street with malicious intent to injure property, while the court may go so far as to require proof of an intent to injure the particular wheel which has been damaged. The result of this difficulty is that many wheelmen submit in silence to a malicious wrong which interferes with their pleasure and injures their property rather than undertake the trouble and expense of doubtful prosecution."

Hare and Bicycle.

WHILE galloping through a bottom along the North Platte River in 1886, my horse stepped on and killed a small cottontail rabbit that did not get out of his way quick enough. One of the late issues of the London *Field* tells of a hare being run over and killed by a bicycle rider, and another instance is given where the same thing was only averted by the quickness of the animal. The latter incident is described as follows: "On Sept. 30 a hare was running toward me, in a straight line with my bicycle, jumped into the air with a side wriggle, and cleared my front wheel, landing just at my pedal as I swept past. I was just prepared to see my wheel, and perhaps myself, go over it when it achieved this wonderful performance." B.



Yachting.

A SPECIAL meeting of the New York Y. C. will be held on Nov. 5 to pass for a second time upon the amendments to the racing rules accepted at the last meeting. A new amendment will be introduced providing that existing yachts, while exempted from the draft limits as they stand, shall not be allowed to increase their draft by alteration beyond the limits.

ON Oct. 30 the steam yacht Intrepid, Lloyd Phœnix, returned to New York after a voyage of some 18 000 miles to the Mediterranean and European ports, having left New York on March 20. The voyage is rather a remarkable one for a large steam yacht, in that both owner and captain crossed the Atlantic both ways in the yacht instead of in an "ocean greyhound."

THE present time is the most favorable opportunity for the enactment of new and improved rules that has ever existed in American yachting since racing was established. In the classes above 30ft the old boats are so completely outclassed, and have so generally withdrawn from the racing, that they cease to represent that bugaboo of progress, vested interests. In the single-stick classes the only boats that have kept up a pretence of racing are Queen Mab, Wasp, Uvira and Norota, not one of which will have a fighting chance against a new boat built to the limit of her class. In the schooner classes are just three boats which can be said to represent live vested interests as being new and still in the racing: Colonia, Amorita and Quissetta. The other schooners, Ariel, Lasca, Merlin, Iroquois, Marguerite, Quickstep and Volunteer, no longer represent vested interests in that they have no chance of winning from the three named; and Emerald may probably be included in the latter lot rather than the former.

The various measures for the improvement of the rules now before the various clubs are all based on the assumption, which we hope and believe is well founded, that there is to be a marked revival of building this winter; among the new yachts confidently promised are at least one or two schooners, some new cutters of 70ft. racing length, and four or five of 51ft. It is in every way essential that the new boats should

WENONAH.—SAIL PLAN.

be considered above all the old ones in making new rules, and on this occasion, at least, there is no reason why they may not be. As we have shown, there is nothing in the single-stick class which can reasonably claim to represent a vested interest, and the three schooners can be provided for by special legislation, if necessary, in order to allow them to race for a season or two against the new boats.

To those who have followed the slow course of improvement in American yachting the changes of the past two years are indeed wonderful; the sandbagger has disappeared so quietly that its demise has passed unnoticed, fixed ballast and limited crew and sail area have been universally adopted, the old reaching courses have given place to short triangles sailed several times over, with provisions for stopping a race at the end of a round, and even the one-gun start, so long decried as impossible, has been adopted.

It is impossible to consider the questions of overhangs and waterline measurement without being forced to the conclusion that they are most closely connected, and that the former must be greatly simplified by that solution of the latter which is clearly inevitable—the measurement with crew on board. There can be no question that this must shortly be done in all classes in America just as it has long been done in England, and as it is done here now in the races for the America's Cup and in all the smaller classes.

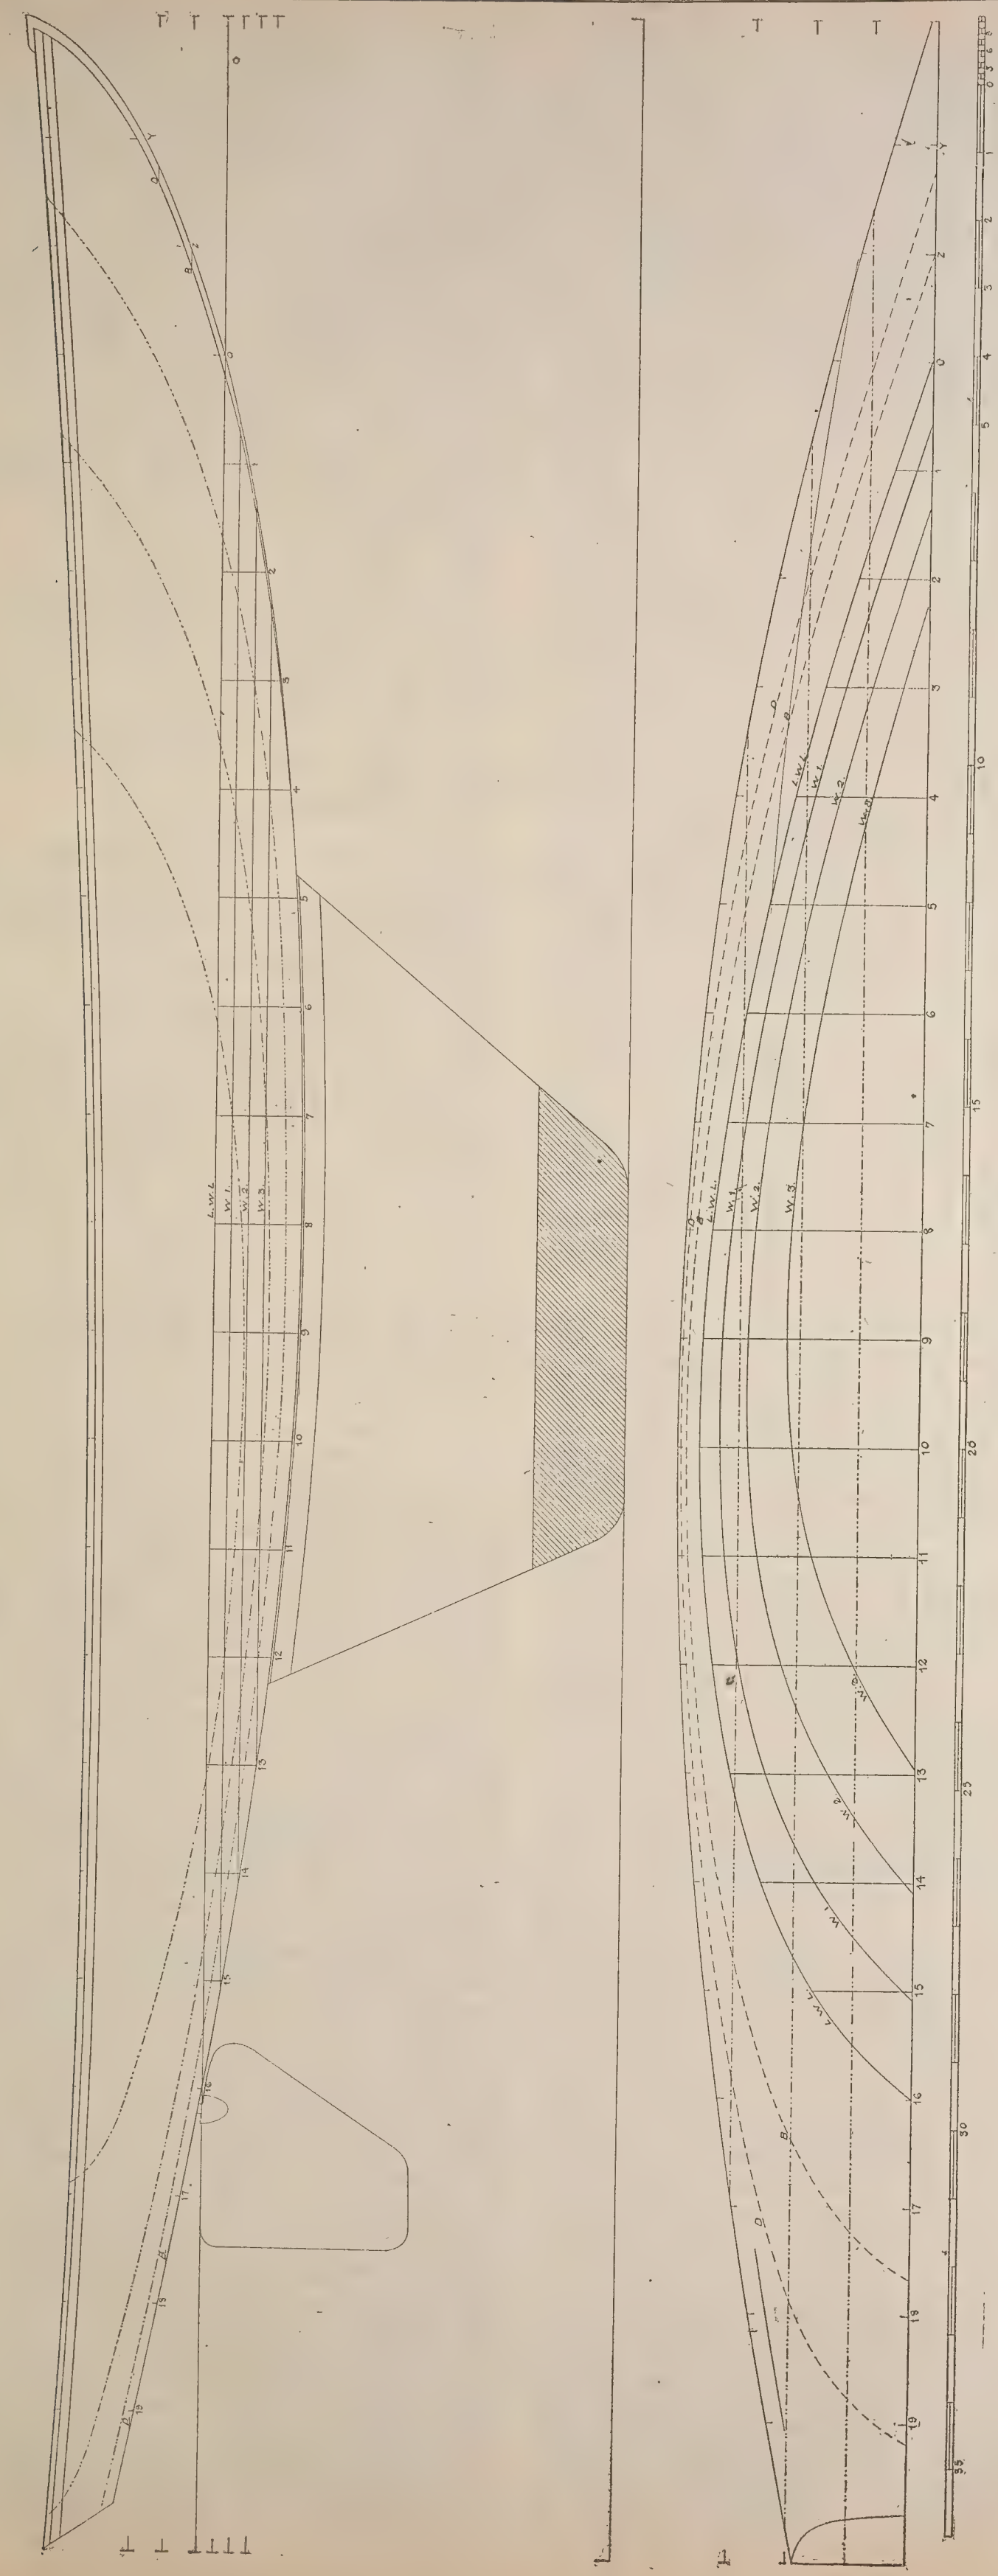
The only reason urged against it is most inadequate: that existing yachts would have to be remeasured, causing much work, and might come out of their classes. Against this we would urge that if new yachts are built they must be designed under the new rules to the extreme limit of their classes, and the designers will do some very close figuring in the matter of weights and waterline in order to waste nothing that is of advantage. It makes no difference whatever to owner or designer whether the new boat be designed for measurement with crew or without crew, so long as the rule is fixed one way or the other; but it will make a very great difference if the rule be changed in the near future, as it plainly must be, and the owners of new boats, built already to the limits of their classes, are obliged to conform to it.

There has been entirely too much hasty and ill-considered legislation of late in yachting, and we hope that before it is too late those who are in a position to exert any influence by vote or otherwise will consider seriously this important question at least. Measurement with crew aboard is inevitable; it must come as surely as uniform classification, uniform rules, one-gun starts and triangular courses have come. Any attempt to ignore it now can only work trouble in the future after new yachts have been built, as it is beyond question that such yachts will be designed to the limits of their classes when measured without crew.

IT is not necessary at this late day to go into lengthy arguments to prove that the only proper way in which to measure a racing yacht is with weights of all kind aboard, in the ballast, and as nearly as possible in the trim in which the yacht actually sails. No other method is so fair to all yachts, so reasonable in itself, or so sure a preventive of evasion or "cheating" of the length measurement. Whether it is enough in itself, or whether it should be supplemented by a measurement at a stated distance above the actual loadline or by some other tax on overhang, is a secondary question, and one that can only be properly discussed on the basis of measurement of waterline in actual sailing trim.

WE publish this week the announcement of the fourth annual meeting of the Society of Naval Architects and Marine Engineers. As usual, a number of valuable papers will be read, and the two days of the meeting will give opportunities for a social reunion that is as useful in its way as the papers themselves. It is gratifying to note the success of an institution which was long needed in this country, and which, now that it has come, is each year giving new evidence of its practical value.

THE Council of the Yacht Racing Union of Long Island Sound has nearly completed the work in which it has been engaged since the ending of the racing season—the thorough overhauling of the racing rules. Though adopted on short notice and in an experimental way, with many concessions to the varying customs of the many organizations which it was proposed to unite, the rules thus far have worked admirably through two seasons of regular racing. So great has been the change of public opinion during that short time in such matters as measurement with crew on board, one-gun starts, etc., that it is not only possible, but absolutely necessary, to revise the rules, and to incorporate some features heretofore unknown in American yachting. In some points, such as the remodeling of the list of classes, the abolition of allowance within the classes, etc., the general nature of the desired improvement has been plainly discernible, and the Council has had only to deal with details. In others, such as the question of limiting draft, overhang and sail, and that of a material alteration of the measurement rule, it has proved very difficult to lay out any general plan that promises to be satisfactory, and as yet no action has been taken.



So far as it has gone, the work of the Council in the form of amendments to many of the rules is most satisfactory. The main ends in view have been the lessening of the number of classes, the strengthening of such classes as have been retained as permanent, the abolition of time allowance and the encouragement of owners to build to the full limits of the classes, and the further perfection of the details of actual management of races. The work has been done to a certain extent in concert with the Larchmont and New York clubs, though neither is a member of the Union, and all of the good features of the changes proposed in those clubs have been utilized; but the Union is prepared to go considerably further than the two clubs, especially in such important points as the measurement with crew on board in all classes and the limiting of yachts to the classes in which they belong, and prohibiting them from racing in others. The changes recommended are now nearly completed and will shortly be published, prior to being submitted to the Union for ratification.

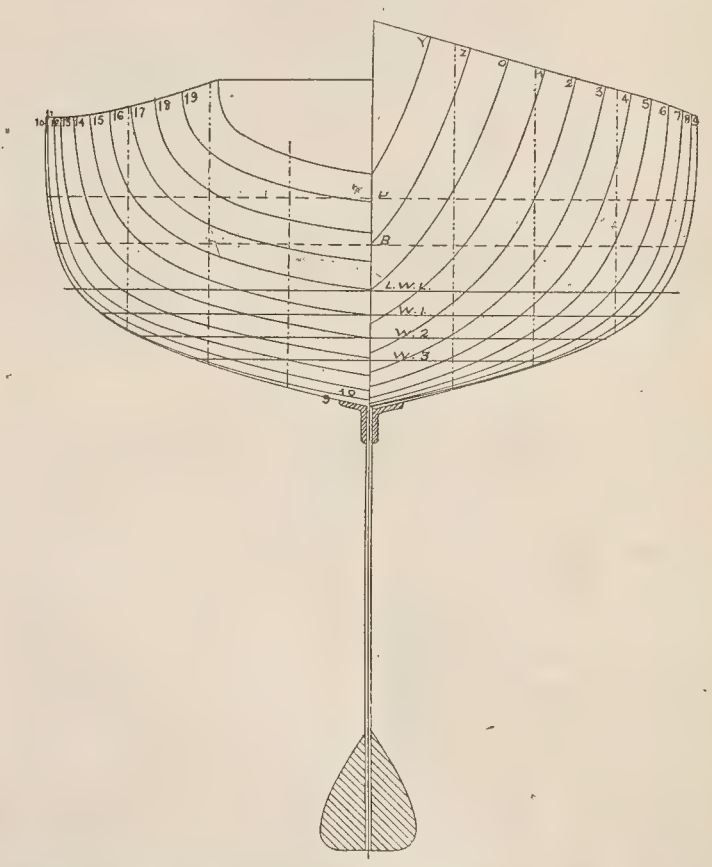
On some of the more important points, the proposed limitation of draft and the possible alteration of the present formula with a view of producing a better type of yacht, the Council has as yet reached no positive conclusions.

WENONAH-GUDRUDA.

IN spite of the large amount of information which it contains, the average yacht club book is not specially interesting or even valuable outside of a very limited field. The Imperial Y. C., of Germany, has for some years made its handsome year book of permanent value to yachtsmen, whether directly interested in the club or not, by the publication of yacht cruises and also of the designs of prominent yachts, both racing and cruising, each book containing three or four complete designs. It is through this medium that we are enabled to publish the lines of one of the earliest of the Herreshoff fin-keels, the first American yacht to make a notable record in British waters since the days of the old America. The first experimental bulb-fin, Dilemma, was designed by N. G. Herreshoff and built at the works at Bristol for his own use, being launched in October, 1891. The results of her successful trials being widely heralded, two orders were placed for similar yachts for the following season. The first order was from Henry Allan, of Glasgow, one of the younger members of the famous yachting family of the Clyde, who had raced the Watson lugger Elfin in the 2½-rating class in 1891. The new yacht, to which Mr. Allan gave the Indian name of Wenonah, was built to the same class, then in its prime on the Clyde. The other boat was ordered by H. Maitland Kersey, a young English yachtsman who had recently made his home in New York, and was intended for the then existing 25ft. racing length class on the Sound, of which Smuggler and Nameless were the first boats. El Chico, as Mr. Kersey named his boat, was practically a sister of Wenonah, with the exception of a slight difference in rig, she having no bowsprit, the jib being set with a club on the foot, this club swiveled to the stemhead and projecting forward of it for 2ft.

Wenonah's success was remarkable from the start, and in two seasons' racing she made a record of thirty-three prizes in forty-six starts, her total winnings being about $750. At the end of her second season she was purchased by His Royal Highness, Prince Henry of Prussia, brother to the Emperor, an enthusiastic yachtsman and owner of such crack yachts as the half-rater Niny, the forty-rater Irene, and later the cruising cutter L'Esperance. She was shipped

WENONAH.—2½-RATER.



Redrawn from lines in Year Book of the Imperial Yacht Club of Germany.

by steamer from Glasgow to Stettin, and in the seasons of 1894–5 she was raced with much success by her royal owner under the name of Gudruda; her advent doing much to stimulate the interest in the class in German waters and to promote the building of new yachts.

The lines of Gudruda, as here given, have been enlarged and redrawn from the small drawing in the year book of the Imperial Y. C. We presume that they are accurate and reliable, as in the cases of such noted yachts the lines are usually taken from the boat herself by an officer of the German navy. The dimensions of the yacht are as follows:

Length over all	37ft. 5in.
l.w.l.	25ft. 6in.
Overhang, bow	5ft.
stern	6ft. 11in.
Beam, extreme	7ft. 2in.
l.w.l	6ft. 6in.
Draft, extreme	6ft. 2in.
hull only	1ft. 3⅛in.
Freeboard, least	1ft. 10in.
Sheer, bow	1ft.
stern	5½in.
Fin plate	717lbs.
Bulb	1,500lbs.
Mast, from fore end, l.w.l.	6ft. 6in.
deck to upper hounds	25ft. 6in.
diameter, deck	5in.
greatest	5½in.
Bowsprit, outboard	2ft.
Boom	27ft.
diameter	4in.
Gaff	14ft. 5in.
diameter	3in.
Mainsail, area	434sq. ft.
Jib	142sq ft.
Total	576sq. ft.
Y. R. A. Official S. A., 1892	599sq. ft.

The construction and rigging of both Wenonah and El Chico is thoroughly original, the work of N. G. Herreshoff. The construction was more or less a matter of gradual evolution, the firm having built many steam yachts of increasing size year by year with steamed and bent frames of light scantling and double-skin planking. The rig, a most radical departure from the conventional details of both American and English yachts, was less of a gradual evolution than of a

speedy invention. The building of Gloriana in 1891 marked the return of the Herreshoffs to the field of sailing yachts, in which they had once been noted, after some years of practical retirement from it while engaged in steam yacht and torpedo boat work. The rigging of Gloriana was no less original than other of her prominent features, and was very far ahead, both in strength and lightness, of anything yet seen on either American or English cutters. The same characteristics were visible in the sloop rigs of the two smaller yachts.

Wenonah is built with a flat keel of oak about 12in. wide and 3in. thick, sprung to the proper sweep, the extreme fore end being formed of an oak knee where the curve is most abrupt. The frames are also of oak, sided 1in. and moulded 1⅛in., spaced between 9 and 10in. These frames after steaming are bent on solid moulds of the proper shape, each pair of timbers being secured to its mould with iron dogs and the moulds being then set up on the floor of the shop with the heels of the frames upward. The keel is then bent over the moulds, and the heels of the frames fastened. The wales are of white oak, in single lengths where the size of the yacht permits, with a heavy moulding worked on the upper outer edge, just under the plank sheer. After the wales are in place and the garboards, also of a single thickness, are fitted, the inner skin is laid fore and aft, of white cedar about ⅝in. thick; and over this is laid the outer skin of mahogany of about the same thickness. The planks are always narrow, not over 4 to 5in. The two skins are fastened to the oak frames by brass screws.

After the bottom is finished off the hull is lifted by overhead traveling cranes and turned over, the clamps, deck frame, etc., being put on. The clamp is of oak, 1⅝ by 1⅝in. The floor construction, to carry the bulb-fin, consists first of a series of oak cross floors, one on each frame, sided 1¾in. and about 3in. deep where they cross the keel. On top of these floors at each end of the hull are two pairs of keelsons. These are of oak, sided 1¾in. and 4in. deep amidships, tapering toward the ends. The after pair are parallel, 6in. apart. The forward pair converge until they meet at their fore ends. The mast step is a stout piece of plank bolted on top of the forward keelsons. For a distance of about 7ft. amidships there are no keelsons. The fin, which is of Tobin bronze ⅝in. thick, is fitted on its upper edge with two angles of the same metal, 3½×3½×½in., the two riveted through the fin. These angles fay against the bottom of the oak keel, to which they are fastened with ½in. Tobin bronze bolts, through floors and keelsons.

There is a deck beam to each frame, main beams 1×1¾in.,

other beams ⅜×1¾in. The deck is of white pine, narrow and ship lapped, the edges fastened with a U-shaped staple riveted below. The hull is well strengthened by knees, diagonal straps, etc., but the peculiar side trusses between bilge and deck introduced in 1895 in Mr. Allan's larger fin-keel, the 10-rater Dacotah, are not found in these earlier and smaller boats.

The accommodations are necessarily very limited, the extreme height from the top of the keel to the under side of the deck beam amidships is barely over 3ft. The "main saloon," with this head room, has for furnishing a shelf 16in. wide in each bilge, which, when cushioned, makes a sofa, though, as there is but 2ft. between it and the deck, one cannot sit upright. The deck is flush for the whole length, with a fore hatch about 2ft. 6in.×3ft., a companion 2ft.×2ft., and a watertight cockpit 2ft. 4in. wide and 3ft. 6in. long; it is 1ft. deep, with a bottom of ⅜in. plank, two thicknesses. There is room forward for a hammock cot, and there are shelves and pantries for food, a single paid hand being carried to look after the boat at all times. The finish of the hull is very attractive, with white pine and mahogany in contrast, and good joiner work in all parts. The transom, as shown in the plans, is merely a straight flat plank, strong, simple and unsightly; apart from this boxy end the yacht is very handsome on the water.

The 2½-rating class at the time of Wenonah's debut was rigged with the mongrel combination of gunter and leg-o'-mutton rig known as the lug; but Wenonah carried the ordinary gaff mainsail, with hoops on the mast. The mast was solid, 5in. in diameter at the deck and 5½in. from the middle to the hounds, above which was merely a conical point. The shrouds, of ⅜in. wire rope, ran to the hounds, where a shoulder was worked to carry them; the forestay of the same size rope, also going over the head, but higher up, just below the truck. The blocks were of brass, of the open shell pattern, with pin fast in sheave, and those on the mast were shackled into eyes which were riveted into flat brass plates, secured to the spars by brass wood screws. The jib halyard block hung from the masthead by a strap of wire rope, and the throat halyard block, instead of being hung from the ordinary fixed iron bracket, also hung from the hounds by a single part of ⅜in. wire rope, 3ft. 6in. long. At its lower end this pendant was spliced into an eye in a band made of 1½×$\frac{3}{32}$in. brass, which played freely on the mast, the upper throat block being also fast to a lower eye in the same band. In this way the throat halyard blocks might be set up block and block, leaving a minimum of halyard for stretching; and yet the gaff, swinging from the extreme top of the mast, was free to work without strain on the jaws.

The shrouds and forestay served to hold the top of the mast in place, but to provide for the forward buckle of the mast caused by the strain of the gaff the pendants were placed just above the jaws of the gaff when fully hoisted. Each went over the mast with an eye splice, and was prevented from slipping down by a bit of $\frac{3}{32}$in. sheet brass cut out and bent to form a hook, the flat part being fastened to the mast by wood screws. This same light piece of sheet brass was made to serve another purpose; two projecting ends were turned at right angles to form a pair of lugs, and to them was fastened with ⅛in. split pin the spreader for the shroud, of ½in. tubing 1ft. long. This same idea of fittings made from light sheet brass was carried out in other parts, and though ridiculously light to the eye accustomed to heavy forgings, they apparently served their purpose admirably. The boom gooseneck was of a peculiar pattern, partly shown in the drawings; the jaws of the gaff were made of sheet metal, as were many other small parts.

The mainsail of Wenonah had three battens, as shown, very flexible on the forward ends. The working jib was sheeted to a traveler forward of the mast. The lead of the main sheet was peculiar; there were two travelers, as shown in the picture of the yacht under sail; on the forward one, just abaft the rudderhead, was a single block to which the end of the sheet was made fast, leading up and through a block on the boom, thence down and through the first block and aft up to another block on the boom, thence down to the single block on the after traveler and forward to a cleat just abaft the well. In this way the sheet could travel back and forth across the deck without jamming against the rudderhead, as it must have done if led from the forward traveler.

The rudder was a single plate of ¼in. Tobin bronze, with a wooden tiller about 4ft. long, shipping in a socket on the brass ruddercap.

The owners of both Wenonah and El Chico have spoken in the highest terms of the good qualities of the boats—fast, weatherly and seaworthy in the extreme for their small size.

IN ALL WEATHERS.

A 15-footer* on Lake Ontario.

For two summers we had been looking forward to taking such a trip, and at last when it seemed within our grasp we could scarce realize that our expectations were now on the verge of fulfillment. Many a time since the August evening when last we waved a silent farewell toward its sandy beach and the green encircling hills of its little lake had we talked of Jordan and planned to pay another visit to its quiet beauties.

I talked of the bass and perch to be lured from its weed beds and old deserted cribs, or grew enthusiastic over starry lilies, music-making trees, glowing sunsets, and the pleasures of lying afloat in the little haven below the bridge, with the cool arms of night about us, the heavens above us spangled with stars such as no city ever sees, on all sides the clear water mirroring the stars above and the mystery of trees along its shores, and within us an inexpressible content that we were once in harmony with nature.

To this my *Fidus Achates* added his reminiscences of well-kept fruit farms, pretty farmhouses, quiet country roads, and luscious, freshly picked fruit, to be had for the asking.

Yet, despite our earnest efforts, one arrangement after another fell through, till I imagined "the stars in their courses" fought against us as they are said to have fought against Sisera.

Now, on the afternoon of Aug. 8 we were actually afloat on the waters of Lake Ontario, with our bow pointed S.½W. and three days' provisions in our lockers.

The crew, Vic by name, sat with his back against the coaming on one side and his feet against the coaming on the other and hummed snatches of a song, the refrain of which seemed to be, "No other pleasure can compare with drinking, drinking, drinking;" as he is a strict cold-water man I am at a loss to explain this, unless it is an example of hereditary depravity not entirely suppressed. It does me good to see how that boy enjoys his sailing, bubbling over with enthusiasm till his happy face is a veritable panacea for the blues and all other kindred ailments.

A light east wind was blowing, which kept us moving at the rate of about two knots. As we had left our moorings at about 1 P. M. with thirty-two miles of water before us, this did not promise well for reaching Jordan before morning. Still, hour after hour we slipped gently along, till the features of the northern shore and the spreading city became indistinct with haze and were gradually swallowed up by the thickening of the atmosphere. By 6 o'clock the wind had drawn almost dead ahead and remained as light as ever, while to the northwest the sky was darkening ominously and the sinking sun plunged out of sight behind the cloud veil with startling suddenness.

But later, as we lounged at ease sipping our coffee after a hearty supper, the sun's glowing disk appeared once more just above the horizon, flashing a fiery river across the lake to our quietly moving craft. When at last he disappeared again, the whole northwestern sky blazed into a lurid glow with the life blood of the dying day. The crimson glory tinted with the softest pink, the sails and deck and the spreading ripples from our bow were as crimson ribbons streaking the dark blue lake. Magnificent indeed was that blaze of color, and one watched breathlessly its deepening tints; but there was a menace in it that failed not to impress us and made me turn to Vic with a muttered comment as he watched with parted lips and earnest eyes.

Darkness fell rapidly, for the whole sky was clouded and no stars appeared to cheer the gloom. The night was warm, though not oppressive, for the clouds seemed to act as a blanket and the freshening southwest wind was as balmy as a tropical breeze. Soon lightning was flashing in the north and the southwest, following the heavy clouds that seemed to work west along the northern shore.

For hours we sailed, working in long tacks toward the southern shore, where twinkled the lights of Niagara and Port Dalhousie.

The lightning was constant, but thunder was seldom heard, so seldom indeed that we hoped to pass by Port Dalhousie's range lights before the storm could reach us.

Carefully we watched the western horizon when lit by the electric flashes, for we dared not be caught napping with all our canvas spread, and yet it seemed wise to carry on to the very last minute, so as to reach a haven as soon as possible. Suddenly a roll of thunder seemed to vibrate through the boat and then a few drops of rain splashed down upon us. The oilskins were quickly got out and donned, but after a few minutes the shower ceased and again we hoped to miss the storm.

Vic, peering out to windward, saw a lifting of the clouds and said cheerfully, "No more rain." While he spoke I swept the western horizon and saw there well abeam the grim black clouds stooping down and sweeping the water with misty trailing vapor wreaths.

"Do you see that?" I said. "There's the rain!" "Down with the mainsail!"

He jumped for the halyards, already cleared, and in a trice the mainsail was dropped, leaving us jogging slowly along under mizzen and jib, watching carefully the sea and sky to anticipate the next move of the enemy.

A coil of halyard had gone aloft when the mainsail came down, and as I watched the crew getting it clear my eyes traveled to the main truck. A thrill ran through me as I looked, for the mast head was glowing with lambent light, appearing as the little vessel rocked like a finger of fire inscribing mystic symbols on the dark clouds above.

Look! quick! St. Elmo's fire! A corposant!" I cried, and Vic gazed in wonder at the uncommon sight.

'Tis a good omen, the sailors say, and yet it is an eerie sight to see that intangible flame lapping to the masthead, dimming to the brighter glare of the lightning, and glowing out again more clearly when the darkness of sea and sky again reigns unchallenged.

Now there came a lull in the wind. "Ah!" I said, "this means mischief. Down with the jib." The crew judged there was no time to lose, and indeed the sail was hardly down ere the squall was upon us. Then by the glare of a lightning jag I saw Vic's yellow-clad figure drop flat on the struggling folds of the jib as he lashed it to the bowsprit, the white and yellow silhouetted on a background of black sky and greenish water lashed to spume by wind and rain.

Incessantly the lightning flashed, striking the eyeballs with a shock that hurt; while the crash of thunder, the hiss and beat of the rain, and the rush of wind through the rigging and around the straining and fluttering mizzen, made a pandemonium beyond description.

The fury of the wind drove us astern at such a rate that the most careful attention had to be given to keep the helm amidships, and prevent the boat swinging broadside to the rising sea.

And what a sight it was as we crouched in the cockpit to gaze at the seething water, scourged by the flail of the wind into hissing ridges, from whose flanks the driving rain flashed in a snowy veil.

In the heart of the storm we drove along, shut out by its sweeping mist-garments from all sight of friendly lights and indications of other existences than our own. At such a time one is impressed with a strange sense of loneliness, of utter aloofness from all humanity that would become oppressive were it not tempered by a feeling of pride in the proved capabilities of the boat beneath you, and a knowledge that one's crew could be relied upon to the utmost in steadiness and skill.

For five minutes the squall did its worst, and lightened up only to return a few minutes longer with all its pristine fury.

As suddenly as it came the furious west wind ceased, and once again our old friend from the southwest resumed his sway.

In the southeast over Niagara the storm was now apparently raging, for zigzag streaks were there flashing down in sheafs and streams so constantly that the eyes ached with the brilliancy.

Overhead the clouds were rolling away, and ere long the Pleiades were beaming on us from the east, and over in the west the great Northern Cross was bending to its setting, shining on us like an omen of safety as it sank.

Once again we picked up the twin lights of Dalhousie and the brighter glare of Niagara, and soon were plunging shoreward again with all our canvas set. The wind had left a moderate sea, and a pretty sight it was to watch the occasional spray clouds flying over the forward deck change to crimson and green as they dashed across the path of the rays from the triangular skiff lantern lashed to the mast.

I looked at my watch. It was twenty minutes to 4, and already the stars were dimming and a brightness creeping into the eastern sky. The dawn was so near that nothing was to be gained by running into Port Dalhousie; so after working in well toward the land we went about, and passing it to port stood along shore directly for Jordan, which we made without further incident at 8 o'clock.

An early cup of coffee had banished the sleep from my eyes; so after landing some wet stuff to dry, I got out the fishing tackle and tempted a few sunfish and bass to take my bait. Vic tried also for a while, but soon tired of it, and lay down for a sleep.

Jordan proved to be all we remembered and anticipated, and more pleasant memories will now be added to our store. Ask Vic if he will ever forget the swim in the clear, cool, deep water of the outlet; the dinner eaten lying in the grateful shade of the old dock and elevator, among whose piles and cribs the water trickled and gurgled; the big-hearted fruit farmer and his acres of plums and large thimble berries in which we reveled, or the well-earned repose that night under the cockpit tent, with a lulling wind singing incessantly through the trees.

We met there too a regular "old man of the sea," who proved a veritable incubus; for he seemed to be afflicted with a monomania regarding a Mackinaw boat some Toronto men had offered to sell him. Twenty times if once he approached me in regard to the boat, his inquiries generally taking some such form as these:

"You don't know Lang?"

"No."

"Likely you'd know the boat if you heard the name."

"Probably I would."

"Mackenaws are good fishing boats, ain't they?"

"Yes. They use nothing else on the Upper Lakes."

"Right smart sailors, I guess?"

"Yes, they sail very well, though not so good as a sloop to windward."

"Lang lives on Churchill avenue."

"Yes?"

"He says she's rented to a man down at the Thousand Islands and comes to Toronto every two weeks."

"Oh!"

"You don't know Lang?"

"No."

"What boat comes up from the Thousand Islands every two weeks?"

"Don't know."

Here follows a pause of five minutes as I move further along to drop my line in a fresh place.

Presently he sidles up and begins again.

"Pretty good fishing boat, a Mackinaw?"

A grunt (from me).

"Not so good as a sloop to windward, though?"

Grunt.

"You know most of the yachts at Toronto, I guess."

"Yes."

"I wisht you knew her. Lang says he rented her to a man and she comes up to Toronto from the Thousand Islands every two weeks."

Silence again.

"You don't know Lang?"

"No," explosively,

"They carry a lot of canvas, I guess?"

Another grunt.

"Lang says he will let me have her for $40."

"Oh, d—— Lang!"

Then he subsides into injured silence for some minutes while I pulled out a fat sunfish and put on a new worm. Not for long does he remain quiet and begins again:

"I wisht I knew her name, then likely you'd know her."

No answer.

"Lang says she's 28ft. on the keel. Do you think it likely she'd hold a couple o' mile o' net?"

"Look here, my friend," I said, "if you want to know anything about Mackinaws, you go and talk to my friend over there. He's just come back from Parry Sound and knows all about them."

He stumped over to Vic with his curious wooden-legged walk, and I watched with great interest the cheerful alacrity with which Vic imparted all he knew about Mackinaws gradually fade into saturnine impassiveness; then I knew misery had company, and was happy. There was no escaping him till we went for a swim, and there he did not follow us. After we came out I said to Vic, "We'd better clear out of this and go over to the elevator on the Lake Shore unless we want to be bored to death with this old nuisance." We went and stayed at the old storehouse till an approaching thunderstorm drove us to shelter again in the creek.

Next morning I crawled out of the tent and stood on the counter with night robes fluttering in the morning breeze, while I prospected on the weather. There that inspired idiot stood on the bridge and in response to my nod withdrew his pipe from his mouth and waved it in the direction of the lake. "There's a boat standing in here," he said; "she looks like a Mackinaw. Likely it's Lang come over from Toronto. I'd like to have you look at that boat."

In despair I plunged below again and got into my clothes, refusing to indulge in further conversation.

All night long the wind had been very strong, but as morning advanced it quieted down so much that we deemed a start both safe and advisable. At 10 o'clock A. M. we hoisted our jib, cast off our bowline from the bridge and swung down stream lakeward, getting in our anchor, which had been let go astern, as we passed it. I waved a good-by to the Jordanites on the bridge, and the last words I heard from land were: "If Lang's Mackinaw comes from the Thousand Islands, I wisht you'd take a look at her." I mentally consigned Lang, his Mackinaw and the "old man of the sea" to everlasting perdition, but remained outwardly calm. As we cleared the sunken cribs projecting the mouth of the creek we hoisted the reefed mainsail, running awhile under it and a whole jib with a fresh and quartering breeze.

Gradually the wind lightened till it seemed advisable to shake out our reef. When that was done the mizzen was next spread to the breeze; then a balloon jib followed.

For some time the wind continued to drop, and then gradually freshened again, at the same time drawing more into the south, till at 1 o'clock it was almost dead aft, enabling us to set the spinaker.

Now indeed we began to have hopes of making a record run, for the sheets were tugging harder and harder, a stronger note was in the voice of the wind, and an increasing swirl and swish made music to the ear as the rising waves passed underneath. Vic laughed happily, and a curious exhilaration went tingling through my veins.

The horizon was rather hazy, but soon we picked up the tall "Power House" chimney, belching out great clouds of smoke, and the white tower of the Island lighthouse clear and distinct against the smoky background of the city.

*The little yacht Lynette was illustrated in the Forest and Stream of April 6, 1895.

Still faster and faster we flew, tearing through the wave crests with a rush that sent them driving off in a foamy curl that rose clear above the leeward deck and yet touched it not. Then when we were caught on the advancing front of a swell the wave motion seemed to carry us forward with such a breathless rush that the spinaker would momentarily fall into a bag and the water boil under the counter with a note of distant muffled thunder. The exhilaration of the rushing, swooping motion and the sparkling life of the lake acted on us like strong wine, and we laughed and shouted and sang like very schoolboys let loose on an unexpected holiday.

As we passed the lighthouse and the holiday makers on the point the waves and wind were still increasing, and I said to Vic: "We can't begin to carry this canvas on the wind; we'll go down the bay with a flowing main sheet or I'm no prophet."

He glanced at the canvas, then over the stern to windward and said: "We'll be lucky to reach our mooring without dropping it altogether or else reefing. But what of that? our record's to the Western gap."

The Queen's wharf was made at 3:20 P. M., which meant a run of thirty miles in five hours and twenty minutes.

As the breakwater bore abeam we clipped the wings of our flying sea horse by dropping the spinaker, and then waiting for a smooth went about, not daring to jibe with such a strong wind and in the midst of the pyramidal jump of water caused by the back wash from the piers. The wind from the lake had rolled back the smoke from the city, and old Toronto in the fresh, clear air, bright with her waving trees and holiday bunting, looked indeed the Queen City of the Lake. Many white wings dotted the expanse of the bay, but no craft seemed able to carry all lower canvas, and single and double reefs seemed in general favor. As for us, we were glad to run down the bay with main sheet well eased off, then lower mainsail, and run into our boat house slip under mizzen and jib. After canvas had been stowed and dunnage landed, I turned to Vic and said: "Are you satisfied with the run?"

He replied: "It was the sail of a lifetime," and I agreed with him.

J. EDW. MAYBEE.

Larchmont Y. C.

A SPECIAL meeting of the Larchmont Y. C. was held on Oct. 28 at Delmonico's, with Com. Gillig in the chair, the object being to adopt the proposed amendments to the racing rules. All of the proposals were adopted, though several changes of detail were made in the course of the meeting. The rules in use for the past two seasons have been changed in many ways that experience has shown desirable, and the proposed amendments covered a large number of details. The classification has been revised, the limits having already appeared in the FOREST AND STREAM. This classification is practically uniform with the New York Y. C. and the Yacht Racing Union. The 15ft. class has been dropped, the smallest being the 20ft., and all of the special classes, the 34ft., 30ft., etc., have been dropped, the boats henceforth taking their places according to measurement in the regular classes. This is a good change. Whatever the special classes may have done for racing in the past few seasons, it is apparent that their usefulness has departed, that much more is to be gained by strengthening and building up a number of regular classes. The plan of designating each class by a letter of the commercial code has been adopted, but with it the old and confusing system of arbitrary names for the classes has been retained. The practical result of this system is apparent in reading over the rules; the statement that a yacht in Class G shall do one thing and a yacht in Class Q shall do another conveys of itself no information whatever unless a man has memorized the whole list or has it in his hand. It would have been quite as direct, concise and simple to use the terms 70ft. class, 30ft. class, etc. In connection with the classification it is provided that the regatta committee, with the approval of the commodore, may establish special classes for any regatta.

The limitation of draft is identical with that previously adopted by the New York Y. C.; in fact, though the proposed limitation was first actually adopted by the New York Y. C., the idea originated within the Larchmont Y. C., and that club is entitled to all of the credit for it. The following proviso, however, was added to avoid the blunder made in passing the rule in the New York Y. C.:

"But this limit shall not apply to any yachts in existence at the time of the passage of these amendments when racing in the class in which she was classified prior to this time."

"This exception, however, shall not be so construed as to permit a vessel launched prior to Oct. 22, 1896, to increase her draft beyond the limit allowed for her class.

As already noted, the rule as passed by the New York Y. C. is so worded as to allow the deepening to an unlimited extent of an existing yacht; for instance, it would be possible, so far as the rule goes, to rebuild Emerald, making her a bulb-fin of any extreme draft.

The allowance for rig and the measurement rules are both unchanged; except for the proviso that in classes P, Q, S, Y and V, which we find by reference to page 4, are the 25 and 20ft. classes of sloops and the three catboat classes, over 25ft., 25ft. and 20ft., the measurement shall be taken with a weight on board equal to 150lbs. for each man allowed for crew. Unfortunately this excellent regulation is not extended to cover the larger class and all rigs, as might easily be done at the present time, but is left to the future, when it will be infinitely more difficult. Provision is now made for the deposit of the lines of winning yachts with the club, with the privilege of making models therefrom for the club's collection. The privilege of copying such lines or models is accorded to "the United States Naval Constructor."

The allowance table stands as it was, but three very important stipulations have been added: one that no new yacht launched after Nov. 1, 1896, shall be entitled to time allowance in her class, except the largest and unlimited class of each rig; another that in the case of old yachts going up a class they shall assume the mean racing length of the class; and a third designed to keep existing yachts in their present classes. The first proposition is an excellent one, long advocated by the FOREST AND STREAM in connection with the one-gun start; all times taken from the gun and the first yacht over the line at the finish being the winner. This will do much to strengthen the classes and to improve the quality of the racing, as it will effectually bar the building of yachts well under the class limit for the sake of the allowance. The second proviso is worded as follows: "Any yacht alone in her class may sail in the class next above, but in such case such yacht shall assume and be entered as of the mean racing length specified for the class in which she so enters; but this shall not be so construed as to permit a sloop, cutter or yawl to enter in a schooner class." This new section is merely in accord with the idea of class racing without time allowance; it puts a heavier penalty than ever before imposed on a smaller yacht which goes up into a larger class.

It is a question whether the rule might not well be made even stronger, so as to prevent entirely a smaller yacht from going above her own class and possibly spoiling some very good racing in a larger one. In the past, with an infinite number of classes between the numerous clubs and comparatively few yachts in any one class, it was desirable to encourage racing by allowing a yacht with no competitor in her own class to go into a larger one. In one way no harm was done, as every yacht in the larger class gave or took time as well as the outsider. It is an open fact that this privilege of sailing in one class or another at will was not infrequently abused in one of several ways. The underlying assumption on which all the present changes of rules are based is that with fewer and more sharply defined classes and no time allowance, with a thorough system of starting, timing, signaling, etc., and with a large number of races under uniform rules, there will be enough entries in certain favorite classes in almost every race to provide good sport within these classes. This being the case, it is well to put a stop to the practice of going up a class, by which one outside yacht, with her allowance, may break up the racing of half a dozen boats of the same measurement in the larger class. It of course follows that with the withdrawal of the old privilege there must be a provision for a "sail-over" prize, as a matter of justice to the owner who comes to the line ready to start and has no competitor; but whatever may be urged against sail-over prizes as meaning nothing, the use of them is preferable to the alternative of disturbing a number of yachts properly in a class for the sake of one that is not in it.

A new addition to the same rule is as follows: Any yacht that increases her measurements for the purpose of sailing in a class above that in which she would sail according to the last official measurement taken prior to Nov. 1, 1896, shall not be entitled to any time allowance from other yachts in that class. In practice this, for instance, would prevent one of the special 30ft. class going into the 36ft. class, as it stands to-day, with only old or semi-cruising boats, and destroying all racing in the class. It serves, in the transition from old rules to new, to keep existing yachts in the classes which they naturally fit, even though exceeding, through intention or otherwise, the exact limit of the class.

In the rule relating to entries a very important change was made, as an amendment to the original proposal: The racing measurement of a yacht must be filed with the regatta committee before 10 o'clock on morning of race, and not ten days thereafter, as was at first proposed. This rule, if rigidly lived up to, as it should and probably will be by the Larchmont officials, will work hardship now and then in individual cases; but it is a necessary and an excellent one.

The members in charge of the new amendments are not landsmen, but practical yachtsmen with experience both in sailing and in the management of regattas; and we do not understand why they have used the term "walk-over" in preference to "sail-over," as follows: "At least two yachts must start in any one class to entitle a yacht to a prize of full value. Should a yacht be obliged to sail alone in her class, and shall go over the course of her class, she shall be entitled to a prize of one-half the value of the regular prize, and upon same shall be inscribed 'Walk-over Prize.'" The obvious intent of this rule is excellent in connection with the penalty imposed on yachts going up into a larger class.

As to boats, it is provided that every yacht in the 60ft. class and those above it shall carry a boat on deck.

The new courses of the club are described at length in the rules, as heretofore. After several years of trial the arrangements for signaling the courses, starting, stopping a race at any time, etc., have been brought to a very satisfactory stage of perfection by the club, and but few changes have been found necessary.

One small detail which has been improved is the locating of the number and letter above the upper reef points and midway between leech and luff. In the matter of crew, there are no restrictions save as to number in the classes from J upward, but the smaller classes must be steered and manned by amateurs; yachts in classes K, L, M and N being allowed to carry their regular crews, and yachts in classes P, Q, S, T and V being allowed one professional. The total number of crew is limited in each class, some changes being made from the old limit allowing more men. On yachts in classes N, P, Q, S, T and V not more than one lady may be carried.

One of the most important changes is in the manner of starting: "All starts for each class shall be what is known as one-gun starts." Arrangements are made for starting each class separately with a five minute interval by the successive display of the code signals; for instance, the letter N indicates the start for the 30ft. class, and also the preparatory for the 36ft. class, which starts five minutes later on the display of the letter M; also a preparatory for the 43ft. class.

In the racing rules of the road (Rule XXIV.), Sec. 7 has been amended by the following addition: "In order to prove beyond question that an overlap has been established the owner or representative of the overtaking yacht shall hail the overtaken yacht, stating that he has an overlap, and that he shall maintain his rights." Most yachtsmen will be able to recall instances within their personal experience in which the owner or representative of an overtaking yacht has imparted in terms more forcible than polite the information that he has an overlap and intends to maintain his rights, but we know of no instance on record in which such an assertion, however emphatic, has been accepted as proving beyond question that an overlap had been established. The new rule introduced a year ago to govern maneuvering at the start is retained, though open to very serious objection, and not yet accepted by any other club.

The rules as to protest, disqualification, etc., remain unchanged, but there is one rule which may work serious injustice, as now worded: "A yacht which shall be disqualified twice in one season shall be debarred from sailing in club races for the remainder of the season." There is in this wording no recognition of the fact that a yacht may innocently disqualify herself in a way that does no injury to any other yacht, as by the technical fouling of a mark in touching the flag on it; or she may even do so by actual contact with another yacht through circumstances for which she is not morally responsible. It is certainly not the intent of the rule that two such mishaps early in the season should bar a yacht for the remainder of the year. If, as would appear, the intent of the rule is to cover only such cases as disqualification on protest, or by the regatta committee for cause, some change of the wording is necessary.

There are two points in the rules which, in our opinion, are open to serious criticism: the failure to discriminate between the keel and centerboard types in fixing the limits of draft, and the failure to measure with crew aboard in the larger classes. Except in these points—and unfortunately they are important ones, in which a mistake now cannot be easily remedied next year or the year after—the changes are desirable and likely to prove of great benefit to yacht racing, both within the Larchmont Y. C. and throughout the Sound.

Society of Naval Architects and Marine Engineers.

THE fourth general meeting of the Society of Naval Architects and Marine Engineers will take place in New York city at 10 A. M. Thursday, Nov. 12, 1896. Through the courtesy of the president and managers of the American Society of Mechanical Engineers, the meetings will be held in the auditorium of No. 12 West Thirty-first street, the sessions continuing through Thursday and Friday, Nov. 12 and 13.

There will be a banquet at Delmonico's at 7 P. M., Friday, Nov. 13, to which members and their guests are cordially invited. Tickets, exclusive of wine, will be $5 each, and they can be obtained, after Nov. 10, by applying to the secretary.

In order that suitable arrangements may be made, the executive committee requests that members will notify the secretary as early as practicable of their intentions as to the banquet, and also as to the probability of their attending the meetings of the Society.

Members intending to propose candidates for membership are requested to notify the secretary in order that the necessary blank forms of application may be forwarded and properly filled out.

The papers to be read are as follows:

THURSDAY, NOV. 12.

1. Test of an Experimental Turret of the U. S. Battle-ship Massachusetts, by Com. W. T. Sampson, U. S. N., Chief of Bureau of Ordinance, Navy Department, Washington, D. C.
2. Steel Canal Boats, by Lewis Nixon, Mgr. Crescent Shipyard, Elizabeth, N. J.
3. Trial Performance of the Grand Duchess, by S. N. Smith, Mgr. Newport News Ship-Building and Dry Dock, Co., Newport News, Va.
4. Naval Practice in Ship Rivets and Riveting, by Naval Constructor J. H. Linnard, U. S. N.
5. American Fire-Boats, by H. DeB. Parsons, Marine Engineer.
6. Corn-Pith Cellulose, by H. W. Cramp, Vice-Pres. Wm. Cramp & Sons, Philadelphia, Pa.

FRIDAY, NOV. 13.

7. The New Battle-Ships, by Chief Constructor Philip Hichborn, U. S. Navy.
8. Speed Trials of a Screw-Propelled Ferryboat, by F. L. Du Bosque, Engineer Floating Equipment, Pennsylvania Railroad.
9. Hydraulic Sheers for Lifting One Hundred and Twenty-five Tons, by Frank B. King, Marine Engineer and Naval Architect.
10. A Method of Calculating the Stability of Ships, adapted to the use of Standard Curves of Stability, by Hugo Hammar, Naval Architect.
11. Stability of a Ship in Damaged Condition, by James Swan, Massachusetts Institute of Technology.
12. Damaged Conditions as Affecting the Stability and Fighting Efficiency of Battle-Ships, by Assistant Naval Constructor T. F. Ruhm, U. S. Navy.
13. Screw Propellers, by Prof. Geo. R. McDermott, Cornell University, Ithaca, N. Y.

A. C. A. Executive Committee.

THE annual meeting of the executive committee of the American Canoe Association will be held on Friday, Nov. 13, in Toronto.

Rifle Range and Gallery.

Calumet Heights Riflemen.

CHICAGO, Ill., Oct. 25.—The scores made by the members of the Calumet Heights Gun Club in the rifle contests held on Oct. 18 and to-day are given below:

Class A, 200yds., Standard target, off-hand:

	Oct. 18.		Oct. 25.	
Davis	4333534424	35+2=37	5343354344	38+2=40
Harlan	4442342445	=36	4454533344	=38
Norcom	4000234323	22+2=24	.....	
Hodson	2222333333	=26	.....	
Paterson	4540345334	33+2=35	4543443324	36+2=38

Class B, four ties; 100yds., rest, Creedmoor target:

Mrs C W Carson	4545451544	=44	4444444554	=42
Mrs Marshall	5444344345	40+2=42	3342334444	34+2=36
Mrs R B Carson	5443445454	=41	.....	
Miss Ervin	5444443445	=41	3544444454	=42

In Class A Davis was the winner on both dates. Mrs. C. W. Carson was also the winner in her class on both occasions.

PATTY.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

Nov. 7.—HACKENSACK, N. J.—Cup contest, under the auspices of the Bergen County Gun Club. C. O. Gardiner, Sec'y.

Dec. 1-3.—TRENTON, N. J.—Proposed contest for live-bird championship; 100 live birds per man, $100 entry. Under the management of Charles Zwirlein.

1897.

Jan. 4-5.—PRESCOTT, Arizona.—Fourth annual tournament of the Arizona State Sportsmen's Association, under the auspices of the Prescott Gun Club. Roy Hill, Sec'y.

January.—SAN ANTONIO, Tex.—Second midwinter tournament, under the management of Oscar Guessaz, etc.

March 23-25.—NEW YORK CITY.—The Interstate Association's fifth annual Grand American Handicap at live birds.

April 15-17.—SAN ANTONIO, Tex.—Tournament of the San Antonio Gun Club. Open to amateurs only. Willard T. Simpson, Chairman Ex. Com.

May 11-14.—OIL CITY, Pa.—Seventh annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. Targets and live birds. Black powder barred. Special event: 25 live birds per man, $25, $1,000 guaranteed. Send entries to H. C. Reeser, Sec'y, Oil City, Pa.

June (third week).—CLEVELAND, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

DRIVERS AND TWISTERS.

H. G. Wheeler, one of the best target and live-bird shooters in Massachusetts (and that is saying a good deal, as there are some fast ones in that State), stopped off for a few days last week on his way South for the winter. Mr. Wheeler's health is not of the best, and the changeable climate of our Northern winter is too severe for him to run any risk by stopping among us for the cold season. He is an enthusiastic wheelman as well as shooter; he rode from Marlboro to New York on his bicycle, and expects to make a great part of his journey South by means of the same method of locomotion. The form he displayed at the Jersey traps during the Elizabeth tournament showed us that "Gil" has not forgotten how to break targets since we last saw him face the traps in the Hazard tournament at Cincinnati last May.

On the afternoon of Election Day the Independent Gun Club, of Plainfield, N. J., and the Dunellen, N. J., Gun Club will shoot the fourth match of a series of five arranged between these two clubs. As matters stand at present, the Plainfield club has won two of the three already decided. On the same date Henry Weidmeyer and Valentine Swody will shoot a match at 50 targets for $25 a side.

The Limited Gun Club, of Indianapolis, Ind., is considering the question of holding a tournament at sparrows during the week preceeding the annual shoot at San Antonio, Texas. The idea is to give the Eastern shooters a chance to stop off at Indianapolis on their way South and try their hands at the Indianapolis specialties—smoothly run tournaments and a sparrow shoot.

B. W. Claridge, of Baltimore, holder of the Du Pont championship trophy, has named Nov. 10 as the date for his match with George Roll, of Blue Island, Ill., the challenger for the trophy. The conditions are 50 live birds per man, the shoot to take place on the grounds of the Baltimore Shooting Association. It will be remembered that after the decision of the Claridge-Malone match on Oct. 6 J. L. Winston challenged the winner of the Claridge-Roll match, posting a forfeit to bind the challenge.

As Election Day comes on Tuesday, FOREST AND STREAM is put to press on Monday instead of Tuesday, and a number of scores are held over in consequence. Among them is the score of the McIlhany-Calhoun match for the live-bird championship of Kansas, which was won by McIlhany by a score of 46 to 41.

Nov. 2. EDWARD BANKS.

On Long Island.

HELL GATE GUN CLUB.

Oct. 27.—The monthly shoot of the Hell Gate Gun Club, held to-day at Dexter Park, was well attended, 29 members taking part in the club event at 25 live birds per man, club handicap rise. Gus Nowak and John Schlicht were the only two to score straight, while Ed Paynter and Eugene Doeinck won second place alone on 9 out of 10. Dr. F. M. Bauer shot along with the members of the club as their guest, scoring 8 out of 10. Each man's score in detail is given below:

Gus Nowak	2221222212—10	H W Voss	1001002111— 6
John Schlicht	2112111221—10	Emil Petersen	2210202010— 6
Ed Paynter	1112221220— 9	Chas Schaefer	1012110010— 6
Eugene Doeinck	2121102122— 9	Emil Metz	2202100202— 6
John H Voss	1•212211122— 8	Adam Knodel	1201200010— 5
Frostel	1211111020— 8	Henry Foster	1210000202— 5
Dr Bauer	0120121222— 8	John Fairboter	0010222001— 5
L C Muench	0110211112— 8	Louis Stetzle	0010101010— 4

Jacob Himmelsbach	2011020110— 6	Conrad Weber	0200010100— 3
August Schmitt	0202020222— 6	Chas Lang	0002200001— 3

EMERALD GUN CLUB TOURNAMENT.

Oct. 29.—The tournament of the Emerald Gun Club was held at Dexter Park to-day. Fifteen shooters participated, among them some of the best shots in this vicinity. Wheeler, by some excellent shooting, finished ahead, closely followed by Van Dyke and Remsen. Event No. 8 was a match at 50 targets, expert rules, between Winston and Wheeler, which the former won by one bird after a close race. The scores:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	20	15	25	10	15	20	20	50	10	10
Remsen	20	14	24	..	15	17	20	..	10	..
Wheeler	20	15	24	10	14	20	18	44	..	..

Elliott Challenges Riley.

THE following letter has been received from J. A. R. Elliott:

KANSAS CITY, Mo., Oct. 30.—*Editor Forest and Stream:* I herewith inclose copy of challenge issued under this date to J. E. Riley, holder of the Kansas City Star Championship Wingshot Cup. By common consent, it was agreed that any Kansas City man winning the cup at the Missouri State shoot should not be harassed by challenges from local people until ample time and opportunity had been accorded the numerous championship aspirants to challenge the cup holder. About six months have elapsed since Mr. Riley has held the trophy, and no challenge having been issued him, I consider that it is high time the trophy should be called in competition, and accordingly have issued the subjoined challenge to Mr. Riley and await his pleasure as to time and place of contest. Respectfully, J. A. R. ELLIOTT.

James Whitfield, Esq., Sporting Editor Kansas City Star, Kansas City, Mo.

DEAR SIR: I herewith inclose you forfeit, and challenge Mr. J. E. Riley, holder of the Live-Bird Wingshot Championship of America, subject to the conditions and rules governing same. Respectfully yours, J. A. R. ELLIOTT.

Lake Side Rod and Gun Club.

BURLINGTON, Vt., Oct. 21.—Below are the scores made at the monthly shoot of the Lake Side Rod and Gun Club. The weather was unfavorable for good shooting, the wind blowing strongly across the traps all the time. The attendance of members was small. Scores:

No. 1, 25 targets, unknown angles: E. A. Worthen 19, H. E. Spear 19, Dr. H. E. Colvin 17, W. S. Stone 12.

No. 2, same conditions: Dr. H. E. Colvin 17, W. L. Stone 10.

No. 3, same again: Dr. Colvin 14, W. L. Stone 12. VERMONTER.

Programmes and Tournaments.

PITTSBURG, Pa., Oct. 24.—*Editor Forest and Stream:* I have read, re-read and read again the article "Programmes and Tournaments" in current issue of FOREST AND STREAM, and I am now cogitating as to why the salient features so clearly stated in same, which are necessary to the success and welfare of trap-shooting tournaments, have not been presented to the shooting public a long time ago. The article in question so thoroughly covers the ground that it would not be amiss for every gun club that contemplates giving a tournament to have a copy of your issue of Oct. 24 before their members, so that they may carefully digest the "meat" contained therein.

The concluding paragraph, "No tournament should be given by any club with the idea of filling the club's coffers with the proceeds of that shoot. If you add money, raise it at home; don't go abroad for it. If you don't add any money, don't charge 2 cents a target, or you will lay yourselves open to the charge of being after the boodle," meets with my earnest and hearty approval. It is conceded that trap-shooting is among the very few clean sports, and that gun clubs are not primarily organized for the purpose of making money; therefore the annual dues, membership fees, and residue derived from practice contests should serve to meet the running expenses of the club and keep the treasury intact. This being the case, when a tournament is given, the meeting of friends, the social features connected therewith, the friendly strife for supremacy at the traps, and the knowledge that the club's guests have been fairly dealt with and honestly treated, should be sufficient reward, especially if the club's treasury is not called upon to make up a deficiency.

The business people of the city in which a tournament is given are the people who derive pecuniary gain from same, and if added money is to be raised by subscription it is well to solicit at home donations of money or merchandise from those who will directly profit by the holding of the tournament. It is a recognized fact that for advertising to bring in any return it must be the result of wisely directed effort, and a patronage of such mediums as will place the advertisers' wares directly before the consumer at a cost which is recognized as fair and just in the business world. In this connection the method employed by some gun clubs in raising added money might be touched on lightly. With some organizations their first thought when a tournament is spoken of is that the sporting goods manufacturers should contribute and cover almost the entire expense of the shoot. They do not ask for the money direct, but for its equivalent in the way of guns, shells, powder, or, as is generally the case, from $10 to $50 per page for an ad. in the programme, which in many cases does not circulate outside of their own particular locality, and as an advertising medium is money thrown away. The manufacturer, no doubt, feels like refusing many of these appeals, but recognizes that his position is a delicate one, and that his refusal might be construed as a personal affront to the members of the club, so he, for business reasons, pays the exacted tribute. This method or system of raising money should be discountenanced by all gun clubs. They ought not to ask or levy tribute on the manufacturer as a club or organization when they would not have the "nerve" to do it as an individual. The refusal of a manufacturer to contribute should be accepted in a businesslike way. I have received dozens and dozens of letters from clubs asking how they shall proceed in order to secure a donation, advertisement, etc., from the manufacturers, and I am thus in a position to know to what an extent this is carried on.

It must be admitted that the adding of large sums of money attracts the shooters from far and near, and that it is impossible for the great majority of clubs to offer these large purses without resorting to the means just outlined. How are we going to have large tournaments then, and not raise money in this manner? Personally I am of the opinion that tournaments where large sums of money are added should be left entirely to the sporting goods manufacturers, who will, no doubt, derive great benefit from the advertisement gained through giving same. It is well known to those who attend tournaments that it is the smaller shoots, where from $200 to $500 is added, that the greatest amount of pleasure, social courtesies and good fellowship is to be derived; so I am in favor of gun clubs holding tournaments of this kind.

I am not in favor of adding merchandise prizes, and in my opinion they should be entirely eliminated from a programme. By this I do not mean that medals and cups should be done away with, for I believe they add to a programme and attract shooters, but it is the "plunder" prizes (as the boys call them) that should be left out. In almost every case merchandise prizes prove a bone of contention as to the method of disposal of the ties for same after the event is shot. Ties are very rarely shot off, and of the many tournaments I have attended where merchandise prizes have been offered I can recall but few instances where the prizes have been disposed of according to the programme. The ties have been eventually settled by some one of the contestants purchasing the interests of the others, or by deciding them by chance or lottery, such as placing the names in a hat and drawing for same. This is radically wrong and seldom gives satisfaction to the shooters; although they do not say much about it at the time, they afterward give vent to their dissatisfaction in no uncertain manner.

The stand you have taken in regard to charging 3 cents for targets when there is added money, and less than 2 cents when there is no added money, should meet with the approval of all gun clubs that give tournaments for sport and good fellowship, and not for the ultimate end of making money. Where there is no added money 1½ cents per target will put more money in a club's treasury than where 3 cents per target is charged and $100 per day, the usual sum, is added. This may seem strange, but it can be easily demonstrated by a few minutes' figuring on the part of interested parties. For example: suppose a club adds $100 and traps 5,000 targets at 3 cents each, or $30 per 1,000, thus receiving $150 for targets, this will leave a balance of $50 after added money is deducted. Now suppose this same club without adding any money had trapped 5,000 targets at 1½ cents each, or $15 per 1,000, they would receive $75 for targets, an amount $25 in excess of what they would have received had they added $100 and charged 3 cents for targets.

In regard to the practical work connected with the giving of a tournament: When a tournament committee is appointed, vested with full power to act, and a date selected that does not conflict with any other proposed event in that vicinity, then the real work of the committee commences, viz.: the arrangement of a proper programme which will serve to attract shooters. The preparation of a programme is generally looked upon as a matter of minor importance, and one that should not occupy much of its time. While this point, apparently, may seem an easy task, it is one of its hardest duties, and upon a correct arrangement of the details depends, to a certain extent, the successful issue of a shoot. It is quite easy to prepare a programme of a certain kind, but can it be carried to a successful issue? "Aye, there's the rub." Can it be? Events should be so scheduled and consist of such number of targets as will permit the running of two or more events at one time, if necessary, without interfering one with another. The proper way to do this is when your programme is arranged go over it carefully, shooting it out, imaginarily, with the greatest number of entries anticipated (entries are seldom underestimated, they are nearly always overestimated), in order to learn if each day's programme can be finished in due season. You will thus be enabled to amend or eliminate any events that may interfere or conflict with the smooth working of the programme. I call to mind at the present writing that the parties who were intrusted with the arrangement of the programme for the late E. C. tournament spent a great deal of time in a preliminary review of the work. The ashes had fallen from many a Perfecto, much seltzer-and-lemon, as well as other brain food, had been devoured for mental inspiration, and the gray dawn of the morning was peeping through the window blinds when the copy for that programme was finished and, with a sigh of thankfulness and relief, marked o k. That programme, with over 100 entries, four sets of traps, and a schedule of varied events was, with but a single exception on the first day, owing to inclement weather, carried out as arranged. The programme arranged for the Pennsylvania State shoot at Altoona was another instance similar to the foregoing. At the late State shoot held at Harrisburg, Pa., the programme, although given the most careful and conscientious preparation, was so arranged that it was with considerable difficulty that the many different kinds of events were kept moving.

When the programmes are ready for mailing, advance copies should be sent to the sportsmen's journals, giving them ample time to place same before their readers. The notice received is read by many thousands, and in return for this courtesy the scores should be promptly mailed at the close of the tournament.

Prior to the commencement of the shooting on the opening day it is the bounden duty of the tournament committee to have all the necessary paraphernalia on the grounds in proper position, as well as to have, by all means, a paid and efficient force of assistants on hand ready to commence the programme at the appointed time. The cashier's office is the mainspring of a tournament, and the best force obtainable is none too good. Appoint competent referees, who are just and firm, and the tournament committee should uphold them in their decisions. The duty of keeping the traps in perfect running order should be assigned to an individual member of the tournament committee, who should also see to it that the trapper boys do not take the targets out of the barrels and place them in piles around them; hundreds of targets are broken at tournaments by the trapper boys through carelessness in piling targets around them. The proper way to do is to open a barrel and place it on its side, having the trapper boy take out one package at a time and just as he needs it. Where at all possible, have a squad to lead off with who come to the score promptly when called and shoot rapidly, as they will set a good example to those who are dilatory and hard to get to the score. The suggestion presented as to the squad hustler is a good one, and he can often be excused if he retires to the rear of the club house and communes with himself profanely for a few minutes. Daily average money brings the shooters to the ground early and induces them to enter all events. High guns should always win this average money.

In presenting this article I am guided solely by a desire for the advancement and betterment of trap-shooting, and bringing it to the high plane where it, as a sport, deservedly belongs.

ELMER E. SHANER.

CLEVELAND, O., Oct. 26.—*Editor Forest and Stream:* Your article in the FOREST AND STREAM of Oct. 24 has interested me very much, as you know tournaments, tournament programmes and handicaps have been a hobby with me for some years, and any discussion in that line appeals to me with a great deal of force.

In the majority of the points made by you I agree entirely, but in some I must differ, and for the following reasons:

The main point you make is that a club should not give a tournament with the expectation or for the purpose of making money out of it. That I do not think is a defensible position, as in giving a tournament a club takes a large risk, if it adds any amount of money to draw a crowd, in having bad weather or a small attendance, and not being able to throw enough targets to make up a portion of the money they have added to the purses, and in consequence they will sustain a loss. I do not think there should be a chance of a loss without the compensating chance for a gain, and that no club should be asked to take these chances of loss for the benefit of the manufacturers of the goods consumed, or for the amusement of the shooters in attendance.

There is a great deal of hard work in connection with running a tournament, and a club should have a chance of making a small amount of money out of a shoot to pay for the trouble and extra expense they have been put to, in order to encourage them to give other tournaments.

THE 2-CENT TARGET CRITICISED.

At the present price of targets there is no question but that a charge of 2 cents for targets where money is added is too much, and that 1 and 1½ cents should be the outside charge in such cases. To my mind it is much better for a club giving a large tournament to make a small charge or no charge at all for targets rather than add $1,000 to the purses and then charge 3 cents each for targets.

At the Chamberlain tournament last year we threw the targets free of charge, 35,000 of them, which at a charge of 3 cents each was equal to adding $1,050 to the purses. I will admit that few shooters had figured out what throwing targets free of charge meant, but after their experience last year I know they realize it is equal to large added money.

Now a club can give a tournament of this sort, depending upon advertisements in programme and guarantees from club members to pay for the targets and running expenses, and not run any such chances of losing a large amount of money as they will where they add $1,000 or more and charge 3 cents each. We threw all targets, programme events, preliminary day events and extras, and made no charge; but a club could not be expected to do more than throw programme events free and make a charge of 2 cents for all other targets. In that way they could derive quite a revenue, as a great many targets would be shot outside of programme events.

THE LINDSAY HANDICAP FAVORED.

As to handicaps: To my mind the Lindsay handicap is the best and fairest ever used, and, if at all tournaments it will give the satisfaction that it gave the majority at our tournament, it will be very popular as it becomes better known. As you say, it makes extra work in the office, but a system can be devised that will lighten and quicken the work and not be much more troublesome than the ordinary methods.

A very good scheme was used by the Cleveland Gun Club at a small shoot given by it a short time ago that consisted of giving every shooter in attendance from out of the city a rebate of his railroad fare up to $3, provided he shot the two days' programme through. There were 300 targets on the programme and a charge of 2 cents each was made, so that in cases where they paid $3 rebate they only received 1 cent each net for targets. Under this system almost every man from out of town shot the programme through in spite of the fact that it rained in torrents for both days.

AVERAGE MONEY SHOULD BE PRO-RATED.

As to averages: I believe in making a large number of small averages, to be divided pro rata among all that have shot the programme through, as a better plan for holding the attendance than in giving it to a few who have been winning all the money anyhow and would stay if there were not any averages at all. In fact, I think if the idea of adding money to the purses is to draw a crowd that will stay and shoot the programme through it will prove far the better plan to divide all the added money pro rata among those that have stayed the programme through rather than add it in small amounts to the purses. Take the large tournaments of the last few years and in every instance almost you will find that most of the added money has been carried off by not to exceed ten men, and that nine out of the ten were paid to be at the tournament and should not have had a cent of the money at all.

PAID MEN AT TOURNAMENTS.

In your article you have said nothing at all in regard to the paid tournament shot, and I think the time has come when that matter must be taken up by the trap-shooting fraternity, the same as it has been by the bicycle riders, and settled in some more satisfactory way than at present. My idea would be to let all these paid shooters attend as many tournaments as they chose, shoot at all the targets they wished, paying for them at actual cost of trapping, which would amount to about 75 cents per 100, but not to allow them to contest for any of the purses or average moneys. If they wished to get up sweepstakes among themselves and let as many of the amateurs in as chose to go in, that is all right; but bar them from the regular programme events. These sweepstakes of course would be figured from the scores made in the regular events and would be run by themselves entirely; that is, the money part of it, the office having nothing to do with it.

This would give them an opportunity of showing the goods they represent to the shooters present, but would not drive away many ordinary shots who are fast finding out that where there are so many good shots in attendance at all the large tournaments, who are paid to be there and who follow the circuit week after week as it were, there is no chance for one that has to pay his own way to break even with the game.

Take any of the large tournaments of last year, and fully 40, if not 50 per cent. of the shooters in attendance were paid in one way or another to be there.

DOES NOT FAVOR THE ROSE SYSTEM.

You know I am not in favor of the Rose system, so there is no use in saying anything on that score. I think if at least one-half of the events were arranged so that contestants would have to shoot out the ties until at least entrance money could be realized, it would put more life in the game and make better shooters out of us than the present way of dividing, no matter what you get out of an event.

There is no question but what your article will be of a great deal of interest and value to your readers, and I hasten to criticise same in hopes that some one will criticise me also, and in that way stir up a healthful agitation that will result in the good of one of the best of outdoor sports.

PAUL NORTH.

Calumet Heights Gun Club.

CHICAGO, Ill., Oct. 24.—Seven members of the Calumet Heights Gun Club took part in the regular weekly shoot of that club held this afternoon. In class A Paterson was the only contestant. In class B there were two competitors, Metcalfe winning with 20 breaks. Messrs. Black, Harlan, Davis and Grey fought for first place in class C, Black winning easily with 17 breaks, losing 4 out of his last 5 targets. The shoot is at 25 targets per man, unknown angles:

A C Paterson (A)	1111111101101011100100001—16
Metcalfe (B)	1101011111111101111110110—20
Norcom (B)	0001110111110110101111111—18
Black (C)	1010111101111011111100100—17
Harlan (C)	0100001110101100011101010—12
Grey (C)	0001101011011001110001010—12
Davis (C)	1100011101000111000101001—12

Five sweepstake events were also shot during the afternoon. No. 2 was at 5 pairs, No. 3 "snipe" shooting; all the others were at unknown angles. Scores:

	No. 1.	No. 2.	No 3.	No. 4.	No. 5.
Paterson	11	..	..	12	10
Metcalfe	10	4	7	13	8
Norcom	10	2	4	11	..
Harlan	7	4	7	10	5
Black	..	..	10	14	5
Grey	..	4	3	12	..
Davis	..	1	7	..	..

PATTY.

Winston had an easy thing of it last Tuesday, Oct. 27, in his match with Langen, of New York. The "Count" stopped shooting in the 69th round, Winston leading him then by 9 birds, and shooting in too good form for there to be any chance of defeating him with only 31 more birds to shoot at.

In New Jersey.

ELIZABETH GUN CLUB'S BI-MONTHLY.

THE Elizabeth (N. J.) Gun Club held its eighth bi-monthly tournament on Oct. 27-28. The club was favored by exceptionally fine weather, but it requires more than fine weather nowadays to draw out the shooters of New Jersey when once the game season has opened. The attendance was extremely small, while the purses on the target (first) day were even smaller, only a few of those taking part in the sweeps putting up for anything besides "the birds." President R. E. Chetwood acted as entry clerk throughout the shoot; W. M. Parker, the old cashier of the club, occupied his accustomed position in the cashier's box. Mr. Parker is now in the employ of the W-A shell-loading department, but still makes his home at Elizabeth.

First Day, Oct. 27.

About 1,500 targets were thrown during the day, the programme of 12 events being shot out before 4:30, although the first event was not started until just about midday. The weather was simply perfect, not a breath of air stirring at times. Had the background been as perfect as the day some tall scoring would have resulted, as H. G. Wheeler, of Marlboro, Mass., and Ferd. Van Dyke, of the Winchester Repeating Arms Co., were in excellent trim. Wheeler made one run of 70 straight, all at unknown angles. The background at the Elizabeth grounds is a hard one, while the high board fence that surrounds the property of the club makes low-thrown quartering targets extremely difficult to get on to, unless the shooter catches sight of them the instant they top the screen.

Among those present were W. F. Parker, son of the inventor of the Parker gun, and late president of the firm of Parker Bros., of Meriden, Conn.; Mrs. M. F. Lindsley, who was much pleased with the showing made by Wheeler, who shot both King's Smokeless in Peters's shells, and U. M. C. factory-loaded smokeless shells loaded with E. C. powder, and landed with high average. M. Herrington, of the U. S. Smokeless Powder Company, was also present and came on the ground late; he usually shoots well on these grounds, but on this occasion he was clearly out of form.

The programme consisted of 175 targets divided into twelve events. All these events, with the exception of Nos. 4 and 6, were at unknown angles. No. 4 was at traps pulled in reverse order; No. 6 was shot expert rules, rapid fire, use of both barrels. Scores:

Events:	1	2	3	4	5	6	7	8	9	10	11	12			
Targets:	*10*	*10*	*15*	*10*	*20*	*15*	*20*	*15*	*25*	*10*	*15*	*10*	Shot at.	Broke.	Av.

Waterbury....	..	..	..	..	..	..	..	8	..	5	9	..	40	22	55

Dackerman shot in No. 10 and scored 7.

Two extras were also shot, the first being at 5 pairs. In this event the scores were: Edwards, Van Dyke and Woodruff 8; Wheeler and Williams, 7; Herrington 6.

Extra No. 2 was at 25 targets, unknown angles. Scores: Edwards 22, Herrington 20, Astfalk 19.

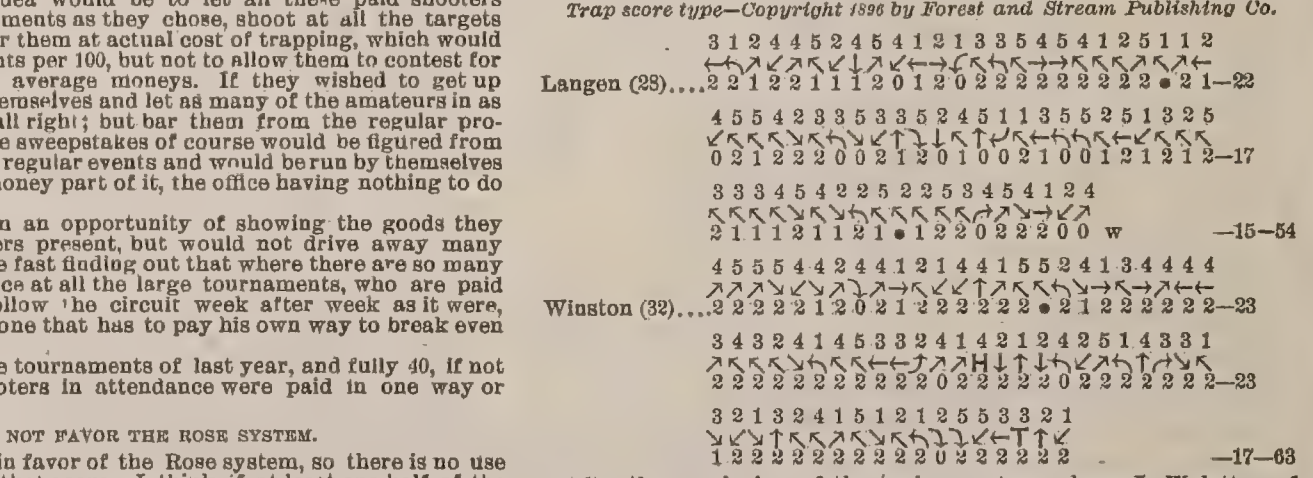
INDEPENDENT GUN CLUB, OF PLAINFIELD.

Oct. 20.—The Independent Gun Club, of Plainfield, held a shoot this afternoon, both live birds and targets being trapped. The scores in the live-bird event (8 live birds per man, 23yds. rise, $5 entrance, three moneys) were:

Codington	2222210121—9	Pierson	01101•0011—5
Wheeler	01211•1211—8	Smalley	1010011•0•—4
Haurand	1111101•22—8	Smith	010•100010—3

Three events, all at 10 targets each, unknown angles, were also shot during the afternoon. The scores in these events were:

Events:	1	2	3	Events:	1	2	3
Dr Cooley	3	2	..	Lister	4	6	..
Wheeler	9	7	9	Codington	4	6	10
Smalley	8	6	4	McCullough	..	5	8
Hui	7	5	..	Pierson	..	6	10
Smith	6	4	4	Reed	..	..	5
Haurand	8	9	7				



AT ELKWOOD PARK.

Oct. 27.—The return match between J. L. Winston and Langen, of New York, took place at Elkwood Park. The day was not a good one for the birds, as not a breath of air was stirring. Winston scored the easiest kind of a victory, Langen withdrawing after losing 15 birds out of 69 shot at. Winston found the birds to his liking, and scored 63 out of 68 from the 32yds. mark. The conditions of the match were 100 live birds per man, $147 a side, Hurlingham rules, Elkwood Park boundary, Winston at 33yds., Langen at 38. The traps fell as follows:

	No. 1.	No. 2.	No. 3.	No. 4.	No. 5.	Total.
Langen	10	14	13	14	18	69
Winston	14	13	11	20	10	68

Langen's longest run was 15, although he scored 22 out of his 25. Winston made runs of 19 and 18. The match started at 1:37 and was finished at 3:20. The first 50 were trapped in 38 minutes, second 50 in 42 minutes, the other 37 were trapped in 23 minutes. Full scores follow:

Trap score type—Copyright 1896 by Forest and Stream Publishing Co.

After the conclusion of the main event as above, L. Finletter, of Philadelphia, shot a couple of 25-bird races with Langen, both men using one hand, Finletter stood at 30 and Langen at 28yds. rise. They broke even on the two matches, Finletter winning the first by 23 to 21, Langen winning the second by 21 to 20.

Three miss-and-outs, $10 entrance, were also shot, as follows:

	No. 1.	No. 2.	No. 3.	No. 4.*	No. 5, 10 birds, $10.
Langen	2	1•	10	1121220	000w
Ivins	0	12	12	1212222	221 } Divided.
Finletter	2	11	22	20	222 }

* In No. 4 Langen missed his first bird and re-entered; he then missed two more in succession, his third re-entry resulting as above.

PUBLISHERS' DEPARTMENT.

Hunting the Wild Goat.

THE white goat, or Rocky Mountain goat, as it is indiscriminately called, is a species of big game rarely hunted by sportsmen. This is not so much because of the difficulty of killing the animal, nor because of its actual rarity. It is a stupid animal, easily shot when once found. It is not, however, shot in the usual hunting grounds, as are bears, deer, elk, etc. It is remote from the common localities, but where found is in goodly numbers. It ranges very high up in the mountains—above the timber line usually—among the rocks and cliffs. This requires great labor to get to it, but once there the hunter will get his game nine times out of ten.

If you care to read of a goat hunt made in the Bitter Root Range in Montana, in the fall of 1895, send 6 cents to Chas. S. Fee, General Passenger Agent, Northern Pacific R'y, St. Paul, Minn., for "Wonderland, '96," which recounts such a hunting expedition.—*Adv.*

Sunday Service Discontinued.

THE Fall River Line announces the discontinuance of their Sunday boat service, the last Sunday trip for the season having been made on Oct. 25.

Commencing Nov. 2 the boats of this line will leave New York at 5, instead of 5:30 P. M., as at present.—*Adv.*

ANSWERS TO CORRESPONDENTS.

T. E. B.—For quail and rabbits on Long Island go to Lindenhurst (Glister's Hotel), Eastport (H. J. Rogers), or Mt. Sinai (L. A. Turner). You would do well first to write to the addresses given.

FOREST AND STREAM.

NEW YORK LIFE BUILDING

Present Entrance on Leonard Street

THE FOREST BELONGS TO THE PEOPLE.

THE proposed amendment of the forestry section of the New York Constitution, to permit the leasing of the State's wild lands in the Adirondacks to private parties, was rejected on Tuesday of last week by an overwhelming vote. The official figures have not yet been given out, but the majority against the amendment is estimated at three hundred thousand.

If any one has been cherishing a lingering doubt of public sentiment respecting the Forest Preserve, he must have had his uncertainty dispelled by such a verdict. We should think that even the president of the Forest Commission himself might now have some slight inkling of how the people regard their forest possessions and how they mean to defend these possessions. "We believe the amendment a desirable one, and officially recommend its adoption," wrote President Davis in his officious manifesto. The people's answer to that was given in their vote of three to one against the impudent job. Under ordinary conditions, with public attention not so thoroughly engrossed in great national issues, the three hundred thousand would have been a million; the vote would have been practically unanimous.

The question of who is to own, occupy, control and enjoy the Forest Preserve may now be considered settled for this generation at least. The safe rule, which before the election was embodied in the Constitution, remains unchanged to-day. It is worth while reading that declaration again; here it is:

Forest Preserve.—Sec. 7. The lands of the State, now owned or hereafter acquired, constituting the Forest Preserve as now fixed by law, shall be forever kept as wild forest lands They shall not be leased, sold or exchanged, or be taken by any corporation, public or private; nor shall the timber thereon be sold, removed or destroyed.

FATE OF THE FUR SEALS.

A CRISIS has come in the life history of the fur seals of the Pribylov Islands. The United States and Great Britain having failed to come to an agreement for an adequate system of protection, and the report of the investigating commission sent out by the United States showing that under existing conditions the seals are doomed to extermination, three courses are now open. The first is to permit the slaughter to go on as it is now proceeding, the seals being killed on land and at sea; this means the certain extermination at no distant day. The second course is the heroic solution, proposed in Congress at the last session and not yet acted upon, to kill off all the seals on the islands, male and female, sell the skins for what they will bring, and so have done with the seal problem now and forever. As we have said before, this would be nothing short of a humiliating confession that the most advanced civilization of the day is not competent to deal with the simple problem of protecting a wild species. The third course is by renewed effort and in the light of the latest investigations to come to an understanding by which the United States, Great Britain, Russia and Japan shall unite for common protection of their sealing interests and to devise and abide by a system which shall conserve the parent supply.

All that has been charged against pelagic sealing is substantiated by the investigations made by Dr. David S. Jordan and the other members of the Behring Sea Commission for the study of the seal question. A statement of the results of the work of the Commission, given out by Dr. Jordan, says:

Dr. Jordan and Mr. Lucas report that they are well satisfied with the work of the summer. Every phase of the life and history of the fur seal has been critically studied, and all points heretofore in dispute have been settled beyond cavil. The first detailed census of fur seals has been made and the first complete examination of the various causes of their death. The conclusions reached last year by Mr. Townsend in the study of killing seals at sea have been confirmed in every particular. A detailed report of the work of the summer will be sent at once to the Treasury Department.

There is still a vast body of fur seals on the islands, more than the Commissioners were first led to expect, but the number is steadily declining. The only cause of this decline is the killing of the females through pelagic sealing. The females are never molested on the islands, but three-fourths of those killed in Behring Sea are nursing females. The death of the mother causes the death of the young on shore, so that for every four fur seals killed at sea three young pups starve to death on shore. As each of those females is also pregnant, a like number of unborn pups is likewise destroyed.

Pelagic sealing as an industry has already cut its own throat, as the fleet this year will not pay expenses. The killing of surplus young males, as provided for by law, has always been a benefit to the herd. The Commissioners believe that the way is open to an honorable and amicable settlement of this question in a manner highly satisfactory alike to the United States and England and to Canada. There can be no longer any difference of opinion as to any facts in question.

The high character of the gentlemen selected by the British Foreign Office and their unquestioned ability give reason to believe that England will favor a prompt and equitable adjustment which will give ample protection to the fur seal herd. But the duty of the present Commission closes with the statement of facts in question.

It is announced that Russia and Japan will join the United States and Great Britain in any efforts that may be made to secure protection for the seals. With the co-operation of these four powers, pelagic sealing could be stopped, and unless it shall be stopped it is clear that the seals must perish.

A TEXAS CRAZY QUILT.

WHEN the newly organized Texas Game Protective Association was forming, we suggested that it could perform a valuable public service by securing the repeal of those special exceptions by which more than one hundred counties are exempted from various provisions of the law. The most serious of these exemptions is that relating to the netting of quail. This constitutes an extensive industry, and is tremendously destructive. As our columns have reported, the outlook for quail in Texas was extremely bright at the beginning of the season. Now, as a direct result of netting, in certain localities where these birds were then most numerous scarcely any are to be found. They have been sent to market. The Association's secretary, Mr. Turner Hubby, reports that his efforts to enforce the law against the netters are seriously impeded by the difficulty of proving that netting was done in counties where it is illegal, and not in adjoining counties exempt from the law. The State of Texas, says Mr. Hubby, is checkered like a checkerboard with exempt counties, and it is almost impossible to disprove the netter's claim that he took his birds where the law says he may.

The checkerboard figure is a happy description. We have looked up the exempt counties on a map of Texas and have indicated them roughly in a diagram printed in another column, the portions of the map in black indicating the territory to which the game law, as to some of its provisions, does not apply. The result does not look very much like a checkerboard; it is more of a crazy quilt.

Checkerboard systems of game protection can never amount to much. A crazy quilt system is more worthless yet. We trust that the Protective Association may be so successful in its efforts to break up present conditions in Texas that the FOREST AND STREAM may be privileged to print a new diagram of the State which shall be white throughout.

TECHNICAL TERMS.

"PARADISE" is the conventional designation employed to signify a region rich in game or fish when spoken of in the rosy, superlative and flamboyant language of the sportsman. No term significant of perfection in a less degree will answer the requirement. Paradise it is, and nothing short of it. We reckon that the word is used in the FOREST AND STREAM more frequently than in all the lay papers put together; we guess that no other word will be found to take its place; and we calculate that its use will grow rather than diminish.

"Boss fisherman" is an expression enjoying still wider vogue, although of infrequent occurrence in the FOREST AND STREAM. It is terse, robust, vigorous, and more expressive than elegant. There are occasions when no less significant term would take its place. One such instance was the meet of the Fremont Fishing Club, of Maryland, the other day, when the members took part in an oyster eating contest, Mr. Patrick Baylis eating five pecks to his highest competitor's three pecks. If Mr. Baylis is not the "boss fisherman" of the Fremont Club, and of Maryland for that matter, by what other and more fitting title shall we herald his name and fame?

"Porcupine fishing" and "angling." Porcupine fishing is a term given official recognition by the Vermont Fish Commission in their report for 1896. It is used to describe the method of fishing whereby one man uses from four to twelve poles in one boat. The practice has been forbidden by law in Vermont, as in New York and elsewhere, by limiting the mode of fishing to angling, and defining angling to mean, as the New York statute reads, "taking fish with hook and line and by rod held in hands, and does not include set lines. In fishing from boats, rods and lines not exceeding two in number may be used by any one person."

WHO OWNS THE GUIDE'S GAME?

WHEN a sportsman hires a guide, and the guide takes part in the shooting or the fishing, to whom does the game or the fish secured by the guide belong? The question has just come up in a case related by a correspondent who returned last week from a ruffed grouse shooting trip. He tells us that he cut short his intended stay, although birds were abundant, because of a misunderstanding respecting the disposition of the birds killed by his guide when in company with him in the field. The guide being in his employment and being paid by him, he had assumed that in conformity with the unvarying custom followed elsewhere throughout his shooting experience of thirty years the birds killed by the guide would belong to the employer. It appears, however, that this was not the understanding held by the host, who advised his guests that the birds killed by the guides belonged to the house and would be sold at so much a pair if the sportsmen wished to retain any of them for taking home. This was regarded as an imposition, and our correspondent's stay was thereupon terminated.

We believe it to be the invariable rule that, unless a different understanding is had in advance, the product of a guide's services in the field, as of a boatman's on the water, belongs to the man by whom he is employed and paid. We have never heard of an instance before this one where a sportsman was expected to pay wages and then in addition to buy the game secured by the guide while in his employ. We would be glad to hear from any one who has knowledge of a contrary custom.

GOOD THINGS EVERY WEEK.

WE would be perfectly willing to abide by the estimate of the merits of FOREST AND STREAM as a sportsman's journal if the finding were to be based upon the record of the latest six issues, or of the six before those, or of any six still further back. The fact is that we have been providing in these pages every week the most generous, varied and entertaining literature of the field ever put into print in a single publication.

And there are just as many good things to come in the weeks that shall follow. Mr. Fred Mather will continue to entertain us with his charming reminiscences of the men he has fished with. Mr. S. T. Hammond, the not forgotten Shadow of earlier years, will write of some companions he has hunted with in famous covers of Massachusetts. Kingfisher is under pledge to tell of some of the recent camps, or forever after to hold his peace. There will be given, under the title of Stories of the Heroic Age, a series of chapters of adventure on the frontier in the Indian days. The next Audubon plate, that of the "Canvasback Duck," will be contained in the issue of Nov 21.

Thus the FOREST AND STREAM has in store for its readers good things every week.

WHY DOES THE BOY TAKE THE FLY?

COLUMNS and columns of space have been consumed in the angling journals in an endeavor to show why the salmon takes the fly. Some say that he does it because he is hungry, others because he is in sportive mood, and others again because he is enraged and snaps at it in anger as the bull dashes at the red flag. After all have had their say, we can only fall back on the one certitude, that the salmon takes the fly because it is salmon nature to take flies.

Why does the small boy take the fly? Let a butterfly, moth or miller venture into the plaza of City Hall Park or into any of the down town streets where boys congregate, and on the instant caps come off, arms are wind-milling in air, and there is the wildest excitement to capture the insect. Why and what for? An idle question. There is no reason. It is just boy nature. We have humane societies engaged in well-meant endeavors to educate the boys not to chase butterflies; they may achieve their most commendable purpose in individual cases, but the boy will go on chasing butterflies as long as boys are boys and butterflies fly.

The Sportsman Tourist.

A TENDERFOOT IN COLORADO.

THIS is an attempt to describe an expedition after elk, deer and other game to the extreme northwest corner of Colorado. It is not intended as a manual for experienced sportsmen, nor to take the place of Van Dyke's "Still Hunter" or Roosevelt's graphic books, nor will the skilled Western hunter find in it any suggestions by which he may guide his future career. It is a record of the personal experience of a tenderfoot, who had shot some deer and caught some trout in less favored regions, and who writes with the earnest desire, which will doubtless prove fruitless, to give his own kind of sportsmen some idea of the charm of the wild portion of the Western country, and of the pleasures which may still be found there. A portion of my experiences have been already published, "Impressions of a Tenderfoot," FOREST AND STREAM, December 8, 1894, but I hope that a more detailed account will not be uninteresting. Should it prove so, the fault will be in my lack of ability as a word painter and not in the real charm of the things I am trying to depict.

It was in the fall of 1894, and I was invited to join a party already established in Routt county, Colorado, and reported to be camped on the eastern slope of "Anita" or "Bear's Ears" Peak in the Elkhead Mountains. My personal outfit, which proved entirely satisfactory, was about as follows:

One Winchester repeater, model 1886, with Lyman sights.
Two hundred cartridges, .45-90-300, solid ball.
One stout jackknife. One compass.
One suit heavy woolen clothing.
One pair heavy woolen trousers, extra.
Two pairs of heavy shoes, with soft hob-nails.
Lot of heavy and medium weight flannels.
Two heavy sweaters, much more useful than an overcoat.
Heavy flannel shirts and worsted socks.
Brown slouch hat.
One pair canvas leggings.
Two pairs heavy dogskin gloves for riding.
Camp mattress, with cover and straps to roll.
Two pairs heavy blankets; one pair made into a sleeping bag.
One small feather pillow.
Cigars, matches, etc.
One canvas war bag, about 2ft. 6in. × 4ft. 6in. Catch all.
One possible sack, 1ft. × 2ft., for small articles.

There were to be three of us in the field and we had contracted with Mr. J. W. Baxter, of Glenwood Springs, Col., for the general outfit needed; this consisted of about the following, and was all furnished at a fixed and very reasonable price per day:

Mr. Baxter himself as chief guide.
Wallace Baxter, guide and horse-wrangler.
Cale, cook—I do not know his last name.

These men were admirable in their respective departments, and were individually a fine lot of fellows. They were as free and equal as the Declaration of Independence. Ready, able and willing to do the work they had contracted for, but not considering that they were in any way inferior to the other American citizens who formed the party of the second part (and they were exactly right), faithful, untiring, experienced, good-natured, quiet and soft-spoken, not one using liquor or tobacco, on the whole as good men as could have been found, if not better than any others. Cale is worthy of a chapter to himself. A big, burly fellow, with a great red mustache hanging over his mouth, white slouch hat on the back of his head, leather-fringed chapparejos and Mexican spurs. When he bestrode a broncho, swung a riata in his right hand, held the reins high in his left, cowboy fashion, and sent his bucking, squealing mount over logs, brush and rocks, he looked more like a bandit than one of the peaceful profession. But how he could cook! Shall I ever forget his blacktail steaks, his elk soup, and last, but not least, his flapjacks—just the size of the long-handled frying-pan, and turned over by a toss into the air. Nothing was ever better, if so good.

But I have got away from the outfit, and must come back to business again.

Three tents, about 10×8ft.; sheet iron cook stove, four folding chairs, two camp-stools, table (this consisted of only the top and cross pieces, the legs being cut anywhere and driven into the ground until level). Pots, pans, kettles, etc., packed in stove. Knives, forks, plates, cups, etc., for six. One hundred dollars worth of supplies, which we paid for. Pork, flour, potatoes, canned goods, jellies, spices, caviar, pickles, beef extract, etc. No whisky; you do not want it at that altitude, except for medicine. The beef extract is much better.

Twenty-four bronchos, with saddles, pack-saddles, etc. Of this lot of horses six were constantly in use under saddle, fourteen carried packs and four were extra horses.

No feed is carried. At night the horses are simply unpacked or unsaddled and turned loose. They find their own food and rest. One of them carries a bell, and the bunch can generally be trusted to stay pretty close together and not to stray very far away. This trust, in the latter particular, is not always deserved, and then the guides have a big job on hand and traveling must be suspended until the drove is found and driven back into the corral. These horses are half wild and will rarely submit to be caught singly; so the first job after going into camp, when the tents have been pitched and the fire lighted, is to build an inclosure of brush, limbs, ropes and other obstacles, into which the herd may be driven when wanted.

The pack horses when traveling carry about 150lbs. each, sometimes more, and string out into a long line in Indian [illegible] At the head of the procession goes the chief guide, [illegible] way, with a keen eye for known landmarks [illegible] bilities of wood, water and grass. After [illegible] train, each horse following in the [illegible] nding, and making the same turns and tw[illegible]mes the horse-wrangler, driving up the [illegible] looking out for accidents, and only too apt to [illegible] ounded by a blue and glittering cloud of strong langu[illegible]ge, which would seem censurable to a novice, but is soon realized to be the almost necessary accompaniment of the position, human and horse nature being such as they are. At varying positions in the line are the "cook and the crew of the captain's gig," helping over difficult places, galloping ahead after game or delayed in its pursuit, but never very far from the main body. The train goes at a walk, and makes no detours for hills or valleys, but crosses everything as it comes. It will travel about twenty-five miles a day over rough and trackless country, and do but little more on a road, if it ever gets to one, which it does not often do, for there are no roads in this country except along certain main lines of communication and very far apart. It is an absolutely wild region, in which the only paths are those made by the game in their journeyings for centuries. So over every divide and along every stream and valley you generally see a well-trodden and distinct path, often beaten down some inches below the surface of the ground, and this follows the easiest course there is to be found. Perhaps there is no easy course at all, but the trail can be depended upon to take the best there is to be had.

But this has been a tremendously long preface, and I fear the personal adventures will be a small tail to so big a kite; still perhaps the preface may be useful while the main work will be neither useful nor ornamental; in any event let me come back to my story.

From Colorado Springs we, my brother Wolcott and myself, took the evening train West on the Denver & Rio Grande, and early next morning landed at Wolcott, in the cañon of the Eagle River, and on the western side of the Continental Divide. Having some hours to wait for the stage, we got out our fly-rods and succeeded in extracting a few trout from the beautiful river; these I dressed and the obliging landlady cooked them for our dinner. This was my first introduction to the black-spotted Rocky Mountain trout (*Salmo purpuratus*, Goode)—and he is a fine fellow and worth knowing. Quite different in his habits from the *Fontinalis*, at least in my small experience, both in the parts of the stream he is found in and the character of his rise to the fly; but a dashing and vigorous fighter and very good on the table. We got nothing of any size here, but afterward, in the Cañon of the Yampa below Steamboat Springs, took plenty of them up to 2lbs. in weight, and were sure that longer effort than we could give would have developed mighty ones from the magnificent pools of that glorious trout stream.

At noon we climbed into the stage which was to take us to Steamboat Springs, about eighty miles due north, and to consume a day and a half in doing it. The vehicle was what is called a mud wagon—seats for six, a cotton top, the bottom filled with mail bags and our own traps, until places for feet were hard to find, and harnessed to two bronchos. Following a small creek valley, we slowly climbed for hours until the divide between the Eagle and Grand rivers was surmounted, and then rattled down to the Grand Valley at a speed and over roads which seemed to me anything but safe. Realizing my greenness, I had self-control enough to hang on and keep my mouth shut, while the driver whirled us down the grade and around curves with a clear drop of 100ft. (and it looked like 1,000) on the outer side of the road and within a few inches of the wheels. I am pretty sure that fellow knew he had a tenderfoot on board, and wanted to extract an appeal for more care; if so, he did not do it, mainly because I realized that we must all go together, if anybody went, and that he was probably no more anxious to be smashed than I was. We crossed the Grand River at the end of this trying grade, and then followed its course downward for several miles, over a succession of ups and downs, as we crossed little valleys at right angles to the stream, finally bringing up about 6 o'clock at a little hotel on a small lateral creek. I hurried to get my rod together, and, walking some distance up the stream, managed to get four nice mountain trout before dark, though the last one was taken after the stars were well out. These made a capital breakfast next morning, and were a good preparation for the long and slow climb to the top of the divide between the Grand and Yampa (or Bear) river valleys. Once over this summit, we followed the Yampa from almost its first beginnings until at Steamboat Springs it makes a great bend to the west, being then a full-grown river. We were constantly tempted along its course by glimpses of most entrancing trout holes, growing finer as the stream grew larger; but had self-control enough to resist temptation and keep on. This was a great mistake, and I here want to lay down the general principle that when a trout fisherman finds good trout water his highest duty is at once to fish that water. Any other course will bring only sorrow and unavailing remorse to his declining years, and, like Kipling's "Mugger of the Ghaut," he will be always haunted by visions of the prey that escaped him.

Somewhere about noon, as we were traveling through Egeria Park, came our first sight of big game—a series of black points on the sky-line of a ridge a mile or two off, which the glass showed to be a band of some dozen antelope. It was hopeless to get near them in that commanding situation, so we did not try it. The country along our entire journey was decidedly arid, having few trees except close to the stream, and the low hills being boulder-strewn and as little cultivable as an ash pit; but the river was beautiful, the odd buttes of trap rock were striking, and now and then we caught a view of rugged and distant mountains to the westward, which were grand. The air was glorious, the sunshine superb, and the little bronchos behaved pretty well for bronchos, so the day's ride was a pleasure, and never tedious.

Steamboat Springs, which we reached about 6 o'clock, lies just west of the main divide of the Rockies, and we could see the trail along and over the mountains to the eastward by which North Park is reached. We were too tired to try the famous hot baths of natural spring water, and a rather poor supper and very hard beds were most welcome. A very large and fine elk head hung in the hotel office, but the horns did not look just right in color, and, after some inquiry, I found that they had been picked up in the woods, stained to about the proper color, and fitted to the scalp of a cow elk; and was told that preparing heads for sale in this manner was a regular and profitable business, especially since elk with fine heads were so much more rarely shot of late years.

At Steamboat Springs Baxter met us, bringing saddle horses for ourselves and a couple of pack horses for the luggage, and we started at 6 o'clock the next morning on our forty-mile ride to camp. That ride is one of the most pleasant and one of the most painful of my memories. Until toward noon we occasionally followed what might by extreme courtesy be called a road, and might in places be traveled by wheeled vehicles without extreme danger; then we took to the woods, to game trails, to fallen timber, to precipitous hillsides covered with boulders, logs and brush, and to all sorts of places which, to my ignorance, were absolutely impassable to horses. Riding, as I had understood it, was out of the question, the only things to do were to let your reins loose, hang to the high pommel, balance as well as possible and pray. All these I did, as well as several other things. But no ground seemed to make any difference to our bronchos. They climbed, jumped and slid with perfect success and apparent unconcern, doing as many impossible things and as easily as a trick bicycle rider. All this could not be done without fatigue to the rider, especially if, as in my own case, he had not touched a saddle for two years, and about the middle of the afternoon I was ready to sit down (no, I had had sitting enough and to spare), to lie down and rest. But there was no hotel in that wilderness, the only supper and bed to be had were at the camp, and I had to bear it, though past grinning. Now the region was really mountainous, the higher ridges clothed with timber and the stream valleys luxuriantly green, even the lower ridges were covered with scrub oak, and we frequently saw deer. About 4 we came out into California Park, an open, sagebrush-covered oval, about ten miles by five, through which the Elkhead Creek flows. Here antelope were abundant, and we must have seen a hundred while crossing the park. On its northerly side we came to a wall of timber, abruptly bordering the desert plain, and beyond it could see the double summit of the peak to which we were bound. I have not any very definite recollection of that last six miles through the trees. They were rough, tangled and tedious, and I was too tired to talk or think. When at last the welcome tents showed white through the trees and the journey was over I was almost too tired to know that rest was possible. If any man thinks me a weakling, let him try thirteen hours in the saddle and forty miles over mountains, and then send me his revised opinion.

Camp Buckhorn, as we named it, was pitched on the edge of a glade about 200yds. in diameter and of irregular shape, traversed by a tiny mountain brook and surrounded by magnificent red spruces, some of them 3ft. through and over 100ft. high. To the west the ground rose on a rapid slope for a mile or so, from which there soared the twin summits of "Bear's Ears," a precipitous mass of purple brown trap, with only a few cedars clinging to its crevices. The peak is supposed to be 10,500ft. in altitude, and our camp was somewhere near 1,500ft. below the top.

BUCKHORN GAME.

All around the peak was forest, regions of spruce alternating with the more open aspen trees, and all permeated by a maze of open glades, or "parks," of all sizes and shapes, and connected more or less. The air, rarefied by our near approach to heaven, and perfumed with the fragrance of evergreens, was a constant cocktail; and the sun, through that clear atmosphere, had a radiant glory which made one want to shout and sing. I found no disagreeable symptoms result from the great altitude, except that one couldn't stop breathing, say to whistle a bar, without having to gasp a little to catch up with his supply of oxygen. The stimulating air made one feel equal to any exertion, but experience showed that uphill work must be taken slowly to avoid extreme though temporary exhaustion.

A good supper and the heavy and dreamless sleep of fatigue made another man of me next morning. Baxter himself was assigned to take charge of the tenderfoot and insure him a shot. There was an inch or so of snow on the ground when we started, though it did not lie there long. Following the stream downward for half a mile, we turned to the west, climbing the mountain through a succession of beautiful little parks. Not a mile from the camp we came on the first game, a blacktail doe and fawn cropping the grass at the edge of a little glade. The breeze blew from them to us, for one must hunt up wind, and we stood for two or three minutes and watched the pretty things at not over 50yds. off, and the clearness of the air made them seem much nearer. I do not shoot does myself, and even a less scrupulous hunter would have found it hard to pull trigger at that family party; so, after having gazed our fill, we started them with a shout, not a shot, and they bounded off none the worse for us. We kept on into a heavy spruce forest, and I soon lost all sense of direction, and followed blindly in the guide's footprints. Soon he began to seem interested, but said nothing, which was one of his habits, till he beckoned me up, pointed to the left and said, "There's an elk. Shoot it." I could not make out anything that looked like an animal in that chaos of tree trunks and fallen logs, all gray and brown, but strained my eyes in the indicated direction and finally made out that a grayish-brown ridge, just showing over a fallen tree, was the back of a cow elk, and that a dark knot just beyond was an eye turned full on us. The rifle went to my shoulder; I took one step to the left for a clearer view; the ridge and knot vanished; there was a tremendous crash in the timber, and I had missed my first chance. How I did mentally kick myself all the way back, for we saw no more elk, nothing but blacktail does and fawns, and that day's hunt was a failure. It was some consolation, however, to find that the others had done no better.

The next day the guides took care of the other two hunters, and I only tramped round near the camp, trying to catch some trout out of the little stream, which falls below prevented, as I afterward discovered. Within half a mile of home I saw a dozen or more deer, all does and fawns, for the bucks were lower down, as we found later. The day after was one of great experience. Baxter and I traveled over nearly our former course and struck the trail of quite a band of elk. I was sent off to one side, leaving my horse with the guide, while he followed the trail. Presently came the crash among the trees, and a whole band of elk passed me at about 100yds. off, giving no chance for a fair shot. I determined not to let them go without an effort, and started to follow the trail, which was very distinct, and led me down the mountain for a mile or so through dense forest. This ended at a little brook at the foot of the slope, bordered by a wide park, at the other side of which I made out a solitary cow elk. There was no cover for a stalk, and I had to try the shot, though the distance was fully 600yds.; and I made a clean miss. Now, with all the confidence of a greenhorn, I determined not to again climb the mountain, but to follow the little stream until it intersected that on which our camp was located, as I knew it must, and then follow the latter home. This was well planned, but I did not know that the two streams ran nearly parallel, divided by a ridge, and came together five or six miles below the camp; so I started down the valley. It was a delightful walk through a succession of parks, but began after an hour or so to seem pretty long, and I anxiously looked out for the home stream. Suddenly, from among some fallen timber to the left and above my trail, there sprang to his feet a splendid buck aroused from his day sleep, and stood looking straight at me. In an instant the rifle was swung into position, and at the shot the buck simply let go everything and dropped in his tracks. It did not take long to cover the 80yds. of hill that lay between us, and I found him stone dead, with the bullet mark just between his eyes. It took some time to bleed him and tie a white handkerchief in a conspicuous place to find him by, and, when I had got started again and finally found the stream sought for, daylight had nearly gone and a strange country was all around me. It was evident that to get to camp in the dark was practically impossible, so reconciling myself to the inevitable I picked out a knoll where there was a supply of fallen aspen timber and prepared for a solitary camp. The first requisite was a fire, and I found only two matches in my box. These must be made to do the work. So I got together a lot of deadwood, carefully cut shavings and arranged the pile, lighted the first match with the greatest care, and made a success at the first try.

Soon there was a fine crackling fire, and it was good company as I perched on a pile of bush and began to figure things out. Here we were a long way from camp, but on the right stream, and able to get home when daylight came again. Good. There was no supper, but a couple of cigars were still on hand, and the buck would make a good breakfast, after which I was sure camp could be reached all right. Good again. There was abundance of fuel, and a big pile was soon gathered, a lot of bushes cut and piled for a bed, and into a mound to keep off the wind, and I settled down for the night. The sun went down and the stars came out, and there is no denying that it was lonesome, and that there seemed to be a great deal of space all around me. One could not help thinking that his proper place was in civilization, and what a fool he had been to travel 2,000 miles just to get lost in the Rockies; but the thing was done, there was no help for it, and one must just make the best of it. The hours crawled along, and the fire made me drowsy, so that somewhere about 11 o'clock I was at least three-quarters, possibly entirely, asleep. A little distance up hill from me ran a deep-trodden game trail, and suddenly I was started broad awake by a loud "Woof" from that direction. Nothing could be distinctly made out, but a big black mass a few yards away gave another "Woof" and then made off into the shadows. Did I investigate him? Not much! I hugged my rifle and my fire, and was only too glad to give him the rest of the State, and thankful that the grizzly did not need me also.

It was only a little while after this that I heard a rifle shot far up the valley and answered it; before long there was another and it was again answered, but when the third came, now not more than a mile away, my hammer clicked idly, for the cartridges were out. This was the lonesomest thing of all, but it was not long before my friends got within shouting distance, and Baxter and Percy arrived with horses and took me back to camp, which we reached somewhere about 2 in the morning.

It might only be tedious to describe the succeeding days, though they were far from tedious to us, being most delightful and fairly successful, both with deer and antelope, though we were soon met with the difficulty that we had all the venison we could use, and that killing any more meant useless slaughter. So, though the deer fairly forced themselves on our notice, we stopped killing them and devoted ourselves to the greater and rarer game. We were not lucky in striking elk for several days. Finally Wallace, Wolcott and I had climbed the mountain and were circling the peak when we heard a bull whistle below us and not far away. Instantly we were off our horses, let the reins trail on the ground and started on foot toward the sound, finally coming to the edge of a little park, when I heard Wallace give a sudden low call. Just in front of me was an opening like a port-hole through the last trees, and through this I suddenly saw, standing still in the middle of the glade, and under the full light of the sun, the most magnificent thing I had ever beheld. Imagine an animal with all the grace and beauty of a deer, and five or six times as big. He had heard a strange noise and was standing at attention, every muscle tense, and his head lifted until his splendid antlers seemed, allowing for excitement, to touch the sky. I did not stop long to admire, and my rifle boomed the instant the white bead showed against his shoulder. The smoke hung in the foliage so as to conceal everything in front, and I heard a second shot as I dashed through it. There was the elk in full run straight away from us, with our dog Queen close at his heels; but before I could shoot again there was another shot close beside me, and the great bull came down on his haunches, the ball having struck the spine and paralyzed the hindquarters. The dog leaped at his throat, and he struck at her with his forefeet and antlers. I do not know exactly how we got there, but just as we arrived the splendid head went down and the grand animal was dead, my first shot having struck just back of the shoulder and gone clear through both lungs. That was a grand moment; and, by the way, the very best seat in the world is the flank of a bull elk which you have just killed yourself, and the first one is much better than the second.

I have already told of the much larger head which fortune sent to me at the very end of our vacation, and will not try to give further details of our experiences, though I might go on indefinitely with tales of our later doings. How we chased the antelope over the plain, which is rather barren amusement; how I stalked a big buck, and he saw me through a hill and a grove of aspens, spoke contemptuously of me in antelope language, and cut his stick. How some bear hunters camped below us without advertising their presence, turned their yellow burros into the timber, and I took one for an elk, shot it, and had to pay for it. How the bronchos bucked when we came to break camp and of the means taken to subdue them. How we went down into cañons so steep that the horses had to sit down and slide, and how we climbed out again. How we fished the Yampa at Steamboat and got back to civilization. But all these details I spare the unfortunate reader, only urging him to go and try it all for himself.

I claim for this history the one merit that it is free from fine writing and poetry. The subject deserves them both, but is too large for any one but an essayist and a poet. If you doubt me, go and see.

A. ST. J. NEWBERRY.

CLEVELAND, O.

OREGON NOTES.

PORTLAND, Ore., Oct. 20 —There is sorrow in the FOREST AND STREAM household. One of its brightest and most beloved members has passed over to that unknown and silent shore from whence no traveler has ever returned.

Osmond O. Smith and the writer were warm personal friends for many years and that friendship had ripened into an almost brotherly love.

On two different occasions he had gone far out of his way to spend a few weeks with me, and no one can now deplore his sad ending more than myself. I had been cognizant of his serious condition almost from the first and had urged him to come to Portland, where possibly he might have better medical treatment and the unselfish care and attention of those who loved him. But Smith was a very peculiar man and preferred to bear his burdens and distresses alone. And yet he was not alone, for, as I am glad to say, since his demise I have learned that there were those near him until the end came that had learned to know him and therefore to love him.

O. O. Smith was one of the most conscientious, honorable, manly men it has ever been my good fortune to know, and as a sportsman we must all concur in the sentiment of FOREST AND STREAM'S editorial estimate of him: "He came as nearly as did any one we ever knew to the actual winning of what is best in field sportsmanship."

Years ago I knew all about the salmon and trout of the Pacific coast, in my own estimation. I was spoken of by my admiring sporting friends as "an authority" upon all such matters, and I almost felt that I was entitled to the distinction. I was always ready with an opinion backed up by quotations from all the best authorities, and particularly with copious references to the reports of the United States Fish Commission. But the boys commenced o ask me hard questions, and they seemed to derive so much satisfaction from my discomfiture that they have kept it up until I have about concluded that I don't know anything in particular, in fact, that I haven't even fair horse sense concerning these matters. First they embarrassed me with this interrogatory: "If all the various kinds of trout become salmon trout when they get into salt water and the salmon trout grow into steelheads, have we any true trout?" Then they wanted to know why it was that we caught 1lb. and 60lb. salmon out of the same pool on the same day at Willamette Falls if they all matured at two years and then returned to fresh water to spawn and consequently to die.

Now Mead is asking me to explain why it is that among the rainbow trout of exactly the same size in Waldo Lake, on top of the Cascade Range, part are white-meated and part red or pink. Will Judge Cheney kindly come to the rescue of my fast fading reputation and answer Mead's question, and oblige?

After more than a dozen years of good, honest, conscientious attention to business my poor old dog Mike has gone the way of the world.

He had become nearly blind and deaf, was a rheumatic sufferer, and a burden to himself. So his old friend Billy Newman took him out among the hills he loved so well and shot him. I couldn't. He was a good dog, and I fear that no other can ever take his place in my affections.

It does beat all how close an attachment will grow up between man and a faithful dog, to be augmented by the rolling years and cemented by death.

We have been doing a rushing business in albinos in this neck of the woods lately. Three pure white crows out of a nest of four found near Corvallis, now in a bird store here in the city and properly authenticated. Also a pure white buck and a pure white fawn, killed in southern Oregon, and now on exhibition in the show window of one of our local drug stores.

Only fair shooting is reported by our duck hunters, except at the Jewett Lake on Sauvie's Island. There the shooting has been almost phenomenal and can be traced to a generous and judicial distribution of Oregon wheat—a temptation not easily resisted by the trash ducks. But canvasbacks are no longer killed hereabouts. Last Sunday at the Jewett three sportsmen killed 190 trash ducks, of which J. R. Mead got eighty-eight shooting alone.

Old FOREST AND STREAM is unusually interesting here of late, and while every line of it is entertaining from my standpoint as an angler, it seems to me that Fred Mather's "Men I Have Fished With" is remarkably fine. Permit me to compliment Miss Elizabeth Taylor also on "Fishing in Iceland" in the last number. It was unique and most delightful.

S. H. GREENE.

ANTLER.

GRAND VIEW, Tenn., Nov. 4.—The rain clouds drifted, dark and heavy, across the headlands of the beautiful Grand Traverse Bay, when we boarded the train and sped away southward. It rained all the way to Cincinnati, where I at once proceeded to look up the circumjacent Kingfishers. I had not met them for more than three years. I hoped last summer to "hear their faithful steel clash once (or more) around the board," but the fates were against it, and I submitted as gracefully as possible.

Then I had the further pleasure of shaking hands with other good fellows, including Br'er Starbuck, Ned, Capt. Tinker and Dr. Dewey, whose consummate skill as a naturalist and taxidermist of the first order is well exemplified in the magnificent collections at the rooms of the Cuvier Club; second, as I think, to none outside the Smithsonian.

Well, the boys made me free of the Cuvier Club, and would have treated us right royally had we given them a chance; but other engagements forbade our longer stay, and we were not long in reaching the glorious old Tennessee hills (mountains, as Old Hickory says of them, if one has not climbed the Rockies).

Eventually we "hived up" alongside our mutual friend Antler, who is as fine an example of the old-time hunter as one might wish to meet.

Now, Antler is one of the most modest of men, and would scarce thank me for saying about him all the good things that come to mind. No man is more respected than is he in the community in which he lives, and notwithstanding his eighty-five years he can still descend and climb the steep and rocky sides of a 100ft. gorge without assistance, and throw a tomahawk into a tree with unerring skill.

His memory is stored with a rich and varied fund of hunting incident and story, dating back even past the time when in the "twenties" he hunted with the old Seneca chief, Tanda Jimison, and it was estimated that during the first week of our stay here he and I told each other about 16,000 stories.

Mrs. Kelpie, being asked how long since she had heard me talk so much, replied, "About forty years."

She and I, while sitting of evenings before the great stone fireplace and listening to Antler's stories, have often wished that we could have present the coterie of good fellows we met at the FOREST AND STREAM exhibit at the World's Fair, and who gathered with us around the tables at Costa Rica and Brazil. If Reynolds, and Hough, and Hofer could only step in, wouldn't we have a jollification!

Well, we hadn't even a stenographer, so that I fear that most of these precious reminiscences will be lost to the world, though I may perhaps manage to preserve a few.

This place is situated on Walden Ridge, a spur of the Cumberland Mountains. It used to be a famous locality for game, but that was long ago. Deer are rarely seen; turkeys are not very plentiful; hares and squirrels seem to be the principal game. I have seen but one bevy of quail as yet, and hope no one will shoot them. There are a very few ruffed grouse here, and why they are not plentiful no one seems to know.

My wife asked Antler if there were many snakes about, to which he replied, "No, we've hardly got enough for our own use."

KELPIE.

IN THE CASCADES.—III.

The Waldo Lake Country.

WALDO LAKE was, on first impression, something of a disappointment to Mead and me. It was not so large superficially as we had anticipated, being little more than a mile long and half as wide. But a more intimate acquaintance increased our respect for it vastly. We found it very deep—no one knows how deep—and our observations inclined us to the belief that it was longer perpendicularly than horizontally. The rugged and stupendous surroundings, too, had a tendency to make it appear smaller than it really was, as we found by drawing our hats down low over our eyes, so that we could see only the lake itself. I hardly think that it is of crater origin, although it may be. It was encircled by bare, rugged peaks except on the east, where a tiny outlet crept off, we know not whither, while another tiny stream came in from the west, from whence we know not. Between these peaks and the lake was a strip of sloping ground perhaps a couple of hundred yards wide, covered with gigantic trees. Near the head of the lake is a pretty little meadow probably five acres in extent, where the poor horses found an abundance of sweet grass. A gentleman at Albany told us that not long ago he had counted fifty-seven deer grazing there at one time, but they told us both at Albany and Detroit that the deer had left these high altitudes for the lowlands, that the bears had left for the huckleberry patches, and that elk were at all times uncertain, all of which proved only too true. On the way up and even about the lake we saw tracks of elk, cougar and bears in abundance, but we saw very little deer sign, and at the lake we found some other sign that about dispelled our hopes of getting elk. We found that a small party of Indians, presumably Warm Springs, had but recently passed that way, and elk and Indians don't neighbor much. There were the beautiful, fresh tracks of a band of fourteen elk that had passed the lower end of the lake recently, and there were the correspondingly ugly, fresh tracks of a band of five Indians that had passed over the same trail more recently. There was but one really profane man in our crowd and even he wasn't able to do the subject justice.

Of course we had no dogs and the weather had been dry so long that still-hunting was a misnomer. Even when Mears and Christy passed the lake in August it was too dry for successful still-hunting. It had continued dry and our crowd had figured on striking the lake at the September full moon. You know that all weather sharps are ready to bank on full moon storms any month of the year. And then too Mead had discovered that the autumnal equinox and the September full moon traveled hand in hand, and everybody knows all about the certainty and severity of the autumnal equinoctial storms. Just think of it! full moon Sept. 21! Is it any wonder that our party should arrive at Waldo Lake on the evening of Sept. 21? It was simply because we were more shrewd and cunning than other hunters and kept track of the moon and the autumnal equinox—another exhibition of the superiority of mind over matter. We give the snap away now, for the reason that we are not at all selfish and desire to benefit the rising generation of sportsmen, give them the benefit of our superior knowledge, observation and scientific attainments. Of course it isn't often that you can catch the full moon and the autumnal equinox exactly together as we did, but they will doubtless be near enough together for all practical purposes.

The fact that it continued as still as death and as clear as a bell all the time we were there, and still continues so at this writing (Oct. 20), proves nothing except that there are exceptions to all general rules, and Mead insists that the September full moon storm and the great autumnal equinoctial storm will both yet put in an appearance if people will only be patient and not try to hurry nature.

There could be no prettier camping place than ours right at the head of the lake where the little stream came in. The giant pines, cedars and firs grew as thick as they could conveniently stand right up to the water's edge, as they did all the way around the lake, and so, with plenty of feed for the horses, plenty of good water and plenty of game sign, we were all disposed to be very happy and forgetful of trouble and hardship, even of the P. Warmer itself.

Having been compelled to leave most of our packs on the way in, there was no great variety of eatables for supper, but we swallowed our beans, bacon and coffee without a murmur. Mention of the P. Warmer made us all feel thankful enough for even what we had.

The lake was like a sheet of glass, and the boys said they had found it in the same condition when they were there in August and that they then fished by moonlight with black flies. So we decided to wait until the full moon got up where it could look down into the lake and then try the experiment. In the meantime we set everything to rights in camp, prepared our beds and lounged around smoking and telling yarns in that easy, happy-go-lucky way, the full enjoyment of which is only appreciated by a set of congenial spirits in the mountains.

When the boys were there in August they had for guide a young fellow by the name of Jim Wright, born and raised at Molalla. He still lives there. I know him and his people well. He is a thorough mountaineer and a great talker. What he can't tell you of the past history and future prospects of the Molalla country will never bother its historion.

Molalla is noted far and wide for the numerous personal encounters that have taken place there, and its death roll from violence is a stain upon its otherwise fair name. Jim proudly rehearsed all these to the boys and among other things reviewed in detail a recent encounter wherein Billy Patterson was the hero. "Billy Patterson! Are you quite sure that it was Billy Patterson?" asked Mears and Christy in the same breath. "Oh, yes," replied Jim. "You see it was like this;" and Jim proceeded to give them the story all over again of how Billy had cleaned out the whole gang, although pretty well used up himself. "Now, Jim," said Christy, "you may not be aware that the whole world is anxious to know the name of the man that struck Billy Patterson; can you tell us positively who struck Billy Patterson?" "Of course, I can tell you," said Jim, "you see, it was like this;" and then he would tell the story over again and implicate a half dozen toughs, but he couldn't just exactly tell which one actually struck Billy Patterson. Jim told the story a great many times in his attempt to fasten upon the guilty man and thought they were all more or less guilty, but he finally settled down upon Jack Maloney as the man who actually struck Billy Patterson. "All right," said Christy, "be sworn." Jim hesitated, and preferred to affirm. "Very well," said Christy, "you, Jim Wright, do solemnly affirm that Jack Maloney was the man who struck Billy Patterson, and this you do under the pains and penalties of perjury." "What is the penalty?" inquired Jim, now on the anxious seat. "Hanging by the neck until you are dead, dead, dead, and may God have mercy on your soul!" responded Christy. Jim weakened. He was pretty sure, but didn't propose to set either his foot or his neck in it for a doubtful notoriety, and so the world may never know positively who the man was that actually struck Billy Patterson. Jim is a conscientious boy, and for my part I think it was Jack Maloney.

By 9 o'clock the moon was on the lake. It was an entrancing sight. The lake looked like a sheet of molten gold fringed with emeralds and set among gigantic uncut stones—a fair and radiant jewel in sweet nature's imperishable casket. We had watched the lunar gilding of the jagged peaks from the rising of the moon; had seen it gradually—almost imperceptibly—melt along down the rugged walls and spread its spectral light out over the narrow valley, and doubtless every man of us appreciated the novelty of our environments and the beauty and romance of the occasion. It seemed as if nature was trying to entertain us with an unusual exhibition of gentle and pleasing effects, but we could not forget that, possibly, for thousands of years nature had thus silently and serenely amused herself in these solitutes and blushed unseen of mortal eyes, as the modest maiden toys with her charms and blushes at her own lonely loveliness in the reflecting glass. Oh, ephemeral man! how prone you are to appropriate nature's beauties and bounties as creations for your especial happiness and edification; forgetful of the fact that they were when you were not, and that they will be when you are mouldering, insensate dust!

Out upon the placid lake we stole in pairs, appropriating the log rafts which previous anglers, possibly Warm Springs, had conveniently left at our service. And never in our lives had we enjoyed finer sport with the finny denizens than we found that night on the silent waters of moonlit, spectral Waldo Lake. It was delightfully entrancing, such as I imagine the true angler sees when he dreams that he is dead and fishing over on the other side. I have fished for nearly forty years, but never before had I fully realized or appreciated the delights of ghost fishing.

We used dark flies. My string was made up of black gnat, black hackle and the Mead. The Mead, of course, is a light fly, but I desired to experiment a little, and while ordinarily the Mead is a very taking fly, the trout of Waldo Lake seemed to prefer black flies by moonlight.

They were all rainbow trout and run from 8 to 18 in., very gamy and fine. An hour and a half filled our baskets to overflowing, and we went to camp well satisfied with the prospects so far as trout were concerned.

PORTLAND, Ore.

[TO BE CONTINUED.]

O. O. S.

Wife and daughter had gone on a visit, the house was empty and silent—save for the ticking of the clock—when I unfolded the FOREST AND STREAM of Oct. 3, preparatory to enjoying my treat alone and without a fear of interruption.

Turning quickly to see who among the "Men I have Fished With" was to be my companion for the day, my eye fell upon the inimitable sketch of Geo. Raynor. From the tragedy of his introduction into the great world beyond his childhood home, I followed on with bated breath along the story of his sad life's journey, through all the record of his unfailing courtesy and patient heroism, and when the final leave was taken of the dear old gentleman, and he was left to the

"Calm for those who weep,
The rest for weary pilgrims found,"

I was glad indeed that no one was present to note critically whether my eyes were wet or not.

This is a story to cause one to think better of his kind, and to prompt him to resume his load and the journey of life more uncomplainingly. And how shall we thank this modern wizard who weaves so potent a spell? Name a bicycle club for him? Certainly. And count me a member, though I never mounted a bicycle.

And then came, like a bolt from a clear sky, the word of the passing of O. O. S. I had hardly the heart to break the news to my wife and daughters, to whom he had, a few weeks previously, sent a collection of the most beautiful sea mosses I ever saw, mounted on cardboard. Need I say how, henceforth, they will be prized in our home?

I had for a number of years been in occasional correspondence with him, and had learned to regard him as one of the truest members of the great FOREST AND STREAM family. We had begun to wonder at not hearing from him for some weeks, when all so unexpectedly the sad news came.

"For what is your life? It is even a vapor which appeareth for a little time and then vanisheth away!"

ORIN BELKNAP.

Two Deer Apiece.

BROOKLYN, N. Y., Oct. 26.—*Editor Forest and Stream:* I returned last Tuesday from two weeks spent with Jock Darling at Saboois Grand Lake, and found Darling, although a sick man, a genial host during the time we spent at the home camp. After three days of bad weather we left the home camp, and taking tents, spent the balance of our time, on the 3d, at Grand Lake. We (Mr. E. D. Hall and myself) got what deer the law allows, but no moose or caribou, although signs were plenty and fresh. I saw some moose, but failed to get a shot at a bull.

Altogether I consider my first experience in Maine an entire success, though I did not get the coveted moose horns. Our guides, good fellows both, were courteous, skillful and indefatigable. In fact, hotel proprietors, teamsters and every one with whom we came in contact were of a very different stamp from men I have met with on some of my hunting trips in the West and in our own State.

PAUL E. BONNER.

The FOREST AND STREAM *is put to press each week on Tuesday Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.*

Natural History.

LIVING MASTODONS OF ALASKA.

MINERS and Stick Indians who have come out this fall from the headwaters of the White River, in Alaska, where they have been prospecting for gold, bring almost conclusive evidence of the presence of living mastodons in that isolated region. For instance, the testimony of such veracious witnesses as those residents of Denver, Colo., who were interviewed as recently as Oct. 15 by editor Eugene C. Stahl, of the Juneau *News*, himself a conscientious naturalist of no mean abilities, is not to be flippantly disregarded; nor the collateral testimony, which is more than circumstantial, furnished by traders and intelligent Indians who profess to have seen the animals and their massive footprints. These Indians, who are indomitable hunters, have been stimulated of late by the demands for fresh meat by the 1,000 miners, who are now working the Yukon tributaries, to pursue their quests for game into isolated and inaccessible regions hitherto unknown to man, and until this year repeated attempts of prospectors to penetrate the country have failed.

The location of the Mastodon country, according to the sketch map of Wm. Ogilvie, of the Dominion Survey, is about midway between Mt. St. Elias and the Yukon River, and 100 miles due north from St. Elias, and less than that from old Fort Selkirk and the mouth of Stewart River and Forty Mile Creek, where hundreds of gold miners have been prospecting for ten years or more. The White River is an affluent of the Yukon, whose course is due north. That it should never have been visited is not remarkable, unless the trappers and wood-runners of the old Russian-American Fur Co. may by possible chance have gotten there in years gone by, and that mastodons may have chosen this inaccessible seclusion as their final stamping ground and still survive is also not improbable. Indeed, their actual living existence at the present day is essentially necessary to explain the phenomena of the numerous buried deposits of remains of this animal which have been discovered in Siberia and Alaska, not only of bones and tusks which Eskimos have made articles of barter for generations, but of well-preserved carcasses so fresh that the sled dogs of overland Arctic explorers have repeatedly been fed upon the flesh—carcasses which were supposed to have lain refrigerated and undecayed for centuries, but which it is more reasonable to believe, under the new testimony and revelation on the White River, have been buried within a comparatively recent period of historical time. Washouts along the deltas of the Lena, Mackenzie and other Arctic rivers are constantly revealing masses of mastodon tusks and bones; and deposits are often found in just such bogs as overlay the country adjacent to the White River headwaters, where the animals have been drowned and mired by hundreds by some flood or cataclysm which has overwhelmed them. On the heights of land which separate the tributaries of the Yukon from the affluents of the Pacific Ocean they would be quite exempt from such a catastrophe; and as they have moss, grass, browse and fodder in unlimited supply in their present habitat, and a temperature cold enough to suit and plenty of water to drink, credulous scientists will be ready to believe, from the evidence adduced, that a remnant of this huge creature, long supposed to be extinct, still exists within possible access of human habitations and a resident population of at least 1,000 miners, traders and furriers.

These are not empty fabrications or frivolous suppositions, forsooth, because the Stick Indians, who are the most wide-awake and intelligent aborigines on the border of British Columbia, have averred that not later than five years ago such animals had been seen by them. One of the Indians said that while hunting one day in that unknown section he came across an immense track, sunk to a depth of several inches in the moss, which was larger around than a barrel. Upon striking it he followed up the unusual trail, which to all appearance was very fresh, and tracking it from one gigantic stride to another for a distance of some miles, he came in full view of his game! And what game! In dismay the hunter gave one single look, and then fled as if pursued by the evil one.

Now the Stick Indians as a class are the bravest of their race, and with no other weapon than a spear have been known to attack and slay the St. Elias grizzly. But the immense proportions of this new kind of game, as told by the adventurer himself to one of the Denver prospectors already referred to, both startled the hunter and filled him with great fear, brave as he was, and he imagined that his only safety lay in swift and immediate flight. He described it as being larger than Harper's, the post trader's, store near Forty-Mile Creek (Harper & McQuestions), with great, shining, yellowish tusks, and a mouth large enough to swallow him at a gulp. He said the animal was undoubtedly the same as were the huge bones scattered all over that section. Mr. Harper says there is no reason to doubt the narrator's veracity, and he himself confirms the statement. Manifestly the whole Yukon country was inhabited by these animals at a very recent period. Hundreds of their massive skeletons are found along the creeks, projecting partly from the sands and mingled with jams of floodwood, with which they were no doubt simultaneously engulfed when the flood came. Below Forty-Mile Creek the skeletons are very numerous. Hundreds of tons of tusks have been carried from Alaska to Siberia by the Eskimos in the course of trade, and the deposits are by no means exhausted. The intense cold freezes the banks solid, and renders their exhumation a tedious task.

CHARLES HALLOCK,
Member of the Alaska Historical Society, and author of "Our New Alaska."

American Ornithologists' Union.

THE fourteenth congress of the American Ornithologists' Union convened in Cambridge, Mass., on Tuesday, Nov. 10. The reading of papers formed a prominent feature of the meetings. We shall have a report of the meetings next week.

Game Laws in Brief.

THE *Game Laws in Brief*, current edition, sold everywhere, has new game and fish laws for more than thirty of the States. It covers the entire country, is carefully prepared, and gives all that shooters and anglers require. See advertisement.

Game Bag and Gun.

Our readers are invited to send us for these columns notes of the game supply, shooting resorts, and their experience in the field.

WATER KILLING DEER.

Editor Forest and Stream:

In the issue of this week my eye reverts again and again to Deerslayer's article under the caption of "Defends Deer Roping." At each returning glare the aforesaid optic grows wilder and more inflamed, for this communication is like the red flag to the bull to me, and must be so to thousands of my fellow readers of FOREST AND STREAM.

It is refreshing to learn from Deerslayer something of the true standard of gentlemanly sport in the effete East, where we are told that enlightenment and the ethics of sportsmanship are advancing in an exact ratio with the decrease of game.

We of the Middle and Western States are to be congratulated that our game supply is still so plentiful that we can afford to give the deer a fair chance for his life in the open, and we do not require our victims to be driven into ponds by hounds nor led up to us on the end of a string in order to be shot. Deerslayer assures us that "it is great sport and no error." If this be so he cannot have told us all; he should have dilated upon the invigorating excitement of the tyro who has never hunted in this way before. He could make another story of the mental strain undergone during buck fever. He makes it clear that after the exhausted deer has been roped and drawn up to within a reasonable shooting distance (in the case of Deerslayer I should think 6ft. would be about right), then "the good old 10 gauge" in the hands of "a man who is cool-headed and a fair shot" is sure to kill. Why, his "own boy, who is a chip of the old block, and only twelve years old, killed his deer the first time he went out." Now, I haven't any chip of the old block, but if I had, and if under similar circumstances he couldn't kill his deer the first time, I would disinherit him, but—I'd disinherit him if he did.

Ours is a new country and we have much to learn from the East. When we find dogs running deer in our woods we shoot the dogs. If killing 5,000 deer every season will increase the supply, we can let the dogs alone and bend our energies toward the deer. And further, to be consistent, when we have any feelings in this matter which we wish to express in public we will do so over a *nom de plume* of Deerslayer or Deer Butcher, or some equally euphonious synonym. FRANK CONGER BALDWIN.

MICHIGAN.

Editor Forest and Stream:

"The man who is cool-headed and a fair shot is sure to kill the game." So says one of our "big game hunters" in your last issue, who tells us of his manner of killing deer—by roping and killing with a charge of buckshot. Need a man necessarily be a "fair shot" to murder a roped deer at a distance of a few yards? If this article in FOREST AND STREAM is perused by some of the "lawmakers at Albany" there will be some more laws to restrict such cold-blooded murders.

How a man can call this "sport" is beyond my comprehension. If you do not receive a good many letters condemning such practices I shall be very much mistaken. Bird hunting has no fascination for this man, for the reason, no doubt, that wing-shooting is too difficult, and the pleasure experienced in knocking down an old cock grouse is unknown to him.

He wants a "fair chance," but what kind of a chance has the deer got? None whatever.

Such men ought to run a slaughter house and kill cattle, as there is just as much pleasure in that as in killing a tethered deer. W. N. TAYLOR.

MAINE.

Editor Forest and Stream:

As a general thing I don't approve of a cross-fire argument unless carried on in a proper spirit, but once in a while somebody will advance ideas which, while they may keep within the game laws, are wholly at variance with the laws of humanity. This, I think, is the case in the article by Deerslayer in your last issue. The methods of killing deer described by him are lawful (in some States), but there is a difference between butchery and sport. My boast is not how many deer I have killed, but how few. Those I still-hunted. I despise hounds, jacks and butchery, and will somebody with the same views answer Deerslayer as he should be answered? I can't put it strong enough. W. L. SKINNER.

MASSACHUSETTS.

Editor Forest and Stream:

I have been a reader of FOREST AND STREAM for nearly twenty years, and for many years have hunted every fall and have killed game, large and small, and thought I was qualified by years of experience to set myself up as a sportsman; but Deerslayer's article knocks the wind all out of my sails, and I find I must begin all over again in order to kill my deer in a "scientific way and with the best of appliances." Now, I learned years ago from Nessmuk and the other grand old sportsmen whom the old readers of FOREST AND STREAM are familiar with, that the best way to kill a deer was to still-hunt them without dogs, or watch for them on runways when hunted with dogs, and shoot them with a rifle. There is nothing I like better than being up to date, so I am always on the lookout for ways and means to improve myself. Being a mechanic, I find it necessary to be up with the times in doing my work, and I know of no reason why we should not avail ourselves of modern ways and ideas when the time comes to take our trip into the woods after deer. I have thought as I read the aforesaid article over and over that if the deer could only understand that they were going to be killed with "the best of appliances" it might be that they would not act so blamed wild and make such long jumps as they cross my runway. Then again, being a mechanic, the matter of dollars and cents enters largely into all my plans for deer hunting, and I discover that if I hunt my deer by this new and "scientific" way I may have more money in my pocket and stay longer in the woods, as I have owned for many years a shotgun, and for the "scientific" killing of deer a shotgun is necessary and not the new Marlin which I purchased this fall. And if one wished to economize still further he might leave out the shotgun and buy a good knife for $1, and after the "experienced guide" had overtaken the straining buck and secured him with a twitch-up he could cut his throat, and still the supply of venison would be sure.

Deerslayer says he does not care for bird hunting. I suppose the reason is, he has not been trained to hunt them in a scientific way If he will purchase the September number of *Scribner's* he will find an article on moose hunting; and one of the illustrations is that of a man with a fish pole, on the end of which is a noose; on a tree sits a partridge, and the "scientific" bird hunter slips the noose over the head of the bird, gives a yank, and the supply of birds is sure. I simply put this in, thinking that if Deerslayer would only hunt his birds in a scientific way he might come to enjoy the sport.

Fancy shooters are able to kill their deer with a rifle ball put where it will do the most good, and having got used to that way, and having provided myself with such an old-fashioned weapon as a 38 55 Marlin, I shall continue to follow the teachings of Nessmuk and others of that stripe. But as for the young hunter who has yet to kill his first deer, I wish to assure him that for a successful deer hunt, conducted in a scientific manner, that combination of strong and "experienced guides," "forked sapling," "bit of rope," and "10-gauge shotgun and buckshot" is hard to beat when the object is to make the supply of venison sure; and if I had a boy of twelve years who under such circumstances could not kill that deer I would have him study for a dressmaker. BULLETS.

MECHANICSVILLE, N. Y.

Editor Forest and Stream:

In an issue of FOREST AND STREAM of October last I noticed an article alluding to deer roping as "sport." What conception can Deerslayer have as to the meaning of that word? To rope a deer in the water from a boat is most brutal, if indulged in short of actual necessity. There is no sport where the animal has no chance for its life; it is natural for the deer to seek safety in the water when hounded and it would be a poor oarsman that could not catch a deer with a boat, and a poor man that could not kill it at a short rope's end by means of a 10-bore double gun. If Deerslayer thinks it sport, why, there is an opportunity for plenty of sport of like nature that could be had at the Union Stock Yards of Chicago, could he get an engagement there. He would have in lieu of the lake the vast slaughtering pens; in place of the boat the plank walk over the stalls and pens; to remind him of the unsteadiness of a boat would be the planks, just wide enough to walk with ease; the 10-bore gun would give place to a stone sledge with which to hit them on the head; the rope, though used, would not be required in the narrow pen, though the actual work would have been accomplished by the "guides" (the boys on the plains). In place of hounds to drive he would have men to drive the "deer" (cattle) into the pens as fast as he could kill, and would that not be sport in his mind?

CLARENCE BARCLAY WARD.

LONG ISLAND.

Editor Forest and Stream:

My spirit has been refreshed and my soul uplifted by Deerslayer's letter in your issue for Oct. 31. From my boyhood up I have been a great admirer of Deerslayer. I met him in the pages of Fenimore Cooper, and at once knew him for a friend and brother; a sportsman who killed only so much game as he needed, and whose voice, even away back in the last century, was raised against the wanton killing which he saw going on all about him. You can imagine, therefore, the pleasure with which I discovered that my old friend was still living and still roaming the familiar woods. To be sure, Deerslayer's sentiments, as advanced in his letter, are not quite what I had expected from Cooper's hero, but surely some consideration is due to age and infirmity

Deerslayer doubtless is right. A "strong effort will be made to enact more laws to restrict the sport of deer shooting in the Adirondacks by prohibiting jacking and hounding." "Such things are always urged by a lot of fancy shooters with their high-toned ideas of still-hunting and wing-shooting," and "not by real old-fashioned hunters who go out for game and want a fair chance to get it."

No one can doubt for a moment that Deerslayer is a "real old-fashioned hunter" His letter shows that he "goes out for game" and wants a chance to get it. Who would have the heart to deny him that right? I may seem radical, but I go even further than Deerslayer. I would have the laws materially modified for the benefit of the "real old-fashioned hunter" and his friends, and I believe that the true sportsmen are with me.

Picture to yourself what these fancy shooters would do. They would take away poor old Deerslayer's "10 gauge shotgun loaded with buckshot," and give him a rifle. They would compel him to still-hunt his deer in the woods—compel him, perhaps, to walk several rods where there are no macadamized roads, no beer saloons, not even electric lights; compel him—but I will not pursue the subject. It is painful.

The pathetic thing about it is that Deerslayer, in his old-fashioned, honest simplicity, seems satisfied with the present laws. He seems to think that his rights are protected now, and he fails to see the difficulties by which he is surrounded. He says that when the guide has slipped a noose over the head of the swimming deer the sportsman "with the 10-gauge shotgun loaded with buckshot makes the supply of venison sure," and that "if he is cool-headed and a fair shot he is sure to kill the game." The dear old man seems not to know that all men are not, like himself, cool-headed and fair shots.

Now, certain slight changes in the game laws in the direction of greater license would undoubtedly be of distinct benefit to Deerslayer and the other old-fashioned hunters, whose rights ought not to be overlooked. The modifications I would suggest are these:

First—That all the deer be caught and painted with luminous white paint, so that they may be equally conspicuous by day or night.

Second—That a large cow bell be attached to each deer, so that his presence may be made known even before he comes in sight.

Third—That a conspicuous bullseye with concentric rings be painted on the side of each deer behind the shoulder, so that Deerslayer and other old-fashioned hunters may tell at a glance where to strike.

Fourth—That the deer be inclosed by barbed wire fences in small patches of woods near the camp.

Fifth—That when the hunters are ready the woods be set on fire, and Deerslayer and his friends furnished with axes. They can then stroll quietly up to the deer and have thrilling and healthful sport, with the risk of losing the game reduced to a minimum.

Sixth—That when other game grows scarce Deerslayer be allowed to take his old grandmother, or any other person unable by reason of age or infirmity to resist, chain her to a post, saturate her clothes with kerosene, set her on fire and then whang her with a crow bar. If he "have a cool head and take fair aim" she cannot escape.

Finally—That the State of New York offer a bounty of $1 000 on Deerslayer and all the "old-fashioned hunters" of his party, with no close time.

These few simple changes in the game laws, Mr. Editor, would doubtless afford our old friend Deerslayer much satisfaction, and the last one I have proposed would greatly please all the rest of us.

EDWARD WILLISTON FRENTZ.

BOSTON, MASS.

Editor Forest and Stream:

I have been a reader of FOREST AND STREAM for a number of years and have never written anything for its columns, but I must have something to say in reply to Deerslayer's defense of deer roping. I sincerely hope the time is near when every State in our glorious Union where the noble deer ranges will see the necessity and wisdom of prohibiting all hounding and jacking, and put a heavy penalty in the statutes for the benefit of those who persist in following deer with dogs and killing them after they have taken to the water for safety. No hunter, be he old-fashioned or otherwise, in this learned and enlightened country would be guilty of such work, and I hope Deerslayer is not sincere in what he writes, but does so simply for the sake of argument. I cannot see where any science is brought into use in sitting around and waiting until the game is driven into the water, and, worst of all, literally tied up to wait the pleasure of the butcher. It is nothing more nor less than butchery, and how any man can become a participant in such an unsportsmanlike act is a mystery to me.

Now, Deerslayer, let me offer you a piece of advice: When you visit your preserve again, lay aside your shotgun; if not already in possession of a good, reliable rifle, purchase one; and if you understand still-hunting, go alone; if not, get the services of a guide who can still-hunt and trail deer. Take to the woods. Match your skill and cunning against that of your game. You may not get sight of your quarry so soon nor with as little fatigue; but, let me assure you, when you do look through the sights of the genuine deer hunter's weapon, the rifle, and when its report sounds the death knell of a noble buck, and you stand over him with the knowledge that his chances of escape were equal to yours of securing him, it is a moment that will bring to you the supreme joy of your life. I for one cannot agree with you that there is no pleasure in deer hunting except with the jack light or hounds. W. R. CLINE.

ILLINOIS.

Editor Forest and Stream:

The leading article on the editorial page of last issue of FOREST AND STREAM was somewhat of a surprise to me, inasmuch as I learned thereby that the contribution in a recent issue of your paper signed Deerslayer was anything other than the product of some sarcastic sportsman inclined to write in a jocular vein.

The statement that "a cool head, a 10-gauge gun and a good load of buckshot" are requisites to kill a roped deer at a 5ft. range is quite humorous, to say the least. It strikes me that Deerslayer, if an adept in the business of water killing, ought not to have entirely ignored the glittering axe and the festive club, and let us hope that the twelve-year-old "chip of the old block" will not neglect the use of these handy weapons when he reaches the age of discretion, since much valuable ammunition may be saved thereby. If the party who signs himself Deerslayer really means what he says in his communication to FOREST AND STREAM, he can without doubt secure a steady job and good wages by applying at any abattoir in need of the services of a first-class butcher, one who is frank enough to let the world know that he is not above his calling. I did, however, and do still believe that Deerslayer is merely a candidate for a place on a funny paper, and trust that my view of the case may be a correct one and that the pages of your excellent paper have not been defiled by the real sentiments of any such a creature as the article in question would indicate its author to be. S.

TROY, N. Y.

Editor Forest and Stream:

So the New York *Mail and Express* took Deerslayer seriously. I was going to do so too, but after reading the article over the second time I said "Pshaw! There is no human being could have your sentiments," and I concluded it was a little sarcasm sent FOREST AND STREAM to stir up activity in favor of abolishing hounding. Really, do you want us to believe that a man wrote that article and that he wished his son to follow in his footsteps? I have heard of sportsmen who have hired guides to paddle them up to within a few yards of a deer swimming in the water to be shot at with a rifle, and I know of many cases of boasted moose hunting by calling and then shooting at the big fellow, who does not know enough to run when hit. I have heard of your ex-president out jacking and of other folks crusting, hounding in deep snow and all other questionable methods, but for supreme brutality this man Deerslayer takes the lead. Oh! Mr. Deerslayer, let us have your real name, that it may be emblazoned on the pages of the history of brave men. Ugh! Have your guide noose a deer in the water and hold him while you place your 10-bore shotgun at his head and fire slugs into him. Ugh!

I am glad to inform you that in Ontario we have laws that prevent all shooting in the water, jacking, etc., and we hope to do away with the dogs next year. There is a license fee of $25 asked of foreigners who hunt, and I am sure it was caused by our being imposed upon for so long by a class of which Deerslayer is supreme grand master.

ONTARIO. F. E. GALBRAITH.

MILITARY RIFLES AS BIG GAME GUNS.

ST. PAUL, Minn.—*Editor Forest and Stream:* The introduction of the long-range military rifle into use as a hunting rifle—a purpose for which it was never intended—has added a serious menace to life and limb in such sections of country as are both hunting grounds and the abode of man whenever the long-range military rifles are used therein. When used as a hunting rifle it is not only a deadly danger to all hunters within the great circle of its range, but to all others whose business or pleasure takes them into the highways and byways of the woods and fields, and to those also who may be following their peaceful vocations of life anywhere within the deer region, or even within three or four miles of it. And bear in mind that the deer region is not necessarily in the wilderness. It may be in a settled community. Deer may be and often are killed within short rifle shot of houses, and such is the great power of the military rifle that its bullet will pierce a tree or a house, so that against it the ordinary safeguards avail nothing. It will pierce about 50in. of pine.

In Wisconsin, Minnesota and Michigan earnest protests have been made against its use on the ground of its terrifying power and great danger; while others, more passive, say that they will remain at home, foregoing their big game hunting, rather than run the risk of death or wounds where the military rifle is used. Of these it is said that many are old hunters, men who valued their vacation for the pleasure it afforded them; for the relaxation from business and the recreation to be found in the great woods where roam the big game, but who, knowing the dangers to be run where the military rifle is used—dangers put therein by their fellow men—decline to take the chances. And it is a real danger, not an imaginary one.

The military rifle, having a range of about three miles in every direction from the shooter, which is the radius of a circle of about six miles in diameter, commands an area of about twenty-eight square miles—surely a most startling danger scope all centering about one man; and if we multiply this by hundreds of others (as we may readily do, the weapons being alluring and exceedingly cheap, and therefore within the means of all hunters), the danger area would be many times multiplied, and as the hunters would be constantly on the move the danger area would be constantly shifting as the hunters moved about, and would necessarily include many dwellings, schoolhouses, towns and people.

But it may be retorted that the shooting of deer is done in the woods; that the trees would stop the bullets before they could go far, thus preventing them from reaching the extreme ranges, and the trees being so numerous would act as a constant safeguard to the people.

By way of rejoinder it may be said that the trees are no more numerous than are the spaces between them, and the spaces are much greater in magnitude than are the trees. Any one in the woods can see long distances between the trees, the view never appearing as a mass of wall, and the bullets will pierce where the eye cannot. Even if the bullet at last strikes a tree, such is its power that it may pierce it and even then go on a long distance in its flight.

But deer are not always shot in woods. Many a deer has been shot in places where the woods have been cut away and a second growth of tender trees have started. Shots are fired at deer from within the edge of woods toward the open fields when opportunity offers, or on the margin of lakes, and again the rifle may be fired at a deer as it skips nimbly over a hill; and if the shooter shoots from a hollow his bullet may go soaring over the hill and tree tops and strike miles away from the firing point.

Nor is this objection against such weapons without good and sound precedent. The firing of all firearms, even those of the extremely short range, as pistols, is strictly prohibited by law in all corporate communities, for the reason that such firing endangers the life and limb, and disturbs the peace of mind, of the members of the community. Now consider that the long-range weapon, commanding such a vast area of the country, is a deadly menace to the dwellers in the country, and disturbs their peace of mind and threatens their safety, and you will have a case in which the precedents fit like a glove to the hand, waiving for the moment the common sense of the matter, the fundamental principle of self-preservation and peaceful enjoyment. The long-range weapon used in the country is more of a deadly menace than is the short-range weapon of the city, the latter being prohibited therein, and therefore is harmless.

I write in opposition to the use of the military rifle as a hunting rifle because it is an improper rifle to use on big game, since, having a flat trajectory of about 800yds., and a range of about three miles, it shoots much further than any hunter could see a deer; and seeing a deer, no hunter would shoot so far as he could see it; yet the people in all the superfluous distance it flies through are in danger from it.

Its long range is particularly unnecessary when it is considered that the average ranges at which deer are killed are from 50 to 150yds., and that there are numbers of other rifles of approved makes, styles, sizes and calibers, all sufficiently deadly and fit for the purpose, and so proved by years of trial. Indeed, many of these rifles have an unnecessary long range and are therefore a danger to a community too, but so weakly so when compared with the military rifle that the danger from them sinks into insignificance. These rifles, moreover, are too deadly—in fact, when it is considered that no more deer should be killed than what is the surplus not needed for breeding, and with the rifles already used and approved, there is danger that the needed numbers of deer will not be maintained. Therefore, whether the matter is considered from the standpoint of the sportsman or that of the market shooter, the exceedingly long range of the military rifle in deer hunting is unnecessary.

Now as to sportsmanship, let us understand first of all that these small caliber military rifles are designed for military purposes, to wound or kill men far away or near by. No consideration of sportsmanship enters into their design, purpose or use, as originally contemplated. To kill or wound an enemy by design or by accident is the purpose of the gun, and the longer the range and the flatter the trajectory the better the purpose is served; for it is self-evident that a bullet going several miles through the enemy's country will command a greater field and do more damage than will one whose range is measured by yards.

But it also has been demonstrated that the killing powers of their bullets are not instantaneous enough for sporting purposes. The high velocity and small caliber do not communicate the necessary shock to kill or bring down the game, so that much of it will escape sorely wounded, to die a lingering and painful death, or fall a prey to ravenous wolves. Aside from the cruelty of it, no sportsman would use a weapon which disturbed the peace of mind or safety of a neighborhood or of his fellows by creating fears of bodily harm or loss of life. A true sportsman would not take pleasure in a sport which caused fears of loss of life or maiming to others, or which endangered life if the danger was unknown to anyone but himself.

No doubt but what the novelty of the gun and its long range are the qualities which attract so many, rather than its fitness for practical work. It serves to excite wonder amongst those who have not seen it, and the owner gains a distinction by the ownership and parade of it which he might never have as a hunter.

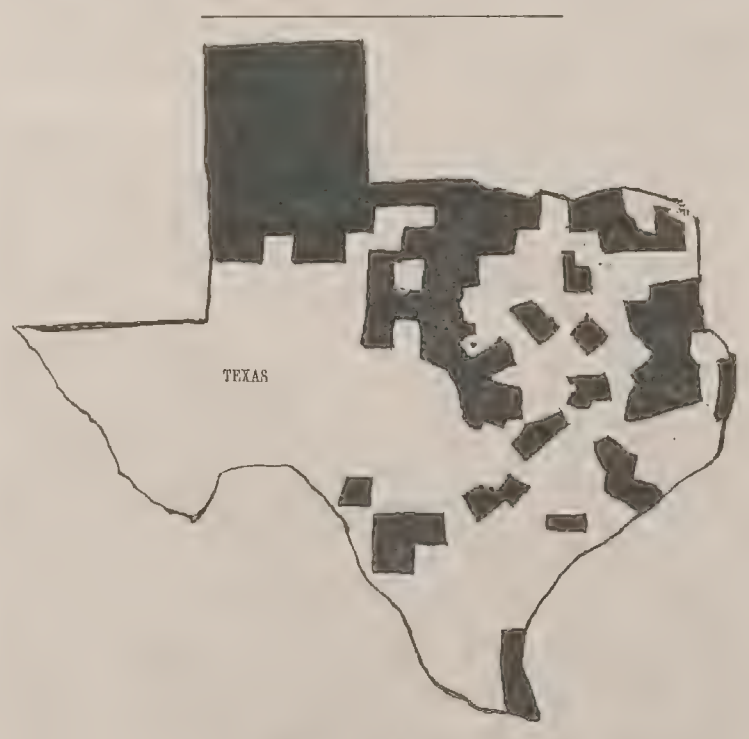
Again, there are many who are thoughtless, and take for granted that a gun which will shoot further than any other gun is the gun for all purposes.

Even with the best of care, lamentable accidents are constantly happening from the use of firearms; and it seems like tempting fate to make a departure which has in it so much of jeopardy to the lives and limbs of others, without the shadow of reason or necessity to justify it.

The annual report of Gen. Flagler, Chief of Ordnance of the United States, criticises adversely the stopping power of the .236 and .303cals. of the navy and army rifles, a matter of much more consideration to the hunter than it is to the soldier, since the purpose of the hunter is to secure absolute possession, while that of the soldier is to put his enemy out of the fight, a very severe wound serving the purpose quite as well as one that is fatal. The report mentions that the small caliber and high velocity of the new bullets do much less damage than the old .45 bullets. When the small-caliber bullet hits a man, so great is the velocity that it makes a clean round hole, imparting no shock, and even bones are drilled as if bored with a gimlet, instead of being smashed, as the older and larger calibers acted, with of course a greater corresponding shock and stopping power. The report further mentions that medical men have demonstrated that small bullets, regardless of velocity, are not so effective as the larger ones.

The attempt to secure the effects of the larger bullets by using a soft pointed small-caliber bullet, so that it would mushroom when it struck an object, proved unsatisfactory, since accuracy was impaired. And as to accuracy, when the new guns were first put in the hands of the troops they did inferior work with them and questioned their accuracy, for while they would shoot accurately a few times, there were wild shots betimes.

Now, as the stopping power of a rifle is a vital consideration in its purpose and use on live game, and as the highest authorities in the army admit its lack of stopping power, and as in actual use on big game many writers who have tried it complain of its inferiority in this respect, it is no doubt very weak in the very feature that it should be strong in, that is, stopping power.



It is yet unsatisfactorily tried in all the other conditions to which rifles are subjected—high and low temperatures; wear and tear from use, the hard metal jacket being very destructive to the rifling; economy of expense, etc., so that any claims for its excellence are more speculative than real.

To sum up, the military rifle is an unfit weapon for big game shooting in an inhabited country, since it endangers the lives of people in the country in which it is used.

It is an unsportsmanlike weapon, since it wounds much game without killing it and therefore inflicts a lasting loss and cruelty; and, more important yet, it destroys the peace of mind of a neighborhood and deters sportsmen from hunting in a country in which such dangerous guns are used.

Lastly, it is not necessary to use it at all, as there are many kinds of rifles already perfected which are much more effective and far less dangerous to the community. The gratification of the individual is as nothing compared to the safety of the community. A single life is of far more importance than the pleasure of all the hunters in the land, and the peace of mind of a community far transcends the importance of any man's pleasure.

That accidents do occur with deplorable frequency with the less powerful guns of shorter range, even when used with the greatest care, we all know, and it is a certainty that guns with such extreme ranges as the military rifle will when shot recklessly add greatly and needlessly to the death list if their use is tolerated. .44.

Two Stays.

FOREST AND STREAM is my "mainstay," and taken in connection with my "stay in Maine" manages to pull me through the year. C. H. A.

CHICAGO AND THE WEST.

Down in Arkansaw.

CHICAGO, Nov. 6.—Mr. Joseph Irwin, of Little Rock, Ark., advises me that bass fishing is very good in the "old river," near the mouth of Scott's Bayou. Messrs. Bateman Bros. and Alvin Johnson took seventy-five bass Oct. 31, and Mr. King and his party, all of Little Rock, fished there three days, using spoons and live bait, and had very good luck indeed. Mr. Irwin says:

"Quail shooting has been limited owing to the warm prevailing weather, and few large bags have been made. The ducks are here in limited numbers, but only a few have been bagged so far.

"Large numbers of deer came into market three weeks ago during a cold snap—mostly yearlings, however.

"I expect Harvey McMurchy here this month some time. Nancy, the old pointer, is still able to do good work on quail. I have an English setter in training that I expect great things from."

Game Law Matters.

The members of the Illinois State Sportsmen's Association have never for years been satisfied with the statutes covering fish and game protection in this State. The disgusting fiasco over the Blow bill is still fresh in the mind of the public, and it is the intention of the sportsmen to make further effort in the way of legislation of the proper kind. The secretary of the Association, Mr. F. R. Bissel, is sending out the following circular to the members of the clubs composing the Association:

"It is the intention of the Illinois State Sportsmen's Association to present at the next meeting of the State Legislature a fair and equitable game bill, one which will commend itself to all who desire to see the game, game birds and fish protected from extermination—a point not very far distant under present conditions.

"Every true sportsman should co-operate with us in our efforts, and we beg to ask if you will appoint a committee of say three members from your club and have them interview your Member of the Legislature, whoever he may be, and bring such influence as they may be able to aid in insuring the passage of the bill.

"This bill will soon be drafted by our law committee, and we will endeavor to have a copy sent you for your perusal and approval."

Meantime we are to have a change of governors and possibly a change of wardens in the State of Illinois. So far as the condition of the game of the State is concerned, no change could exist which would not be for the better, for there has been no intelligent conservation of the game of this State for the past ten years.

The short season for deer in Wisconsin has now been ended for nearly a week, but I hear that hunting is still going on in parts of the State in spite of the fact that the legal season is closed. It is too often the case that the so-called sportsman gives himself the benefits of all the doubts, and there are a few of these persons who construed the trouble in the Wisconsin law to mean that they should go out as early in October as they heard of the change in date, and hunt as late in November as was allowed by the old and invalid law. I hear that there will be an attempt made at the next session of the Wisconsin Legislature to establish a license law.

Speaking of license laws brings up for attention the stringent measure recently passed in Louisiana which bars the parish of Caddo absolutely to non-resident hunters. It is thought by some residents of that parish that the police jury of Caddo Parish had in passing this law some animus against the Shreveport Rod and Gun Club, and there are some discrepancies pointed out in the law, which it is claimed is passed for reasons other than those of rigid sportmanship. For instance, it is pointed out that in eighteen States of the Union the hounding of deer is prohibited, whereas it is left wide open in Caddo Parish. The more interesting points of the law are Section 7, which reads: "It shall be unlawful for non-residents to hunt within the limits of the parish of Caddo, or to carry out of the limits of said parish any game for sale or otherwise after same has been killed;" and paragraph 3 of Section 5, which states "that it shall be unlawful in the hunting of ducks, geese, brant, swan or any other wild water fowl, to use as decoys any live ducks or live geese, or artificial decoys made of canvas, rubber, wood, cork or any other material."

The startling decrease in the game supply of the country must be keenly felt indeed when such startling measures as the above come from the hospitable South.

Small-Bore Rifles.

Sportsmen have been much interested in the question of the utility as sporting weapons of the modern small-bore smokeless rifles, and there has been the most interesting diversity of opinions in regard to the merits of these arms. Some say that the .30cal. is the most deadly and destructive weapon on game ever devised, and others say they would not have it as a gift. This week I have two reports from Chicago hunters in regard to the effect of these weapons. Mr. E. C. Carter, assistant engineer of the Northwestern Railroad, recently returned from a hunt in Colorado near Pagoda Peak and along the West Fork of Williams River. He killed a very large number of blacktail deer, but got no other game, though he saw some elk and bear sign. In his shooting he used a Winchester .50cal. single shot, with 140grs. of powder. This weapon would kill a deer like a rabbit. He varied its use with a .45-90 rifle. One day he killed a big buck, and his companion, a ranchman of the country, discovered on skinning the animal that it had been shot through the shoulders with a small caliber bullet. This shot passed directly through both shoulder blades, a location which should have dropped the deer at once. At the point of entry the bone was shattered but little, the hole being but about ½in. across. On the opposite side the ball passed out, leaving a clean, small hole. The flesh about the wound was green and unwholesome, but the wound was healing and the deer was lively and able to run. Several Männlicher rifles had been used on deer in that vicinity earlier in the fall, the guide said.

The second case of the use of one of these small-bore rifles is reported to me by Dr. C. B. Sayre, of this city, who recently returned from an elk hunt in Montana. Dr. Sayre, being advised that one of the small calibers was the correct thing, took along one of them and did not take any other rifle. He killed three elk with this gun, using in all cases the soft nosed bullet. The first elk he shot was struck in the neck, and it fell as if hit by

a thunderbolt, the wound being very large and deadly in its nature. Seeing the killing of this animal, all of Dr. Sayre's friends wished that their rifles were the same as his. Before the trip was over they were glad that they were not the same, and Dr. Sayre reports that he considers that the weapon is absolutely unfit to shoot such large game on account of the irregularity in action of the bullet. His next elk was shot several times with his small caliber rifle, but no shot stopped it. It was shot in all twenty-two times, being finally finished with a six-shooter. Dr. Sayre told me that he wanted to kill a bear, and that had he stayed a week longer he could undoubtedly have had a shot at a bear, as they saw signs of bear feeding at some of the elk carcasses, but he said he had so little confidence in his gun that he was afraid to tackle a bear with it and so came out of the mountains. This report is quite contrary to the glowing accounts given by some hunters who have had nothing but good luck with these guns. Dr. Sayre says that the mountain men advised him to shoot a .45-70 Government cartridge. All big game hunters will know that was good advice. He was advised against the .45-90, and again wisely, for there are very few old hunters who would not tell him that the .45-70 is by far the better arm for big game than the .45 90, facts being much better than theories.

The party of which Dr. Sayre was a member consisted of himself, Dr. J. P. Letts, William Gee and Charles H. Whitcomb, of Chicago, and Mr. T. A. Caauthers, of Lincoln, Neb. They went to Red Lodge, Mont., and hunted north of the park, having the well-known hunter, Ed. Van Dyke, as their guide. They were out seventeen days and got nine elk, all good specimens. Dr. Sayre killed three, Mr. Whitcomb three, and the others killed one each, Mr. Whitcomb getting also a deer and Mr. Gee two deer. They met fifteen inches of snow the first week they were out, and had to lie in camp two days. They had a pack train of seventeen horses.

Luck of the Chase.

It is reported that the party among which were numbered General Miles, Mr. Vanderbilt and Mr. Webb, of New York city, returned from the West without having killed a deer or any other head of game.

Mr. J. V. Clark and Charlie Spalding have returned from a short deer hunt in Wisconsin, Mr. Clark with a 200lb. buck.

Mr. F. H. Lungren, the well-known artist of New York city, whom I mentioned lately as having gone for another trip to his favorite field, the Navajo country of Arizona and New Mexico, has returned from that region and is spending a little time in Chicago prior to his return East. He reports a trip full of hardships of the physical sort, but also full of artistic results. Mr. Lungren says that the big tribal hunt of the Navajos, their annual antelope round-up, did not take place as scheduled last month, as the weather was unsuitable; so the body of native hunters, something like 400 or 500 of them in all, moved off to other country where the game was more abundant. He describes these great annual drives of the Southwestern Indians as grand spectacles of life and action, but disastrous to the antelope, which are nearly cleaned out over the country by such a hunt. They are driven into pens or over cañon walls, much after the fashion the Northern Indians had of hunting the buffalo.

Among the Wildfowl.

We have had a second snowstorm here this week, and as a result the flight of ducks is the best seen here this fall. It is now thought by some of the old shooters here that the birds have not been down at all before this, the weather north of here being too warm and mild. This storm no doubt means the closing of the waters above here, and will end up the Northern wildfowling within the next ten days.

At Koshkonong the ducks are reported in abundance this week. Mr. R. B. Organ and Mr. B. Dicks go up as guests of Eddie Bingham on the old Bingham homestead on Koshkonong, leaving here to-night. They should have shooting.

At Water Valley the duck shooting has been better the past week than at any time for years. Mr. R. W. Rexford last Monday, shooting on the Kankakee Marsh, near Lowell, Ind., bagged twenty-seven mallards at one hole, and came out, saying he had enough, though he thinks he could have killed seventy-five had he cared to do so.

Mr. F. R. Bissell, of this city, goes to Water Valley, Ind., to-morrow for a try at the ducks, and should have some shooting. Mr. Bissell has a nice little cottage at Water Valley, and he and his wife have frequent shooting trips there.

Mr. J. J. Dickey, superintendent of the Western Union Telegraph Co., at Omaha, Neb., reported a very good week of sport on ducks in South Dakota east of the Rosebud country on a series of lakes he and his friends have discovered. They got 150 ducks of different varieties, but only one canvasback.

Mr. Harry Loveday is back from his Minnesota ducking trip, which he thinks was planned for too early a date. On the last day he shot the birds worked better than at any other time, and, singularly enough, it was on a northbound flight that they got their shooting then. On that day Mr. Loveday got forty fat mallards, and his friend, Mr. Ed Hughes, got twenty-eight mallards. Other members of the party were Maj. Sanborn and Messrs. C. D. Gammon, S. M. Sutherland and John Grey, of this city, and Mr. R. R. Street, of New York city. Of these the high bags, all however of mixed ducks, were: for Mr. Street fifty-one, Maj. Sanborn and Mr. Grey fifty-three each. In the last few days of their shooting they bagged 326 birds—not a very great number, they thought. Last year the same party killed 1,500 on their fall hunt, and four years ago the party killed 2,900 ducks. They shot in each case in Ottertail county, on Dead Lake, the headwaters of the Red River of the North. In this locality they found a great many sharp-tailed grouse migrating from the North to the timbered region near by, and of these they killed a number.

Messrs. Fuller and Morris, of the English Lake Club house on the Kankakee River, came very nearly entirely redeeming the reputation of the old river a little over a week ago, for between them they bagged 103 mallards in one day, which certainly is enough to satisfy anyone on earth.

Mr. T. P. Hicks is back from his trip to Redwood, Minn., where he did not work hard for shooting, but got 150 ducks at odd times.

Mr. Bissell, secretary of the State Sportsmen's Association, says that his trip to North Dakota, at Dawson, was most satisfactory. He had fine shooting at ducks and geese, as earlier mentioned. He saw the weird dance of the sandhill cranes for the first time on this trip. He reports no chickens in that country, and the local hunters say the extensive fires of the last spring entirely burned out the birds.

Mr. Walter Dupee, who has hunted every week until this week since the first of the season of this fall, says that the duck shooting has been very poor over this part of the country. He has been going out into North Dakota for several years along the Soo line, and says he saw a great many ducks at Kenmere, on that road, though at that time he was not out after ducks, but chickens. He thinks that was the best chance for ducks he has seen this year.

Shooting at Swan Lake Club this fall has been very rocky, though one does not know nowadays what a night may bring sorth in late mallard shooting, for which these waters are noted.

Mr. Abner Price has been out for a little trip at Duck Island Club, below Peoria, but at this writing we do not have word of any very great shooting at that locality as yet this fall. It is very likely that this week and the one just past are to be the record weeks of this year for this vicinity.

Among the Quail.

It is a trifle early as yet to speak of the quail shooting for this season, but it is already clear that we are to have the best shooting in Illinois and Indiana that has been known for some time. No one who can take time to run south of this city over night need lack for opportunity to enjoy the pleasant sport of quail shooting. Of course, it is always desirable to know good country. It is a mistake to think that one is obliged to go south of the Ohio River to get good shooting on quail, but really the closer one can get to the Ohio the better are his chances. In Illinois anywhere down the Illinois Central R. R., say as far as Champaign, one is sure this year of finding birds. If he go to Mattoon, better yet to Effingham, on that road, he will be in the center of the best sort of quail country, and can moreover get cross roads to take him east and west into the little towns lying in that part of the State. As far south as Vincennes the birds are abundant this year. If one go to Newton, Ill., he will be well located, or at Mt. Vernon he will have splendid country. Any of the little country towns of that part of the State, such as Dubois, Ashley, etc., will be good headquarters. Around Centralia there is good country, and near Arcola. In fact, anywhere below the upper half or two-thirds of Illinois the quail are numerous enough this year to offer all the shooting any one need want. Moreover, the water is abundant this season, so that the birds are well scattered and offer a varied day's sport in a walk across country, not being confined to the water-courses, as they have been in the last few dry seasons. These points on the quail I have from my friend Charlie Antoine, who shot all over that part of the country last year and the year previous, and so knows what the situation is; so the news can be held safe as any advice can be on shooting grounds, always subject of course to local conditions of change such as too much market shooting.

Mud Hens and Rail.

The veteran duck shooter, Abe Kleinman, answering the queries of some novices the other day in my hearing, said that in his belief mud hens were as good to eat as mallards, and that before long all the shooters would be glad enough to get mud hens to shoot. He was explaining that the mud hens migrate by night, coming down in big flocks from the North, and he added that the rail migrate in the same way, always by night. He says a rail can fly as well as any bird when it tries.

Mixed.

Mr. C. N. Souther, city ticket agent of the Milwaukee & St. Paul road, did not get any ducks on his trip to Wisconsin a week ago, but found some good squirrel shooting. He and his friends killed fifty-one fox squirrels, and moreover discovered what they state to be some very good ruffed grouse country.

The largest deer killed in Wisconsin this season, so far as I have record, is one killed by Mr. Boyce, of this city, near Ashland, Wis., a buck which weighed 264lbs. dressed.

Mr. H. D. Nicholls, a member of the Cumberland Gun Club, a shooter well known in Illinois State Association matters, has just been elected to the State Legislature. The sportsmen are therefore sure of at least one solid friend in the house, and an effort will be made to use Mr. Nicholls's influence in the passage of a better game law.

Mr. N. H. Harris, of this city, has recently returned from a trip to Arkansas, where he killed a deer and a turkey and had a very pleasant time.

Mr. J. W. Upsall, of Watseka, Ill., tells me that his father and some friends went to Arkansas for a shooting trip, but never unpacked their stuff and turned around and came back home. They found they would be obliged to pay a license, and would not be allowed to ship any game out of the State.

Messrs. Walter Dupee and Oswald von Lengerke, of this city, started yesterday for Trenton, Tenn., where they will have a week's quail shooting with W. B. Stafford, who handles Mr. Dupee's dogs.

Although it is very late in the season, the bass fishing in the Kankakee River is better now than it has been any time this year. The small-mouth bass are biting finely, and large strings are being taken at different points of the river from Koutts on down.

For woodcock shooting in season I am advised by one who knows that the country along the Mississippi River, above La Crosse, Wis., is as good as any in the West. Take the train at La Crosse and run up one or two stations. This to be borne in mind for next year.

On his last trip to the Kankakee Charlie Antoine made the mixed bag of fifteen jacksnipe and four prairie chickens. He also saw three bevies of quail, though the law was not yet up.

A bull pup belonging to Mr. J. G. Bushnell, of this city, went on the war path this week and bit four persons—Joseph Whitford, Marcus Smith, Edward Howe and Dr. Thwaite. On the supposition that it was a mad dog it was killed. It would have been the making of the pup if they had let it alone.

Luck of the Colored Hunter.

While in my office this week, my friend Tom Divine, of Memphis, was looking over the various bear trophies from Mississippi, and blowing all the horns in the office, including Tom Glover's E flat Texas horn, all of which reminded him of big game matters in Mississippi; and he told me a story, which has the merit of being true, in regard to the luck recently had by a negro hunter in the canebrake country south of Memphis. The negro, it seems, was watching at a water hole for a shot at a bear, and was lucky enough to get it. He killed the bear, which weighed 450lbs. He sat down and waited for his partner to come up, and while sitting there quietly he heard a cracking in the cane not far from him. Thinking this might be another bear, he kept still, but in a few moments found the animal was not a bear, but a panther. The latter seemed to think he could make a square meal off the bear, but as he began to snuff around the bear the negro shot and killed him also, the two animals lying close together. A few moments later the negro's partner came over that way, following two hounds, which were trailing. As luck would have it, the hounds put their game up a tree near the water hole. It was a big wildcat, and the same negro killed it almost from the same place where he stood when he shot the bear and panther. It must have been his busy day. Mr. Divine personally saw the panther, which was shipped entire to Memphis, and says that it measured 8ft. from tip to tip, one of the largest he ever saw. If I should see this story in any paper but FOREST AND STREAM, I should think it wasn't so, but the odd part about it is that it is true.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

The Neaville Boys.

AN old friend from Ashland, Wis., sent me a copy of FOREST AND STREAM containing the sketch of Charles Guyon, not knowing that we get the paper here. He writes: "I send it because I know it will interest you very much, as you know all the characters mentioned in the story and I can imagine you reading it to a group of friends, who will also enjoy it because it is so well written."

I am not surprised that he was pleased with that article, but what will he think when he reads of Henry and Frank Neaville? This last is fine; it is a perfect portrait of each of the boys and their manner of speech at that time. Frank was a bright young man, and was a clerk in a store until he enlisted and went in the army. Henry, as Mr. Mather says, was not so bright on the exterior, but was a sort of "singed cat, better than he looked;" and lazy! Oh, my! He was the perfect picture of ease and present enjoyment. No doubt he enjoyed having his feet frozen, as it gave him rest, and had they been taken off would have insured him perfect felicity. He could work and endure discomfort, and the heroic words he expressed about his frozen feet are a key to his character. I liked him very much. He was a noble boy, and his early pathetic death in his country's service proved his devotion to his friends, flag and country.

Mrs. Neaville, mother of the boys, thought she had a presentiment of their death that summer. After her roses had all faded two more white ones came upon the bush, one after the other, bloomed for a time, then drooped and fell. The old people never recovered from the loss of their two good boys. Mrs. Neaville died last year, near Brodhead, Wis. She was an excellent woman, and Mr. Mather's article would have comforted her if she could have lived to see it.

I hope the author, who was well known here forty years ago, may live long and continue his interesting articles on "Men I have Fished With," and put them in book form, so that when he is taken from the stream of time his friends may receive a royalty from them that will be sufficient to rear a monument that will perpetuate his name and fame as a second Izaak Walton to all time.

W. S.

POTOSI, Wis.

A Successful Maine Trip.

CAPT. JOSEPH B. TAYLOR, of the Albany-Bath ferry line, has returned from his annual hunting trip to the Maine woods, and reports a glorious time and game galore. During his stay in the woods he saw several moose, many caribou and deer without number. Joe Francis, the well-known guide, looked after his welfare, and the results of the hunt are a huge moose with 53in. spread of antlers, with very broad palms, showing him to have been an old-timer; one caribou and two deer. The dilapidated condition of the ears of the moose, including a bullet hole through one of his ears, shows that the old fellow had had many a brush and at least one hairbreadth escape. Crosby, the Bangor taxidermist, who has the heads, pronounced the caribou head one of the finest Maine heads he ever handled; in fact, says that it is seldom equaled by any brought from Newfoundland.

The party arrived in the woods in the last few days in September, and enjoyed several days of excellent trout fishing before the hunting season opened.

Capt. T. reports that lumbering operations have been begun in the forests of the West Branch waters on lands that were lumbered about twenty-five years ago, the dilapidated dams are being rebuilt, and operations will be prosecuted on a large scale for the next few years. This will be unwelcome news to very many of the readers of FOREST AND STREAM, but let us hope that the vigilance of the Maine game warden will be equal to the occasion, and that we shall not have a recurrence of the wholesale butcheries of a quarter of a century ago.

Judging from the number of very fine negatives obtained, the Captain seems to have been quite as successful with the camera as with the rifle.

My congratulations on the result of the vote on the forestry amendment.

S.

TROY, N. Y., Nov. 4.

Moose in the Ox-bow Country.

NEW YORK, Nov. 4.—We have just returned from a trip to Ox-bow, Me. Got a fine 1,000lb. bull moose and several deer. Had the best guide and moose caller in the woods, Ed. Junkins. He did what many claim to be impossible, called up a moose on a hardwood ridge at noon on Oct. 17. That's rather late in the season for calling too. Deer we could have got almost any day. Caribou signs very plenty, but didn't get a chance at any. We only hunted nine days. Am going again next year and stay longer. If any one wants Ed for the first snow he could make arrangements, I think. If one is a pretty good shot and can stand hard traveling all day, I'll bet a hat he can get a moose in two weeks with good tracking weather.

F. W. K.

THE LONG ISLAND DEER SEASON.

IT is estimated that at least 150 deer were killed on Long Island Wednesday, Nov. 4, which was the first day of the open season. Twenty-nine deer were brought into Sayville as a result of this one day's shooting, and about forty are credited to Patchogue hunters. This of course does not include the deer killed by the Smithtown, Hauppauge and other parties who came down from the north of the deer grounds, and it is safe to say that the large estimate given above is not exaggerated. This is a remarkable showing, and it is a question whether, from the standpoint of numbers, there is any better deer hunting in the United States. The entire deer country only occupies an area of about twenty-five square miles, and much of this is included in the grounds of the South Side Club and those of Messrs. Vanderbilt, Cutting and Roberts, where no shooting whatever is permitted. The open territory is therefore extremely limited, and at the best points twenty or thirty deer are killed in a day. On a good stand the hunter will see more deer before 8 o'clock in the morning than he will see in open season in a month in some parts of the country that have reputations as deer hunting sections. But whether he kills a deer or is killed himself is beyond human forethought to predict.

There are three more days of open season on Long Island this year, the 11th, 18th and 25th. Judging from previous experience it is safe to predict that the total bag of these three days will not exceed that of last Wednesday. No doubt some deer will be killed in the close season which intervenes, and local papers hint that there were hunters who did not wait for the opening day to begin the slaughter.

But the main reason why the other open days will not be so good as the first is that most of the deer that were then started were killed. Very few indeed escaped to the refuge afforded by club grounds or posted property, and those killed hereafter will be animals that were on safe ground when the first gun was fired. J. B. BURNHAM.

With the Quail on Long Island.

NOV. 2 dawned bright and clear, an ideal day for the first of quail shooting. After a hearty breakfast at Harrison Rogers's, my guide and I jumped into our wagon and with guns and dogs hastened to our shooting ground, about a mile and a half east of Eastport. We were accompanied by a well-broken English setter, over anxious to get in the field again after a lazy summer. Upon arriving at our destination we tied the horse in the woods and started out with high spirits for our first quail of the season.

Unfortunately we found that a party of sportsmen had already covered the ground near by and had flushed a bevy only a short while before. Our luck during the forenoon was rather discouraging, as we only flushed three single birds, killing two of these in spite of the dense woods in which they rose.

By 12 o'clock the bracing air had put a keen edge on our appetites and we decided to lunch. After emptying a good-sized pail of good things and enjoying a cigar we drove a mile further on and started out with fresh hopes to try another section. After covering considerable ground with no success our dog came to a grand point at the edge of a field of stubble. We flushed a bevy of about thirty birds and surely it was a sight worth going miles to see. We killed three as they rose and marked the rest down in an adjoining field of low brush.

During the remainder of the afternoon we had fine sport, flushing singles and pairs all around us, with very little walking, as the birds lay very close. I soon had my hand in again and made good scores, including two very neat doubles. The birds were all large and fat, and with a bag of seventeen quail and one partridge I was well content.

I had to return to New York next morning to vote, but hope to have another day or so with these fine game birds before the season closes. G. P. GRANBERY.

Our Native Fur.

LANSING, Mich., Oct. 18.—Yesterday a young man from Delhi called at my office and showed me several skins of the fox squirrel and rabbit and woodchuck, which he had tanned himself, and I was greatly surprised to see such fine large skins, and find them so tough and so strong and well furred. In Europe the skin of the squirrel is used extensively in the fur trade, and in this country the rabbit of Australia is used largely in the manufacture of caps and gloves and mittens under the name of Australian bear. It is a wonder to me that there is no home market for such fur as that of the fox squirrel and the different rabbits which are so abundant in this country. Certainly the skins of the Northern squirrels of the larger variety, and the rabbit, especially the big white rabbit of Michigan, is as fine for manufacturing purposes as any animal's of its kind in the world. And then, too, they are so abundant and so many of them are killed that if the fur could be used it would be a matter of great commercial importance. Can you give us any light upon this subject, and its relation to the fur trade?

JULIAN.

[Tame rabbit skins average 2 cents, wild 1 cent; woodchuck and American squirrel skins have no market value.]

In Ontario Covers.

PETROLIA, Ontario, Oct. 26.—Ten years ago everyone said there would soon be no partridges around here to shoot; but this year there are more than there were ten or twelve years ago. Last summer was a good season for everything around here; the rain came on about June 1, and we had nice rains all summer which seemed to suit the rearing of young birds. That is the only reason I can give for such an abundance of birds. I was very much interested in your article on the ruffed grouse; I have had many of the experiences mentioned therein. Quail are scarce in this locality for some reason unknown to me.

A friend while out one day last week for partridge shot a white red squirrel; it was pure white all over. One of my men informed me that his little boy also saw a white squirrel. Please let me know if they are common or not. By the way, coons appear to be quite plentiful this fall, also black squirrels. Shot what I thought to be a gray squirrel, others said it was a fox squirrel, but I do not know what the difference is between a fox and gray squirrel. I know I never saw anything like it in this locality and I have shot here for years.

AN OLD SUBSCRIBER.

[White or albino squirrels have been recorded. The fox squirrel was not named for Ontario in the recent report of the special game commission.]

BELLEVILLE, Ont., Nov. 7.—Ducks have been quite numerous, but so shy that hunters have done poorly.

Plover have been with us in large numbers and many good bags were made.

Squirrels—black and gray—and partridges have been more than usually plentiful this season and afforded fine sport. Partridges are generally got in this district by treeing them with dogs.

Deer hunters have gone forth to the woods in legions, but the weather has been too warm and wet for sport, and reports are consequently unfavorable.

I imagine that Antoine Gardapee, of whom Mr. Mather has written so entertainingly in your columns, was named "Gardapui"—a name quite common among our French-Canadians and the metis of our Northwest. R. S. B.

A Maine Game Record.

BANGOR, Me.—*Editor Forest and Stream:* I send you the record of game shipped over the Bangor & Aroostook Railroad during the month of October, 1896:

Shipped from	Deer.	Moose.	Caribou.
Fort Fairfield	1	1	..
Easton	..	..	1
Mars Hill and Blaine	1	..	..
Island Falls	5	..	..
Crystal	2	..	..

Sebec	1	..	..
Total game shipped	1,029	79	57

The totals for October of this year compared with the same month in 1895 and 1894 are as follows:

	Deer.	Moose.	Caribou.
Total for October, 1896	1,029	79	57
Total for October, 1895	669	53	37
Total for October, 1894	479	24	10

The above statement, compiled from records kept by station agents, comprises only game shipped by visiting sportsmen, and does not include that killed by native hunters, nor the large quantity consumed in camps.

There were also shipped during October, 1896 eleven bears, one lynx and a large number of ducks and partridges.

GEO M. HOUGHTON,
Gen. Pass. and Ticket Agent.

Deer in Southern New Jersey.

EGG HARBOR CITY, Oct. 31.—The deer season opened Oct. 25. My brother, myself and four others placed our dogs in the wagon and drove to Reed's Neck, where signs of deer were plenty. As soon as the men had their stands the drive was commenced, one man working the dogs until game was started. This was not done until near noon, when the deer were started in a point of a large cedar swamp. The wind began to blow pretty hard in the afternoon, making it impossible to hear the dogs; but one doe headed straight for the water about five miles from where she started, Lake Lenape, near May's Landing, where were another party of hunters, who shot some ten or a dozen times at the deer, but failed to kill her.

This ended our first day's hunt, all the rest of the week being too dry to do anything with them. Another party killed a nice buck, this buck being one of the largest killed here in several years.

Our next trip was more successful. We started a fine large doe, and after a pretty long chase it was killed by Jacob Green. This ends deer shooting in New Jersey, as our season was only ten days long. R. B. P.

Rhode Island Notes.

PROVIDENCE, R. I., Nov. 6.—Officers Smith and Tobin, of Georgiaville, arrested last Sunday a band of hunters, equipped with ten hounds and a keg of beer, for hunting on Sunday, and with ferrets at that. The man who had a ferreted rabbit in his pocket paid a fine of $5.

It is probable that other arrests will follow, as the remainder of the party are known, and the town authorities are determined to put a stop to further infringement of the laws in regard to Sunday hunting within its borders.

Two gunners started off a few days ago, guns in hand, to shoot gray squirrels. Having arrived in the woods and tramped the entire forenoon without any success, they sat down to eat dinner. While they were busily engaged in satisfying the inner man their attention was called to some object away from the log on which they sat, and they went to investigate. When they returned to their dinner, behold their surprise at seeing the only squirrel of the day running away with one of their doughnuts, which they had laid by the side of the lunch pail. W. H. M.

Black Game and Capercailzie for Vermont.

SHELDON, Vt., Nov. 6.—*Editor Forest and Stream:* I have received from Sweden twenty black game and fourteen capercailzie for distribution in this State. We believe that our Green Mountain forests are specially adapted for this kind of game.

We are trying to get a law passed making a penalty of $20 for Sunday-shooting, which will put a check to the work of the Sunday shooting young French pot-shooter who shoots everything that comes in his way with his cheap breech-loading shotgun. W. P. LEACH.

Massachusetts and Maine.

BOSTON, Nov. 6.—Mr. C. H. Cook and Mr. A. J. Norwood are off for a moose hunt. They will go to Big Fish Lake, in Upper Aroostook county. Orcutt's camps are their destination. A. S. Sleeper, of Chelsea, and Arthur Bucknam are at home from the neighborhood of the Katahdin Iron Works with a deer apiece, for which they had to work very hard indeed. The leaves were particularly bad in the rustling qualities, and but little rain fell in the section they visited. They were absent for nearly three weeks, and it took two weeks of hunting to get their game. E M Gillam started on his annual vacation and hunting trip to-day. He will go to Vineland, N. J., there meet his brother, and hunt quail and partridges in the best section of that State and Pennsylvania. They also talk of a trip to North Carolina for more quail, or to Maine for a deer.

Late Bangor reports seem to show that more big game is coming, though there has been a lull in the slaughter, with the hunting reported to be bad by reason of the fallen leaves. The report says that the shipment of game on Monday was the largest ever received in that city. There were sixty-three deer, two moose and five caribou. The largest previous shipment was on Monday, Oct. 19, when sixty-five deer and four caribou were received. I learn from the express people that nearly one-half of it does not go out of the State. A good deal goes beyond Boston. But after all Boston sportsmen get their share of Maine's big game. It is easy to make up the following record of big game brought here: H. B. Wellington, F. H. Talcott, two deer; Oliver P. Hoyt, one deer; G. K. Russell, one deer; N. S Manson, one deer; Edward Salley, F. P. Smith and John Martin, six deer; G. H. Lanphier, one deer; R D. Jones and E. Dana, two deer; F. A. Mann, one deer; H. A. Wood, A. R. Van Tassel, E D. Van Tassel and J. L. Richards, seven deer; N. M. Conant, one deer; D J. Flanders, one deer; W. S. Coggin and S. Matherson, Jr., two deer; L D Cameron, of Amesbury, one deer; James Sargent, of Waltham, one deer; C. S. Thrasher, of Taunton, one deer; S. Elmer, of Sherbern Falls, two deer; A. H. Sargent, of Haverhill, two deer; Geo C. Basson, Jr., of Lawrence, and E Frank Lewis, two deer; H. E Eustis and A. P Hendrick, of Brookline, three deer; E C. Whitney, of Orange, two deer; N. A. Belcher, of Brockton, two deer; N. M Jones, of Ipswich, two deer; Dr. F. A. Townsend, of Worcester, a moose; L L Martin, of Winchester, a caribou.

H S Fisher and E. J. Mitton are out of the Maine woods with a moose apiece. This is Mr. Fisher's second moose, and his many friends among sportsmen are pleased with his remarkable success. Mr. Fisher and Mr. Mitton are both interested in the Dry Goods Club at Sebago Lake. SPECIAL.

Ruffed Grouse and Rifle Range.

STATE OF WASHINGTON, Oct. 14.—*Editor Forest and Stream:* In an article in FOREST AND STREAM of Sept. 26 you speak of the ruffed grouse being able to take care of themselves in Minnesota and Wisconsin. They can also do so here in this northwest corner of Uncle Samuel's possessions, as was proved to my satisfaction the other day, when I took my .22 rifle to go up the creek and get a few ruffed grouse. My old dog Frank is at a neighbor's some 125 miles away, and I have a youngster I call Dick, who is good for ruffed and blue grouse, but of no account for the sharp-tails.

We had not gone more than 100yds. before Dick flushed a grouse; but he could not tell where it went, and he will not bark unless he sees the bird alight; then if he flushes the bird by his barking he will quit unless he can locate it. We could not start the bird the second time. We kept on up to the base of Mount Bonaparte and hunted for over an hour before we started another, and it was like the first. Then I turned and came down the main creek, and soon flushed four, not one of which treed. Soon I flushed a single, but it went off down the creek for at least a quarter of a mile. I marked it down and we flushed it again. I kept count of those I flushed until I came to where the cows were, which I had to drive home, as it was nearly sundown. There were nineteen birds, and not one could I get a shot at; so you see they are pretty well educated even here in the backwoods of Okanogan.

LEW WILMOT.

Florida Game Season.

JACKSONVILLE, Fla., Nov. 2.—Ducks were reported numerous at Ft. Thompson, Lake Flirt, on the Caloosahatchie River, Oct. 19. They were the first flight from the North, which always pass over the upper part of the State and settle in South Florida. A few bluebills or raft ducks are reported in the creeks around Jacksonville, but none stay on the river at this season. Later in the season there will be plenty of them on the river.

The open season for quail and turkeys commenced on the 1st inst., and they promise to be very plentiful, especially the former.

The hammocks are full of squirrels. I shot thirteen last Saturday afternoon, with a dog, and a boy to shake the vines on the trees. In this State the squirrels hide in the luxuriant Spanish moss that fills the tree tops, and it is very difficult to see them after the dog has treed them; but with a boy to shake the vines that generally cover the the trees they run out of their hiding places, and can be seen and shot. Without a good dog, a person might hunt all day and hardly see one. J. F. LE BARON.

Maine and her Game Resources.

BOSTON, Oct. 30.—*Editor Forest and Stream:* In looking over the pages of the November issue of the *Maine Central* I was astounded at the quantities of large game now passing through Bangor almost daily. It seems almost incredible, and it just made me wonder how long, even under the most fostering conditions, this region could stand such a tremendous drain. I quote from the above journal items picked up at random from Oct. 1 to 15, giving a general idea for the whole month: Monday, Oct. 12, was a record so far as the amount of game which passed through Bangor is concerned. The exact figures for the day were 63 deer, 6 moose and 3 caribou. Tuesday: 51 deer, 3 moose, 1 caribou. Wednesday: 36 deer, 2 moose, 3 caribou. Friday: 58 deer. 10 moose, 1 caribou. Saturday: 67 deer, 4 caribou. Total: 275 deer, 21 moose, 12 caribou. And that is only a five days' record of what passed through Bangor.

Well may Maine legislators and conservative sports

men ponder over these figures. The good Lord and artificial propagation combined will be powerless against such slaughter as this. Unless more stringent measures are speedily enforced the child is born who will roam this vast tract and not encounter a deer, moose or caribou. Mr. E. C. Farrington, secretary of the Maine State Fish and Game Association, sizes up the problem well when he says: "If the State is to retain its great game preserve and keep it adequate to the demands that surely will be made upon it, something must be done more far-reaching and effective than ever has been in the way of legislation."

Now then as to remedies. First and foremost FOREST AND STREAM'S platform plank: Stop the sale of game. Second, have the open season for all kinds of game the same date; have its close the same. Third, limit each sportsman to one moose, or one deer, or one caribou for the season. Fourth, make it an offense, under penalty of seizure and confiscation, for any one to carry rifle or shotgun into the woods during close season. J. W. B.

In New Jersey.

ASBURY PARK, N. J.—Advices from the game quarters of this (Monmouth) county are most encouraging. I am in receipt of a letter from a friend, who writes: "Be sure and come on the first day, which is Nov. 10; I have plenty of quail and more than enough rabbits on my grounds." Perforce I will lay aside my work and make a ten days' trip through old Monmouth covers, and will report what I find to our paper, FOREST AND STREAM.

LEONARD HULIT.

The Arkansas Outlook.

LITTLE ROCK, Ark., Oct. 27.—The weather is too warm and cover too heavy for quail shooting. A big flight of ducks passed South last Friday, few remaining with us. In November and December we shall have plenty of sport.

J. W. IRWIN.

Quail Around Omaha.

OMAHA, Neb., Oct. 28.—Quail are quite plentiful this fall in the Missouri valley. With a few hard frosts to lay the weeds and thin out the leaves, there will be good sport to be had near this city.

W. D. KENYON.

Sea and River Fishing.

MEN I HAVE FISHED WITH.

XX.—First Sergt. Frank Neaville.

THE snow had left the south side of the hills and there were evidences of spring overhead and underfoot when I parted with Antoine, he to visit some friends up the river and I to settle down in Potosi to a civilized life. To get shaved again, to sleep in a bed and renew acquaintance with a potato after a winter in the woods, was an agreeable change. Few men who have once lived the life of a hunter and trapper ever care more for civilization than to keep on its outside edge, and they move on as it drives them to seek new fields. I imagine such men find it dull in summer, for they are seldom reading men, and when fur is not in season their lives must be monotonous. I soon dropped into my old way of life in the quaint little mining village of Potosi.

"Goin' a-fishin'?" asked Frank Neaville, as he saw me selecting some fishing tackle in one of the stores. "Henry has a new boat and he's goin' to take it down to the landing soon, maybe you can get him to go to-morrow; you know he's always ready for a fish or a hunt, no matter what's goin' on."

We walked down to the hotel kept by the father of these boys and found Henry in the back yard putting a painter into a ring in the bow of a new boat and making a neat eye-splice in it, for Henry could do many such things when he chose. "Hello, Henry!" said I, "you've got a nice sharpie there, but in our talks since I came down from the Bad Ax you haven't mentioned it."

"What's that name you called the boat?"

"A sharpie. What do you call it?"

"I call it a skiff, and it is a skiff; sharpie is some of your New York language, I suppose; did you ever hear of a skiff?"

"Yes, and they are two different boats in the New York language, but we won't fight about that. I want to go fishing to-morrow, and if you want to try the new shar—skiff, I mean, just fill her full of water to swell the seams and get her on the wagon in the morning, that's all."

Frank called attention to the fact that there was room for three, and intimated that he would go if his company was earnestly desired.

"Frank," replied his brother, "you know that you're the durn'dest fool in a boat that lives in Wisconsin. Last year you upset us when we were coming down Swift Sloo by grabbing a branch to look after some wounded bird and we had to stop all night on the island and be eaten by mosquitoes because Fred's rifle was in the bottom of the sloo. We don't want any more of that funny business and you had better stay home." Then turning to me, Henry explained: "Frank's all right to weigh out sugar and coffee in a grocery and he can figure up how many papers of tacks would balance a pound of nails, but you had a sample of him last year; he hasn't got good, sound sense, like a mule, for a mule can take care of himself any time and wouldn't dump us all in the drink to look at a pelican. If you can stand him, all right, I won't object."

Then it was Frank's innings. He was the younger but larger of the two, and he replied: "Henry is the bright boy of the family, and very few families have more than one bright boy, if they're so fortunate as to have even one. He is the oldest and there are several little fellows growing up, and if I'm not as brilliant as Henry I can't help it, but I hope some of the little fellows may come near his high standard. I don't want to go if I'm not wanted." And he turned off and went into the house.

This was the first time that I had seen Frank resent Henry's good-natured chaff, and I hurried after him and brought him back. Said I: "Henry, I want Frank to go with us, and, confound you, you want him to go, but your temptation to roast him over that upset is fun for you, but Frank doesn't like it. As a student of Shakespeare, you will remember that somewhere he says that a joke requires a good listener, or something of the kind, to make it go. Frank thinks you are bearing too hard on him for his mistake and it's time to let up."

Henry laughed and said: "Frank never knows a joke when he hears it; wouldn't know one if he found it in his soup. That thing of Shakespeare's just fits him; he said something about a joke being lost in the ears of some men, I cant recall it now.*

"Of course, if Frank wants to go fishing with us, all right, I've no objection, and in fact would like to have him go; but since the time when we slept out on the island I have gone fishing a dozen times and he has never asked to go. I think he likes your company. Come along, Frank, I only wanted to knock a little fun out of you and you go off mad." Frank winked at me; he was not angry the least bit, but this was his joke on his brother.

In the morning we walked behind the wagon which carried the boat to the river, for it had a load of lead. I took my rifle along because I wanted some meat either of duck or hog, or both. As related in my sketch of Henry four weeks ago, there were hogs on the islands and I had bought an interest in them. I also had several cane "poles," as we called them, and loaned one to each of the boys. I was inclined to be a "dude" sportsman in that early day, if we interpret that abused term to mean a man who likes to own the best things that he can get and who will pay a quarter of a dollar for a light natural cane in preference to using a heavy sapling cut in the woods to be thrown away after using. In fact, I would to-day, if not then, rather be a "Sunberry Fisher" than his opposite. The London *Punch* created "Ye Sunberry Fisher" many years ago, and in order that a generation which has grown up since its publication may know just what kind of a fisherman he was I copy from my scrap book the poem from *Punch* and send it to the editor, who may possibly think fit to print it. In these days of game hogs and of men who fish for count and brag, I say with due deliberation and with full knowledge of the ridicule to which a man with fine fishing tackle is subjected if he is unsuccessful in a day's fishing, that I would rather be in his place and own tackle to be proud of than to be the proverbial boy with an alder pole, a "letter in the post-office," and a big string of trout.

With the man who loves fishing for itself and not for the fish, the capture of a record-breaking string is of no consequence. The old story of the "funny man" catches the popular fancy. To-day when I fish for trout I use a rod which cost $35, and it is worth every cent of it. My reel, line and book of flies cost as much more, and on a trout stream there is no bare-footed farmer's boy with his alder pole and worm who can, day after day, take more trout than I or thousands of other anglers can. He might on an odd day where he knew all the trout holes—but not as a rule. And if he did? Still I say: I would prefer to be the Sunberry Fisher who "caught nothing at all," for why do we prefer a gold watch to a silver one? It may keep no better time. We like elegant harness on our horses, but they pull the carriage no better than if tied to it with bits of rope! Now you young anglers can see just what I mean. There is pleasure to the sportsman in cleaning and caring for his rod or gun; he has a feeling of companionship for it—he gets to love it for the memories it brings, and to throw it aside after a fishing or shooting trip would be base ingratitude. There is a high and noble affection for old companions in the forest and on the stream, and the man who truly loves the sport for sport's sake, and not for the amount of meat he gets, cherishes the implements which aided him. Even a savage will ornament his pipe and his war club—but my pen is straying again and has led me off from the story of this particular fishing trip. Let it go; the editor will probably "blue pencil" all the extraneous matter, and so we get back to the mouth of Grant River, Wis., in the spring of 1856, with the Neaville boys.

Henry watched the boat after it was launched and seemed satisfied with its balance in the water, and we rowed off to one of the islands which are so numerous along the great Mississippi at this point. When we pulled up on the island Henry asked: "Where do you want to fish? Here you can get swift water or still water, just as you want it." A bend where water plants were just struggling to get to the top of the water caught my eye, and it looked like a good spot for pike, so I replied, "I've got some small minnow hooks, and if we stop right here and get about fifty small fish, we may get some good pike over in that bend among the weeds. The result was similar to that recorded in sketch IX., "The Brockway Boys." Skittering for pike or pickerel was a new thing, and all new methods are distrusted. The old woman who saw a patent machine for milking cows looked at it and declared, "The old-fashioned way is the best;" and in this case she was right. Henry did not say a word against it, but, like William Brockway, he thought there might be a thing or two that he had not learned, but Frank said:

"When you put one of these little fish on your hook, and let it down in the water where the big fish live, you may get one; but to 'skitter' a little fish over the surface and scare all the big ones below looks like foolishness, but if you say it's a good plan we'll try it. Mother will expert some fish for breakfast, and I want to go over in a tree top and get some crappies. I don't want to go back without a thing."

Henry had listened to all this, and after some deliberation said: "Let's land Frank in a tree top, and then go over and try for the pike. Mother can't have any of our fish for breakfast to-morrow, because we've got provisions for two days and we propose to stay and eat 'em up if Frank doesn't see another wounded pelican and upset the boat. Yes, Frank, you get in that tree top and fish for crappies, and we'll stop and get you day after to-morrow. We'll leave you grub enough, and there's a good big limb to straddle, so you'll be comfortable until we come back. The mosquitoes are not out yet, and you'll be very happy. If the limb gets to be uncomfortable, you can change and sit on it side-saddle fashion."

Frank looked at me and asked: "Are you going to stay out to-night and not go home until Saturday morning?"

"That was our arrangement and I thought you understood it; when the axe was put in the wagon you asked what it was for and Henry told you it was to cut wood for camp, and we would not need a fire if we were going home to-night; I'm sorry if—"

"No, don't be sorry about me, I'll stay out as long as any of you if you'll only make Henry let up about that accident last summer. If he doesn't stop it I'll duck him again when I can do it without wetting you. Every man, woman and child in Potosi knows about that upset of the boat and that's enough. I don't care about it since I said I was sorry, but all winter, while you were away, he would grin as he passed me and quote from Byron:

"Then rose from sea to sky the wild farewell—
Then shriek'd the timid, and stood still the brave;
Then some leap'd overboard with fearful yell,
As eager to anticipate their grave."

"He used to spout that in school and he thought it would annoy me, but it didn't—well, not as much as he thought it did."

Frank was more sensitive to Henry's exasperating nagging than he would own. It was not so much Henry's quotation from Don Juan as the "grin" which accompanied it, and by constant repetition Frank had become sensitive, as "the touched needle trembles at the pole," and this sort of thing is not conducive to congenial fishing. I told Frank that Henry would find some other outlet for his humor. When Henry came back with some minnows, after we had landed, I took him one side and Frank's peace of mind about the upset was undisturbed afterward.

We caught some minnows and skittered for pike, or "pickerel," as we called them in New York, and took six or seven that day—fish that would weigh from 3 to 6lbs. We had no reels, we weren't up to that in those days, but we had a ring on the top of the rod and gave line, or hauled in through it. Once Frank struck a big one. He yelled: "Come and help me! He'll get away! The line is cutting my hand," etc., and I took his coat-tail in my palm and checked the fish. When it was safe in the boat Frank drew a long breath and said: "Well, I'll be durned if that fish won't weigh 20lbs. If you hadn't helped me he would have broken something or I would have been pulled overboard. Yes, by Jing! He'll weigh 25lbs.!"

My own estimate was that the pike might weigh about 10lbs., but what was the use of putting a damper on the boy's enthusiasm? My new mode of skittering a minnow on the surface had won, his skepticism had vanished, and it was a triumph for both. We went ashore, rolled a log down to the water and dug out a basin behind it, where our fish could be kept alive, their splashings in the water serving to circulate it through the small openings at each end of the log; for we didn't want to kill our game until we started for home.

The day was a fine one and the fishing was fair for those days; it would be called excellent, grand, to-day, and considering the high state of the river we did well. The bend where we fished was comparatively still water, just the place for pike, which prefer quiet nooks and ponds and avoids the quick waters. The geese had passed North, and so had the great bodies of swans and pelicans; but to our surprise a small flock of sandhill cranes went over us, high in the air and glistening in the sun. Most likely the last flock of the season. Frank called attention to them and wondered what they were.

"Sandhill cranes," said Henry.

Frank grinned and replied: "I never saw such a fellow to know everything as Henry is. That flock of birds are too high up to see their shape and he'll tell you just what they are. He thinks he can play anything on me. What do you think they are?"

"Just as Henry named them. Henry is more of a hunter, naturalist, or whatever you are a mind to call him," said I. "He notices things which you don't see. Watch the flight of that flock. See! They all flap their wings in unison and then all stop at once and sail, seeming to follow the 'stroke oar.' Did you ever see any other birds do that?"

"I never noticed them. It is queer, though, how they all work together that way. Don't geese fly like that?"

"Oh, no; a goose is a heavy-bodied bird that couldn't sail a minute up there; it's hard work for a goose from the time it starts until it stops. If you watch the flight of different kinds of ducks and the way they flock you will soon be able to tell what they are. There goes a dozen mallards; see how differently they fly from the bluebills coming up behind them. I can't tell you the difference, but you can see it."

"Well, by jing! That's so. I thought all ducks flew alike. I can tell ducks from crows by the way they fly, but never noticed them as close as that. Henry, old boy! you know a heap more than people think you do; they haven't found you out yet."

Henry made no reply to this, but suggested that it was time to go ashore and make camp. It was quite a job to find a camping spot on the island. It had been well soaked in the spring freshets, and the lower leaves of the underbrush were covered with dried sediment where they had been submerged. Henry knew these islands well, and led us to a knoll near a pond which was dry in summer, but was filled now, and afforded a good feeding place for ducks. We had hauled the boat well up and tied it fast in case the river should rise in the night. We made a little bough house and a bed of dry leaves, made a pot of coffee and ate supper before dark.

As I remember the geography after an absence of forty years, it is some five or six miles from shore to shore near Potosi, the main channel of the river being on the Iowa side. On the Wisconsin shore the Grant River came in and there was a lot of wooded islands along there with channels of all degrees of swiftness between them. In the days of which I write the ducks congregated here in great numbers in spring and fall. We were well out and preferred to stay on the island than to row over to the main land. After supper I told Henry that I had never slept on any of these islands in duck time, and if he did not object we would not light our night fire until after dark, so that we could see the ducks come in. It was about half an hour before sundown, and some of the flocks began to arrive, and such a babel! The heavy mallards would come in, back wind with their wings and drop down with a splash, and then the loud-voiced females would raise a din. Swift bluebills and butterballs would rush over our heads, circle around and settle down. The swiftest of all ducks, the little green-winged teal, would suddenly appear from nowhere and splash down into the water without circling about, coming into it much as a

* We could not quote from memory. The sense of the thing had been retained, but the words would not come at call. What we were skirmishing around was the speech of Rosaline, in "Love's Labour's Lost," when she says:

"A jest's prosperity lies in the ear
Of him who hears it, never in the tongue
Of him that makes it."

A man with a keen sense of humor meets this truth—oh, so often!

stone would. The high-voiced widgeon, the bass of the frogs, the heavy quack of the mallard and the lighter one of the bluewing, which sounded like an echo, and the curious *burr!* of the bluebill made a concert to be remembered. The pond might have covered three acres, and 2,000 ducks, at least, rested on it that night. We did not try to shoot any, for we thought we could get what we wanted any time. After dark we lighted our fire, but it did not seem to disturb the ducks. Our talk was not heard in the racket they kept up, and we turned in on our bed of leaves. Frank said that several birds or flocks flew around our fire in the night, but Henry and I slept too soundly to hear them. Such life was new to Frank, and he didn't sleep much.

A rifle shot awoke me in the morning and there was a thundering sound of rising ducks. Henry had killed a mallard, and then the problem was to get the bird. The shore was soft black mud, deep and treacherous, and although the duck was not over 30ft. away, and stone dead, it was no easy matter to get it. Frank and I advised him not to attempt it, but he vowed he'd have that duck "if it took a leg." He began to gather driftwood, brush and limbs and threw them in to make a bridge, and as he was in earnest we helped him. When he thought his bridge was long enough, so that from its end he could reach the duck with a pole, he started. I whispered to Frank a caution not to speak to him, and we watched. The passage was a success; he reached his pole for the duck, something rolled and he was floundering in the mud. There was only a couple of inches of water where he was, and as he struggled he sank to his waist. We could not tell how much further he might sink if he struggled.

I called to him: "Don't move or you may go deeper; keep perfectly still and we'll get you out. Is there a grapevine on this island?"

"Not a vine," said he, cool as a cucumber. "Take your time, I won't stir."

He was over 20ft. from sound footing, and we cut a sapling and shoved the end to him and pulled until he could hold on no longer. He let go so suddenly that we sat down. He had bent forward so that the mud covered his breast. Frank began to fear for his brother, but I had another plan. I cut a green cottonwood, or perhaps it was an aspen, which had a fork at about 25ft., and these two limbs were of an inch or more in diameter. These limbs I crossed and twisted, making a loop big enough to go over Henry's shoulders, and lashed them firmly together with strips of bark at several points. With this around him and the grip of his hands, together with the use of his legs, we pulled him to solid ground, the mud being plowed up by his shirt collar so that his clothing was filled inside and out. I remained to get breakfast, while Frank went with Henry over to the cleaner waters of the sloo, where he washed himself and his clothes, while Frank returned for breakfast for himself and brother. When we reached him his garments were all hung in the sun, but he was shivering, for the morning was cool. Frank gave him his trousers and sat in his drawers, and I loaned a coat.

After he got some hot coffee and breakfast he said: "The hogs gobbled all our fish last night, Frank's big pike and all," and we found it to be so. Hogs' tracks were numerous in and about our pool and portions of fish were scattered about. Frank said: "Well, I'll be durned! That pike would weigh about 40lbs., and was bigger than one Bill Patterson shot up in Grant River last fall."

"Yes," said Henry, "Bill's fish weighed 11½lbs. on Mallet's scales; I saw it weighed, and if yours weighed 40lbs. there was a little difference of 28½lbs.; not much, to be sure, but still a difference."

"Don't you think my fish was as big as Bill's?"

"Not quite," said Henry. "I think your pike would weigh nearly as much as his if you fed him half a dozen pounds of shot when no one was looking."

Frank appealed to me. I replied: "I am not as good a judge of the weights of fish as Henry is, and I didn't see Bill Patterson's pike. I am of the opinion, however, that if your fish was bigger than Bill's the scales would show that it weighed more, but as the hogs have eaten it there is nothing left but the memory of it, and you know that we can't weigh memory. Still I remember thinking at the time that your fish would go full 20lbs. if he had been left to grow for a few years."

"I see," said Frank; "if Henry was as wise as Daniel Webster he would know just as much. All right! We are three great sportsmen and have fished one day and shot a duck the next morning, and have only our memories to show for it. Not a scale nor a feather; 'though I s'pose Henry will count the duck he shot and the duck he had in the mud as two ducks, and both were lost. No; I'll be durned if we don't take home that mallard, for Henry said he'd get it or lose a leg. How's that, Henry, which leg will we take off if you don't get that duck?"

Henry was busy getting into his half-dried clothes and said: "Frank, you may have that duck."

We fished that day and shot ducks with my rifle in the evening, slept out next night and took home in the morning eight mallards and all the pike and crappies we could carry.

I regret that we cannot print portraits of these boys. I have daguerreotypes of them, taken in 1860, sent me by their younger brother, Carlos E. Neaville, now living at Brodhead, Wis. The photo-engraver says that they cannot be reproduced with any effect because of the lack of shadows. Henry was about 5ft. 6in., broad-shouldered; a long, oval face, with a profuse head of dark hair which came down to a point in the middle of his forehead. Frank, the younger, was larger. His forehead was broader and his ears were lower. What I mean by this is that my frequent comment on the picture of a man is: "There is much (or little) of his head above his ears." Just what ethnological value this has let others say. Frank did show evidences of the mercantile instinct, for Judge Seaton, now living in Potosi, speaks highly of him as an employee of his during the few years that he was a merchant. But Henry, he was the companionable fellow, no business for him if he could help it. He and I were alike in this respect. The woods and the streams were good enough for us, and the habits of their denizens were of more importance than dollars. What poet has ever written in praise of the slave to lucre? There I go again, off the track. A dollar is a big thing when you don't own one, it's like the boy who said, "Salt makes your potatoes taste bad when you don't put any on."

Once a drunken miner lost his purse in the streets of Potosi and Frank found Henry John Nicholas, Frank and I were talking about it with the old postmaster, Mr. Kaltenbach, when the miner came up asking if anyone had found his money. "Yes," said Henry, "we found it. How much was there in it?" The man called Henry a thief and struck him. About the same instant Frank handed the miner one under the left jaw that paralyzed him. We took the man into Jo. Hall's livery stable and it took Dr. Gibson over an hour to bring him around. Henry scared Frank into thinking he had killed a man and Frank went over to Constable Darcy and gave himself up.

As the summer waned and the first chill days of September approached Frank asked me: "Did you ever eat a pawpaw?"

"No, what is a pawpaw?"

"They are a fine fruit and grow on a small tree. They are shaped like a cucumber and are like custard. There is a pawpaw grove down by the river. They'll be ripe now in a few days and we'll make up a party and go coon hunting. Coons like 'em and you can always start one in the pawpaws when they're ripe."

I had seen the trees when out after wild plums, which were plenty in that part of Wisconsin, and were large and excellent, but the pawpaws were merely wondered at and passed. I think there was a dozen in our party when we started for coons on a moonlight night. Except Frank and Henry, Charley Guyon, John Clark and Bill Patterson, the names are forgotten. Half a dozen dogs, some of no particular breed and others that seemed to be of all breeds mixed without regard to proportion, went along as a necessary part of the outfit.

I tasted my first pawpaw, but have yet to taste the second one. The others ate them with a relish. All I remember is that the fruit was shaped something like a banana, but shorter; and had the taste of a raw potato ground into a paste; its seeds were as large as a lima bean. Of course I might learn to like them, but Potosi boys acquired the taste in infancy.

Soon the dogs remarked that a coon had gone off, because it did not care to eat pawpaws while such a noisy crowd invaded the woods; for in hunting coons the more noise the better, as it puts them afoot, while if you are still they will squat on a limb at your approach. The coon soon treed and hid so that it could not be shot. John Clark's axe on one side and Henry Neaville's on the other soon dropped the tree and the dogs made a rush. We had a fire started to light up the conflict, but couldn't see a thing in that tree top but a mass of fighting dogs. Cheers and yells from the men encouraged the dogs. "Go in, Tige!" "Shake him up, Skip!" "Hang to him, Buster!" and such cries cheered on the dogs. "There's two of 'em!" yelled John Clark, as two knots of dogs were seen, but it turned out that one knot was merely a little scrapping of a couple of dogs among themselves, perhaps occasioned by one dog's jealousy of the other fellow. The coon broke away and ran up a limb, and a rifle ball dropped him. And then such a row! Every dog had hold of him, and a man had hold of every dog's tail, and each dog got a kick in the ribs to admonish him that a fallen foe should be respected. I thought of the old story: "Never strike a man when he is down," said Mulcahy. "Never," replied O'Hooligan; "just sock the boots to him."

The coon was not badly mangled after all this, the dogs were chewed up much worse. It reminded me of Corny Lannigan, one of my father's ship carpenters, when father said to him one morning: "Cornelius, you must have had some trouble last night; your eyes are blacked and your nose is all plastered over."

"Yes, Captain," said Corny, "there was a little misunderstanding, but you ought to go up to the hospital and see the other fellow," and I then remembered reading that the great General, Pyrrhus, once said: "Another such a victory and I am ruined."

Another coon was started, and was finally found in a tree by the water whose base had been so washed that it leaned out over Grant River. After lighting a fire and consulting as to the mode of attack, Frank offered to go up the leaning tree and shake the coon off, while the dogs were to be held so as to see him drop, and then be loosed to tackle him in the water. The plan worked well. The coon dropped at the first shake, and so did Frank. The dogs rushed in, but no man dared shoot, and after a short fight in the water and on the other shore the dogs came back and we went home.

"I tell you," said John Clark, "it takes an almighty good dog to whip an old he coon, and not one in a thousand can do it. Sometimes a little she coon will give a dozen such ornery dogs as we've got a good tussle and get away."

"Look a-here, John Clark," said Charley Guyon to his brother-in-law, "do you call my dog ornery?"* And so we talked on the way home.

In sketch No. XVI. I told how Frank and Henry went out with the Second Wisconsin Infantry, and both were killed in Virginia.

"Sound, sound the clarion, fill the fife!
To all the sensual world proclaim,
One crowded hour of glorious life
Is worth an age without a name."

FRED MATHER.

* "Ornery" is Wisconsinese for "ordinary," but has no such meaning. It implies baseness, it is a term of reproach. An "ornery cuss" means a low-down fellow, and an "ornery dog" is one of no possible account. If a man in New York should describe me as an ordinary man, he would hit it right; an every-day sort of man, not distinguished for anything in particular; but if a Wisconsin man stigmatizes you as "ornery" he means another thing, and if he is not a corn-fed fellow you should "let go your left and follow it up with your right."

Will the correspondent who wrote of the Mather Wheelmen kindly send us his address.

A Stray Shinplaster

Comes to us once in a while for a copy of "Game Laws in Brief;" but shinplasters nowadays are scarcer than Moose in New York; and 25 cents in postage stamps will do just as well.

YE SUNBERRYE FYSHER.

"Ye Sunberrye Fysher" appeared in London *Punch* about 1875. We reprint it from a copy supplied by Mr. Mather, who writes: "He was a mighty good fellow, I believe, and I'd rather fish with him than with those who sneer at him. He had a mine of pleasure in his outfit which is unknown to the man who says: 'I can catch just as many trout with an alder pole as the dude can with a $10 pole.' These fellows always call a fine rod a pole."

Ye Sunberrye fysher uprose with ye day,
When ye meadows were sweet with ye smell,
And ye hedges were white with gossamere veils,
And ye gardens were livelie with slugs and with snails,
And ye birds did sing, and ye fyshe did leap,
And ye river was oilie with too much sleep;
Till glorious and golden the sun uprist,
And gentlie ye cheek of ye water kissed,
Which, modest and coy from its bed of rushes,
Sent forth a mist to hide its blushes,
A cold, gray mist; but it would not do,
For ye sun kissed ye mist and ye river too;
And crimson and rosie ye stream flowed on,
Crimson and rosie ye gray mist shone,
Redder and redder, higher and higher,
As if he had set ye Thames on fire.

Ye Sunberrye fysher to fyshe begins
For every fish that has scales and fins;
Nothing to him is out of its place—
Perch, eel, barbel, or bream, or dace,
Big-headed chub with crimson tails,
Red-eyed roach with their silverie scales,
Ravenous pike of fabulous weight,
Bleak and gudgeon, and minnow for bait;
Even a trout he would not despise,
If onlie a trout would happen to rise—
About as likelie, truth to declare,
As to rise a sturgeon in Sunberrye weir.

Ye Sunberrye fysher has all kinds of hooks,
In all kinds of boxes, in all kinds of books—
Limerick, Kendal, Kirby and Hammond—
All kinds of names by which fyshes are gammoned;
Broad and narrow, and oval, and round,
All sorts of shapes which ever were found.

Ye Sunberrye fysher has bait, live and dead,
Pellets of paste and pellets of bread;
Milk-white gentles, wriggling and fat,
Worms black and red, with tails spiral and flat,
Swivels and trimmers, and spinners and gorge,
Glass minnows, brass minnows, fresh from the forge,
And spoon bait, of course, which—I mean no offense—
Ye fysher provides without any expense.

Ye Sunberrye fysher has flies of all feathers,
For all sorts of seasons, in all sorts of weathers:
Flies when ye springtime is blusterie and showerie,
Flies when ye summer is grassie and bowerie,
Flies when ye autumn is golden and granie,
For hot weather, cold weather, mistie or rainie;
Red-spinner, Palmer, black-peacock and gray,
Yellow-dun, golden-dun, March-brown, and May,
Sand-fly and stone-fly, and alder and gnat,
Black midge and marlow bug—all round his hat.

Ye Sunberrye fysher has rods not a few,
Rods with a joint and rods with a screw,
Short top and stiff top, to spin and to troll,
Hollow butts, solid butts—rods in ye whole;
Twisted lines, spun lines, of hair, silk and twine,
Hair and gut casting lines, tapering and fine;
Double reels, single reels, quill float and cork.
Ye Sunberrye fysher is up to his work.

Ye Sunberrye fysher arose with ye day,
He fyshed and he fyshed when ye morning was gray;
He fyshed and he fyshed when ye noontide was frying,
He fyshed and he fyshed when ye evening was dying;
He bobbed and he jerked, he spun and he threw,
He tryed all ye dodges as ever he knew;
He fyshed till ye dews on ye river did fall—
Ye Sunberrye fysher caught nothing at all.

SMELT FISHING IN BOSTON HARBOR.

BOSTON, Oct. 30.—*Editor Forest and Stream:* Nowadays one meets a good many men with a short cane rod, a small basket, a pair of rubber boots and an old suit of clothes, and it's long odds that man is going or has been smelt fishing somewhere about Boston harbor, and for the purposes of that kind of sport all the waters adjacent to Dorchester, Quincy, Hull, Hingham and Nantasket come under the head of Boston harbor. It is great sport too, when smelt are plenty, as has been the case this season, and for several weeks the waters named have been thick with boats containing all the way from one to four fishermen. A friend told me that one day last week there were seventy boats out on the waters of Dorchester Bay from Thompson's Island up to the mouth of the Neponset River, and that same day that friend and a companion caught thirty-one dozen of the dainty little fish. A piece of luck came to me the other day in the shape of an invitation from Com. John N. Roberts to go down to his place on Peddick's Island, opposite Hull, and have a try at the smelts. I had been there before and knew all the charms of the place as well as the lavish hospitality of the owner.

Mr. Roberts is a sportsman from way back, an ex-commodore of the South Boston Yacht Club, a member of the Fish and Game Protective Association, and for many years chairman of the committee on the enforcement of the fish laws, in which he did excellent work, as I know, for I served with him. He was the first to obtain evidence and prosecute a party for illegally seining smelts, and it was his promptness in following up that case that put a stop to the practice for several years.

Formerly the Commodore designated his place "the shanty," but now it will have to be called "the cottage," in consequence of its enlarged and improved appearance. A large addition has been put on; the kitchen, dining room and chambers are models of neatness, and the beds are so comfortable that one is reluctant to leave them at the summons of the alarm clock, which was set for 4 o'clock the days I was there, as the Commodore is always on the fishing grounds with anchors down and everything ready for business by the time the sun is seen coming up out of the Atlantic in the vicinity of Minot's Light, as it looks to us. But to the fishing. There seemed

to be a scarcity of smelts just then. To be sure, we got what I was ready to call fair fishing, but it was tame compared to what they had enjoyed a week before. In fact, Capt. Seth Hartford, the Commodore's companion at the cottage, said it was very poor. That same Capt. Hartford, being a Provincetown man, is also an inbred fisherman and a very handy man to have around a camp. The Commodore went to the city to join a party of friends on a coon hunt in Middleboro, while I remained with Capt. Seth, who was always ready to go fishing whenever I desired. I made two trips to the island. We had all sorts of weather—too rough to go out one day and beautifully warm and pleasant the next—and altogether I put in some very enjoyable days; got some fish every time we went out; heard with satisfaction the Commodore's story of the coon hunt when they didn't get any coons, and came home with a firm determination to go again the next time I was asked. WILLIAM B. SMART.

VERMONT FISH COMMISSION.

COMMISSIONERS John W. Titcomb and Horace W. Bailey have submitted to the Vermont Legislature the thirteenth biennial report, ending with June 30, 1896. The document is illustrated with a set of the colored portraits of fishes prepared by Mr. F. S Denton, under the direction of Dr. Tarleton H. Bean, for the Pennsylvania Fish Commission; the plates were here supplied by the Vermont Fish and Game League.

The work of the hatchery shows for 1895 a planting of 195,000 brook trout. 210,000 lake trout. 35,000 rainbow trout; and for 1896 600,000 brook trout, 285,000 lake trout, 10,000 Von Behr trout.

In the spring of 1895 Hon. A. W. Hyde, of Sudbury, seined from Hinkum Pond 2.844 small-mouthed black bass and placed them in Lake Hortonia, with a loss of 68 fish. Of the 2,776 planted in good order one-third were 3 to 6in. long, one-third 6 to 8in. long, one-sixth 8 to 10in. long, one-sixth somewhat larger. He also took with rod and line 17 adult bass weighing from 1½ to 2lbs., and planted in the larger lake. From Lake Champlain he purchased of a fisherman, under authority of the Commissioners, 111 adult bass and transported to Lake Hortonia. In the spring of 1896 Mr. Hyde took 506 bass from Hinkum, from 4 to 10in. in length, and planted them in Lake Hortonia. Hinkum Pond, the source of supply, was formerly inhabited by bullheads and perch. It was subsequently stocked with bass some years ago, but being of too small area for bass, the latter ate the smaller fish, exhausting their source of supply, and do not now grow to full size in the smaller pond. Hinkum Pond is for this reason used as a source of supply for stocking other waters. In the autumn of 1895 Ralph Garfield and others secured about 25 black bass from Wolcott Pond and planted them in Big Pond. These fish averaged about 1lb. in weight.

On May 27, 1896, F. H. Crandall, superintendent of the Burlington City Water Works, obtained from the Winooski River and planted in the city reservoir 38 wall-eyed pike.

April 26, 1895, Hon. Ira R. Allen and others obtained from Lake Champlain 110 wall-eyed pike, which they placed in Lake Bomoseen. In May, 1896, the same parties placed 58 wall-eyed pike in Lake Bomoseen from the same source.

The citizens of Berkshire and Franklin, being interested in the stocking of Franklin Pond, obtained from Lake Champlain adult wall-eyed pike to the number of 10 in the spring of 1895, and 52 in the spring of 1896.

With respect to other fishes handled by the Commission we quote from the report.

A table is given which shows fines and costs as paid by the offenders amount to about $2,000, with many cases pending in the county court. Violations are not increasing in number, although the table may indicate that more offenders have been brought to justice the past term than heretofore.

The case against Adalbert Bundy, who was arrested by Fish Warden Kipp with 244 short trout, has attracted considerable attention from the fact that Bundy was employed by several citizens of Hyde Park, who owned a private pond and wished to stock it by taking trout from the public waters of the State. The Commissioners have always maintained that, inasmuch as it was not lawful to use fish propagated at the State hatchery for the purpose of stocking private waters, and inasmuch as it was also unlawful for individuals to take fish less than 6in. long from public waters of the State, it is not proper or lawful to permit the taking of trout except of legal length and by lawful methods for the purpose of stocking private waters.

Referring to the case of State vs. Johnson and Waite, one justice refused to try the case. The accused plead guilty to catching 96 trout under 6in. in length and received a fine of only $5 and costs, or about one-hundredth part of maximum penalty. There were no extenuating circumstances in the case. The trial justice made the remark in court that "it is a very foolish law, but so long as it is on the statutes I suppose I must take notice of it."

The 6in. Trout Law.

The main argument in favor of a law placing a limit on trout as to length is in the fact that by thus protecting the small trout they have at least one opportunity to spawn and reproduce. This law is well observed by sportsmen throughout the State, although there are communities where sentiment is very generally opposed to the law, and where fishermen who fish for numbers rather than size, and regardless of sport, utterly disregard the law. It has its objectionable features in that the careless fisherman, not in sympathy with the law, will maintain that a small trout, once hooked, almost invariably dies. That this statement is not true may be substantiated by the fact that several thousand short trout were caught for stocking the breeding ponds at Roxbury, with no noticeable mortality as a result. Nearly all the New England States have followed the example of Vermont in placing a statutory limit upon the trout to be legally caught.

There has been a misunderstanding among many fishermen who were of the impression that it is legal to take trout of less than 6in. in length from public waters for stocking private waters. In cases of this kind the owners of the private waters have been allowed to restore the short trout to the public waters again without further action.

It is a notable fact that in communities where public sentiment upholds the law better fishing prevails than in more rural communities, where the fishing should be the best.

Sawdust.

It always has seemed strange that the farmers should oppose legislation against the pollution of streams, inasmuch as they individually suffer more than any other class of citizens. There are instances in various parts of the State where the riparian owners have secured injunctions against the pollution of the streams adjacent to their lands with sawdust during high water. A notable instance of the utility of such an injunction may be mentioned in connection with Moose River. This stream had been practically depleted of trout, but since the mill owners have begun to take care of their sawdust the trout have steadily increased from natural propagation with but little assistance from artificial propagation, and in spite of the fact that the stream has been fished almost daily during the open season. It is a notable fact that large mill owners, or those who operate most extensively, take care of their sawdust and refuse either by burning it or selling it. It is the smaller mills that do the most damage to the trout streams. [The Commission refuses to supply trout to sawdust-plagued streams.]

Landlocked Salmon.

This valuable variety of food and game fishes is not known to be indigenous to any of the lakes in Vermont. It is fast becoming one of the most popular varieties in Maine and New Hampshire, both as a food and game fish. Some years ago Lake Morey was stocked with them by the United States Fish Commission, and a few of good size have been caught there the past two seasons. In all probability the larger part of the salmon from the plants above referred to have escaped into ponds below Lake Morey, and thence into the Connecticut, and possibly some of them have returned into the ocean. In order to have some of the inland lakes of Vermont stocked with this valuable variety, Peacham Pond, or Onion River Pond, as it is properly named, has been stocked and closed by the Commissioners, the fish having been received from the United States Fish Commission and turned over to the State Commission before being deposited in the lake. It is designed that this lake shall be used as a source of supply for stocking other waters, if the first deposit proves a success. The United States Fish Commission will obtain spawn from the fish when mature for further work of propagation. It is not contemplated to keep Peacham Pond permanently closed, but simply long enough to give the salmon a foothold in the lake. After that time the lake will be restocked from time to time, by returning to it annually a portion of the fish produced from eggs previously taken from it and artificially hatched.

While these fish are naturally river spawners, it has been shown that they will spawn in lakes supplied by streams too small to admit of their use as spawning grounds. In such cases the salmon spawn on gravelly bottoms in the lake, very much like the lake trout. In such cases they select a spot where a spring bubbles up through the gravel. The brook trout of Caspian Lake have the same habit, as well as the brook trout of many other lakes not so well known.

In considering the suitability of our lakes for the introduction of the salmon, the question of fish food is of first importance, as it is in the attempt to increase the product of any water by the introduction of any other variety of fish. Many of our lakes are now well stocked with minnows. These make good food for the *salmonidæ*, but not so valuable as the smelt. State Fishculturist A. N. Cheney, of New York, recommends the round whitefish, called in New York frost fish.

Lake Trout in Lake Champlain.

To the older inhabitants of Vermont it will be recalled that Lake Champlain was once inhabited by lake trout, commonly called longe, and also Atlantic salmon, which entered Lake Champlain by way of the St. Lawrence and Richelieu rivers during their migratory period for the purpose of spawning, also that salmon entered the various rivers and tributaries to spawn. At that period the waters of the lake were undoubtedly colder than at present, and the condition of the rivers in which the fish spawned was also better. The water was not polluted with sawdust refuse or other sewerage; although the conditions have been much changed, the experiment has been made to restock the lake with lake trout, and in place of the Atlantic salmon, which is now prevented from entering the lake by dams and other obstructions, landlocked salmon have been introduced. Whether these fish will thrive and multiply is entirely an experimental question, which only time will decide. An occasional salmon has been taken in Lake Champlain. About one mile from Port Kent, N. Y., a salmon was taken which weighed about 12½lbs.; it was taken with a spear probably near the mouth of the Au Sable River. Hon. A. N. Cheney, fishculturist of New York, states that the fish above mentioned was probably a sea salmon from fry planted on the New York side of the lake; and the New York Fish Commissioner also states that a number of salmon were captured near Plattsburg, N. Y. He also makes mention of salmon being taken weighing 20lbs. The United States Fish Commission in 1894 planted 9,770 fingerling salmon under the direction of Mr. Cheney in some of the streams on the New York side of the lake. A lake trout weighing 15lbs. was taken on a smelt hook in Shelburne Bay, in April, 1895. Other trout are said to have been captured, of smaller size, but the reports have not been verified. These facts go to show that fish of the salmon family can still live in Lake Champlain, but it has not yet been proven that they can reproduce in sufficient numbers to make stocking of the lake a success. During the year 1895 the United States Fish Commission sent two shipments of fingerling steelhead trout to Lake Champlain from the station at St. Johnsbury. One consignment was planted in the vicinity of Isle La Motte, the other consignment around the reef off Colchester Point and Stave Island. The steelhead trout is indigenous to the waters of California, and resembles very much the salmon trout. It is believed that this variety will stand warmer water than ordinary lake trout. The steelheads above referred to were fingerlings of good size, and well able to take care of themselves.

The Rainbow Trout or California Trout.

Salmo irideus has been distributed to some extent with very satisfactory results. The Commissioners do not advise stocking natural trout waters with rainbow trout, but rather select streams which were formerly the natural haunt of the common brook trout, but in which the latter no longer thrives, owing to changed conditions which result in a warmer temperature of water than is agreeable to the speckled trout.

The lower and deeper waters of some of the large trout streams prove very acceptable to the rainbow variety. The cutting off of the forests has resulted in marked changes in the nature of many streams, and the rainbow may be the means of preserving the fishing in some of these streams. The following is an extract from a letter showing what the rainbow has done in four years:

"RANDOLPH, Vt., Aug. 24, 1896.—The rainbow trout that I put into Mad River four years ago have been heard from this season. I have heard of about twenty being caught, weighing from about 2 to 2½lbs. each.

J. E. ELDRIDGE."

Black Bass.

The law protecting black bass until June 15 was framed with especial reference to the spawning season of this fish. The bass protects its spawning beds and afterward its young. They do not leave their spawning beds in many instances before July 1. During the period of spawning the bass do not usually eat, but they are easily captured, because they will seize baited hooks dropped on their beds or dragged slowly over them, in an evident attempt to protect the latter.

As a matter of information, the following data are given respecting the size and weight of bass: A bass 10in. long weighs about 10oz.; 11in. long, 12oz.; 12½in. long, 14oz.; 17in. long, 3lbs. 1oz.; 19in. long, 4lbs. 2oz.

The figures will of course vary with the condition of the fish and in different waters, some bass being more stocky than others.

Pound Netting Disaster.

ASBURY PARK, N. J.—*Editor Forest and Stream:* Ruin to some, financial embarrassment to all, is the story of the pound fishery of our coast for the season of 1896. Unheeding the advice of men of experience and opposing all law looking to the better condition of affairs, these men have persisted in their exterminating course until Nemesis has overtaken their affairs. Men who have heretofore been wealthy now stand with property assigned, or so badly in debt that years of hard work will be essential to their betterment of condition. Unmindful of the fact that fishes like chickens come home to roost, they have persisted in stripping the seas by their enormous nets of the early spawn-bearing fish, and against the warning of the men in the same pursuit off the coast of the Eastern States, they have used nets of so small a mesh that in the autumn the fingerlings of the season's hatching have been used as bait to entrap the fish of larger size. The extermination has been of the most pronounced type. In consequence the crews of the pounds have been discharged without their season's pay and have just cause to lament their employers' folly. Added to this condition of affairs the late heavy storms demolished every pound on the coast, causing a loss of at least $100,000 to the syndicate, for be it known the entire system of pound fishery of our coast is controlled by a trust, who fish and dictate terms to our legislators at their will. LEONARD HULIT.

A Trout Netter Fined.

DR. WILLETT KIDD, the fish and game protector, won another victory at Chester yesterday, and recovered the full penalty. The case was that of Stephen Garrison, an old guide, of Greenwood Lake, who was charged with netting a trout stream, Seeley's Creek. Garrison must pay $100, the usual penalty for such violation, besides costs of court. The waters of Seeley's Creek have been netted again and again by reckless violators along its banks. Dr. Kidd's victory will have a salutary effect upon them.—*Newburgh (N. Y.) Journal.*

The Kennel.

FIXTURES

BENCH SHOWS

Dec. 1 to 4.—City of the Straits Kennel Club's local show, Detriot, Mich. R. H. Roberts, Sec'y.

Dec. 8 to 11.—Augusta, Ga.—Georgia Poultry and Pet Stock Association. J. W. Killingsworth, Sec'y.

Dec. 15 to 18.—Central Michigan Poultry and Pet Stock Association's show, Lansing, Mich. C. H. Crane, Sec'y.

1897.

Feb. 2 to 5.—New England Kennel Club's annual show, Boston.

FIELD TRIALS.

Nov. 16.—National Fox Hunting Association's third annual trials, Bardstown, Ky. F. J. Hagan, Sec'y.

Nov. 16.—Newton, N. C.—E. F. T. Club's trials. S. C. Bradley, Sec'y, Greenfield Hill, Conn.

Nov. 17.—Chatham, Ont.—International Field Trial Club's trials. W. B. Wells, Sec'y, Chatham, Ont.

Nov. 20.—Thomasville, N. C.—Philadelphia Kennel Club's trials. Dr. Alexander Glass, Sec'y, 2125 Sansom street, Philadelphia.

Nov. 23.—Newton, N. C.—U. S. F. T. Club's fall trials. W. B. Stafford, Sec'y.

Dec. 14.—Athens, Ala.—Dixie Red Fox Club's second annual trials J. H. Wallace, Sec'y, Huntsville, Ala.

1897.

Jan. 11.—Tupela, Miss.—Continental Field Trial Club's quail trials. P. T. Madison, Sec'y.

Jan. 18.—West Point, Miss.—U. S. F. T. C. winter trials. W. B. Stafford, Sec'y, Trenton, Tenn.

Nov. 8.—Carlisle, Ind.—Union Field Trials Club second annual trials. P. T. Madison, Sec'y, Indianapolis, Ind.

The Brooklyn Show.

MR. JAMES MORTIMER writes us that the first annual dog show of the Metropolitan Kennel Club, to be held in the old 13th Regiment Armory on Nov. 24 to 26, will have 140 classes provided, of which the open classes will have three prizes, $8, $4 and $2; while the challenge classes will have a prize of $8 to first, and a prize of $10 will be given to the best exhibit of four of a number of the more important breeds. Nearly all the specialty clubs have taken an active part in the contribution of cups and medals.

The judges are as follows, namely: Mastiffs and bloodhounds, Mr. H. W. Lacy, Boston; Great Danes and poodles, Mr. Charles D. Bernheimer, New York; St. Bernards and Newfoundlands, Mr. Alexander McKenzie Hughes, Brooklyn; Russian wolfhounds, deerhounds and greyhounds, Mr. H. W. Huntington, Brooklyn; pointers, Mr. Chas. Heath, Newark, N. J.; English foxhounds, English setters, Irish

setters and Gordon setters, Mr. John Brett, Closter, N. J.; Irish water spaniels, Clumber, field and cocker spaniels, Mr. A. Clinton Wilmerding, New York; beagles and American foxhounds, Mr. Herman F. Schellhass, Brooklyn; collies and sheep dogs, Mr. Jas. Watson, New York; bull dogs, Mr. E. K. Austin, New York; Boston terriers, Mr. C. F. Clarkson, New York; dachshunde, Mr. G. Muss-Arnolt, Tuckahoe, N. Y.; pugs, Yorkshire terriers, toy terriers, toy spaniels, Italian greyhounds and schipperkes, Mr. T. Farrer Rackham, East Orange, N. J.; bull terriers, fox terriers, Irish terriers, Scottish, Bedlington, Skye, Dandie Dinmont and Black and Tan terriers, Mr. T. S. Bellin, Albany, N. Y.

The club will open classes for any recognized breed of dogs not already classified in the premium list, provided there be not less than five entries of such breed. It will also make novice classes for any breed should there be three or more entries, and will divide by sex any breed for which but one class has been made, provided there be not less than five entries of each sex. The entry fee is $2. Entries close Nov. 16 with James Mortimer, Superintendent, Hempstead, L. I., to whom all checks must be made payable.

NEW ENGLAND BEAGLE CLUB'S TRIALS.

THE New England Beagle Club held its fourth annual field trials at Oxford, Mass., Nov. 2 to 6, and the meet was one of the most successful ever held in Massachusetts. The hotel accommodations and the hot lunches served in the field were all that could be desired. The beagles were well provided for, and each owner had a box stall for his hounds, so that it was not necessary to keep them on chain.

The judges were Charles Quynn and Bradford S. Turpin. They worked hard, as all judges must in such a country as Oxford, where the cover is heavy and the rabbits go quickly to earth. The awards were well received.

The entries were of a high order of merit, and the 13in. All-Age class was a particularly fine one. Most of the All-Age winners are well known from their work in former trials. The Futurity and Derby winners are all promising hounds and bred from the best field trial stock.

Among those present at the meet were: H. S. Joslin, O. F. Joslin, Geo. Appleby, Oxford, Mass.; Wm. Saxby, Ilion, N. Y.; Thos. Shallcross, Robert Hindle, Jr., Providence, R. I.; W. S. Clark, Linden, Mass.; C. J. Prouty, Scituate, Mass.; H. B. Tallman, Greene, R. I.; Herbert Merriam, Weston, Mass.; C. W. Quynn, Frederick, Md.; Geo. F. Reed, Barton, Vt.; G. A. Clark, Lowell, Mass.; Geo. E. Williams, Jr., Danvers, Mass.; Guy Whidden, A. D. Fiske, Worcester, Mass.; A. H. Morse, Quinnebaug, Conn.; H. W. Lacy, Boston, Mass.; E. C. Clark, Bradford S. Turpin, Roxbury, Mass.

The officers of the club were present throughout the week and did much to make the meet the success it was.

Monday.

The day was clear, but a stiff wind interfered with the sport. The judges measured the entries in the morning, and transferred Dixie R. to Class B and Drummer Boy to Class A. The Derby was the first stake run, and all the entries filled except Minnie and Whaler.

The Derby—13in. and Under.

First Series.

In the first series George F. Reed's b., w. and t. bitch Snifter R. D. (Wanderer—Triumph), handler, owner, ran with Mrs. A. H. Morse's b., w. and t. bitch Ida Novice (Clyde—Lady Novice), handler, A. H. Morse.

Wm. Saxby's w., b. and t. bitch Dime's Dolly (Clyde—Dime), handler, owner, with Awashonk Kennels' blue ticked bitch Trilless (Laick—Sweet Fern), handler, Thos. Shallcross.

W. E. Deane's w., b. and t. bitch Topsy Glenwood (Rove—Wenonah), handler, Thos. Shallcross, was to run with Howard Almy's b., w. and t. dog Clarionet (Clarion of Glenrose—Trill), but Clarionet failed to appear and was ruled out.

W. E. Deane's w., b. and t. dog Glenwood (Little Corporal—Frances), handler, Thos. Shallcross, drew the bye.

SNIFTER R. D.—IDA NOVICE.—They were put down in a brushy pasture on the Shepardson farm at 9:50. Neither was under control, and they were soon widely separated. Each holed a rabbit, and then with difficulty they were drawn together to a hot scent. Ida drove prettily, showing good nose and judgment, but Snifter would not hark, and took no part in the race. Up at 11.

DIME'S DOLLY—TRILLESS.—Cast off at 11:09 in a pasture. A rabbit was soon up and in the run Dolly caught two turns and Trill one. This rabbit was lost in a swamp, but another was soon afoot and Dolly drove well through the scrub oaks to a stone wall, leaving Trill far behind. Down 1 hour.

As Clarionet had not yet arrived, the bye was now run.

GLENWOOD.—Snifter was put down to run with him in the alder field near the Shepardson barn. Glenwood made a pretty run, but Snifter would not hark. Down 30 minutes.

The first brace of the 15in. Derby was next run and is reported below. This finished the field work for the day.

Annual Meeting.

President Joslin called the annual meeting to order at 8:15. Wm. Saxby, Ilion, N. Y., and H. F. Shellhass, Brooklyn, N. Y., were elected to membership. The election of officers resulted as follows: President, H. S Joslin; Vice-President, A. D. Fiske; Secretary-Treasurer, W. S. Clark; Executive Committee, Thos. Shallcross, C. J. Prouty. Adjourned.

Tuesday.

A fine hunting day. The Derby was finished and the All-Age 15in. class begun.

TOPSY GLENWOOD.—Clarionet, Topsy's running mate, was not at hand and was ruled out. Trilless was put down to run with Topsy. The latter was a babbler, very wild and unsteady, and Trilless was badly confused by her noisy rival. Down 30 minutes.

Second Series.

IDA NOVICE—GLENWOOD.—The race was a pretty one for some time. Then Glenwood took the back track in full cry and ruined his chances for winning. Down 25 minutes.

IDA NOVICE—DIME'S DOLLY.—Both were stylish, busy hunters, but Ida had the keener nose and was able to carry the trail where Dolly could not find it. A very pretty race in Ida's favor.

First prize was given to Ida Novice, second to Dime's Dolly, third to Trilless, and reserve to Glenwood. Ida also won A. D. Fiske's picture, "A Sporting Scene," and H. S. Joslin's pair of hunting boots, which were offered as special prizes.

The Derby—15 to 13in.

There were but three entries in the first series. George F. Reed's b., w. and t. bitch Scorcher (Wanderer—Triumph), handler, owner, ran with Awashonk Kennels' b., w. and t. dog Starlight (Zeno—Fanny Reed), handler, Thomas Shallcross.

H. S. Joslin's b., w. and t. dog Trick (Clyde—Lady Novice), handler, G. W. Appleby, drew the bye.

SCORCHER—STARLIGHT.—This brace ran several short, indecisive races, and were then put down one at a time and given a chance to show what they could do singly. Scorcher did not drive as well as Starlight, and was not under as good control.

TRICK.—Starlight was cast off with him, but was not quite as quick in catching a turn and was outfooted in a straight drive. Down 2 hours. Seven rabbits were run in this race.

First prize was given to Trick, second to Starlight, and third to Scorcher. W. S. Clark's special prize of a half dozen regulation bench chains was also won by Trick.

All-Age—15 to 13in.

The eight entries in this class ran in the first series as follows:

Geo. F. Reed's b., w. and t. bitch Nell R. (Ned—Haida), handler, owner, with Geo. A. Clark's cin. and w. dog Tweed (Jack—Fannie), handler, owner.

Awashonk Kennels' b., w. and t. dog Baronet (Daunter—Reckless), handler, Thos. Shallcross, with Wm. Saxby's b. tic. bitch Dime (Judge—Baby), handler, owner.

A. D. Fiske's w., b. and t. dog Phantom (Clyde—Brummy), handler, A. H. Morse, with H. S. Joslin's b. tic. dog Snyder III. (Snyder II.—Nancy), handler, Geo. Appleby.

Deane & Smith's b. tic. dog Drummer Boy (Rove—Wenonah), handler, Thos. Shallcross, with Geo. E. Williams, Jr.'s, w., b. and t. bitch Fannie (—— — ——), handler, owner.

NELL R.—TWEED.—The former was merry and stylish; the latter slow and indifferent. Three rabbits were run and Nell was an easy winner. Down at 2:27 and up at 4:20.

BARONET—DIME.—The latter won handily in a long chase. She was faster on a straight drive and quicker in catching the turn. Down at 4:29 and up at 4:55.

Wednesday.

A cloudy day and an excellent one for hunting.

PHANTOM—SNYDER III.—The latter was too slow for Phantom, and though true was outclassed. Down 30 minutes.

DRUMMER BOY—FANNIE.—Both were babblers and both ran heel during the race. Two rabbits were up and the beagles shifted from one to another. Fannie had the best of the heat, but was not thought good enough to go in the second series. Down 50 minutes.

Second Series.

BARONET—PHANTOM.—The first rabbit started by this brace was a "creeper," and could not be driven for any distance. The second, after running to a wall and being bolted, ran well and finally was put into the stone heap. The race was an even one, without advantage to either hound.

DIME—NELL R.—Both are snappy, quick workers, but Nell ran better than ever before, and won with something to spare. Down 24 minutes.

First prize was given to Nell R., second to Dime, third divided between Baronet and Phantom, and reserve given to Fannie. Nell R. also won a seven-shot revolver offered by W. E. Deane.

All-Age—13in. and Under.

But four entries in this stake filled, and in the first series Wm. Saxby's w., b. and t. bitch Bessie (Judge—Baby), handler, owner, ran with Awashonk Kennels' blue-ticked bitch Trilless (Laick—Sweet Fern), handler, Thos. Shallcross.

E. C. Cook's b., w. and t. bitch Dixie R. (—— — ——), handler, owner, with A. D. Fiske's w., b. and t. dog Blossom (Clyde—Brummy), handler, A. H. Morse.

BESSIE—TRILLESS.—The former was wild and under no control. After the rabbit was put up she used her eyes more than her nose. Trilless is a pretty little thing, and won the race without much difficulty.

DIXIE R.—BLOSSOM.—This brace ran a long, hard race, and finally drove the game to earth. Blossom was too fast for her competitor. Down 15 minutes.

Second Series.

DIXIE R.—TRILLESS.—This brace was put upon a rabbit which had been run to earth and dug out. Dixie gave a splendid exhibition of cold trailing, jumped the game, which had been given two minutes' law, and led in the longest race of the trials.

First prize was awarded to Blossom, second to Dixie R., third to Trilless, and reserve to Bessie. Two special prizes—Robert Hindle, Jr.'s, hunting coat and Henry Hanson's assorted package of Spratts dog medicines—were won by Blossom.

Champion Class—15 to 13in.

Geo. F. Reed's w., b. and t. bitch Nell R. (Ned—Haida), handler, owner, was the only entry. She made a pretty run and was awarded first prize and title of field champion.

Thursday.

A severe southeaster swept over New England and the rain put an end to field work for the day.

Friday.

A good hunting day. The Futurity stake was run off and proved very interesting. The trials were finished.

The Futurity.

There were six starters in the stake, and in the first series Joe Lewis's w., b. and t. dog Ringwood (Ringleader—Spinaway), handler, W. S. Clark, ran with A. D. Fiske's w., b. and t. dog Clyde II. (Clyde—Lady Novice), handler, A. H. Morse.

Awashonk Kennels' b., w. and t. dog Starlight (Zeno—Fannie Reed), handler, Thos. Shallcross, with George F. Reed's w., b. and t. bitch Scorcher (Wanderer—Triumph), handler, owner.

Geo. F. Reed's t. and w. bitch Mag R. (Zeno—Nell R.), handler, owner, with H. S. Joslin's b., w. and t. dog Trick (Clyde—Lady Novice), handler, Geo. Appleby.

RINGWOOD—CLYDE II.—They were an evenly matched brace in driving, but in hunting Clyde was the better. Down 35 minutes.

STARLIGHT—SCORCHER.—The latter ran in better form than he displayed at Hempstead, and won after a long, tiresome race. Six starts were made and five of the runs ended at the nearest burrow. The other gave an opportunity to judge the hounds, and Scorcher was found to be quicker on the turn and faster on a straight drive. Down 3 hours.

MAG R.—TRICK.—At first the former did some fast, beautiful work, while Trick was evidently having an off day and worked poorly. Then, at a loss, Mag grew tonguey and babbled here and there. Down 1 hour.

Second Series.

MAG R.—The judges thought it best to give Mag a chance to show what she could do alone. In a long race she drove prettily and holed her game. She was, however, too tonguey.

CLYDE II.—SCORCHER.—Scorcher's superior speed made him a winner over Clyde II., who is only 12in. in height. The little fellow ran well and in his proper class will make a good showing. Down 25 minutes.

STARLIGHT—TRICK.—The latter had the advantage in a long race, but neither hound did the best work of which he is capable.

SCORCHER—MAG R.—Merely a formal heat to comply with the rules.

First prize, $43.20, to Scorcher; second, $27, to Mag R.; third, $16.20, to Trick. To breeder of the winner, C. Staley Doub, $10.80; to N. E. B. C., $10.80. Total value of stake, $108.

Special Prizes.

Nell R. won $10 in gold offered by H. S. Joslin, and a box of cigars offered by Howard Almy, for best combination of speed and nose. She was also judged to be the most stylish worker, to have the best voice and to show the greatest sustained speed.

Wm. Saxby won the ribbon for most wonderful story told during the trials, with Geo. F. Reed, reserve.

Dixie R. won service of Baronet, offered by Awashonk Kennels for best trailer. She also took club special for best trailer.

Clyde and Blossom won the shipping crate offered by Thos. Shallcross for best brace of field beagles owned by one kennel.

Starlight won service of Harker, offered by Geo. F. Reed, for best marking his game to earth. He also carried off the gun case offered by Dawson & Co. for best 15in. beagle owned in Rhode Island.

Blossom won service of Laick's Roy, offered by C. O. Smith for best 13in. bitch.

Scorcher was judged to be the best starter, and Dime's Dolly the best Derby entry bred by owner. J. A. B.

UNION FIELD TRIALS CLUB'S TRIALS.

THERE were sixteen dogs entered in the All-Age stake, and thirteen started.

The winner of first, Awline Rex II. (Antonio—Columbia), owned by C. P. Mingst and handled by J. T. Mayfield, is a dog any sportsman ought to be proud of. His range and pace are first class. He uses good judgment in seeking birds, and very seldom comes in to handler. He maintains a uniform pace, is under good control. A great dog to go shooting over or win a field trial with.

Cracker Jack, placed second, is a liver-colored pointer (Lord of Rush—Cyclops), owned by J. L. Adams and handled by Blankenbaker. He hunted under a great disadvantage, owing to an accident to his foot. He, however, ran a game race.

Forzanda, black, white and tan, third, handled by J. H. Johnson, is a rapid worker; ranges and hunts with good judgment, but is somewhat inclined to do as he pleases.

Daisy Rip Rap ran a good race. She is a handsome pointer bitch of medium height, and very stylish on point. She was trained and handled by Tom Richards, and her owner, Mr. Richard Merrill, thought she deserved higher honors.

All-Age Stake.

Tuesday morning, about four miles from town, the first brace was called. Chance, an orange and white setter, owned by Mr. Churchill and handled by Mr. Blankenbaker, and Forzanda, described above, were put down in a big field. Chance started off at a gait which he very likely expected to maintain for a day at least. He is a pretty hunter and undoubtedly a good shooting dog. Forzanda ranged wide and fast, but not finding birds in 40 minutes they were taken up.

Anne of Abbotsford, black and white setter bitch, owned by Edw. A. Burdette and handled by Frank Richards, and Lady Peg II., liver and white pointer bitch, owned by Richard Merrill and handled by Tom Richards, were cast off in an open field heavy with ragweed. Both dogs showed good range and pace, but failed to find birds. Down 35 minutes.

Toney's Gale, black, white and tan English setter dog (Antonio—Nellie G.), J. H. Johnston, agent and handler, and Jos. Becker's black, white and tan English setter dog Mark, handled by Harvey, started out to try conclusions. Mark had cut his foot and did not go out at his accustomed pace, consequently Tony made rings around him. Tony went at an extraordinary pace, but was hard-headed. He started in by a false point, was lost from handler, and when discovered was hunting a subble quite a distance away. Brought in, he made two more false points. Mark's handler now called point in a gully thickly grown up with weeds. Tony pointed same bevy, and was steady to shot. Mark broke shot. Sent in direction of scattered birds, Tony pointed new covey; steady to shot. Tony pointed single. Brace ordered up. Down 35 minutes.

Norris T. Harris's black, white and tan bitch Bonnie Bell (Thiers—Lillie B.), handled by Blankenbaker, and C. F. Hartmetz's cream and white bitch Columbia (Gath's Mark—Queen Blade), were put down on scattered birds, and the spectators were treated to a sight worth going to see. It was point, back, steady to wing and shot, both

dogs demonstrating that they were well broken, but lacked pace and range to get in the money.

After lunch Cracker Jack and Daisy Rip Rap were launched forth as usual in a big field covered with ragweed. Both dogs hunted wide and fast, perhaps a little in favor of Jack. After quite a run the judges discovered Jack on a point with Daisy backing, and right here is where the owner of Daisy takes issue with this statement, he claiming that Daisy found and pointed and that Jack came up and stole the point, but spectators who were within a few yards of the dogs say that such was not the case. Birds were flushed, but not followed. Jack, ordered on in opposite direction, pointed about 30yds. from his first point; his handler, thinking it was the trail of the bevy just flushed, took him by the collar and pulled him away. Jack took a cast to one side and came right back to same place and resumed his point. Blankenbaker then went back and flushed a covey of birds. This little act of Jack's won him many friends. Down 30 minutes.

Prince, black, white and tan dog, owned by N. T. Harris and handled by Blankenbaker, and Awline Rex II. were next. Rex soon demonstrated he was not an ordinary dog. Prince might have shown up better if he had not been in such hot company. After drawing two big fields blank the judges ordered the handlers to work south. Mayfield replied that Rex was working on birds and if given a few seconds' time would locate them, which he did 100yds. in the woods in fine style. A few more points by Rex and the brace was ordered up. Down 30 minutes.

Cincinnatus Pride, black, white and tan setter, owned by Edw. A. Burdette and handled by Frank Richards, and Forzanda were now put in a field to show their pace and range. Pride is a beautiful dog, is a great bench winner, is of good size, evenly marked, and in the pink of condition. His owner evidently believes that a dog can be a field trial dog and a bench winner too, as he has entered Pride in other trials. With more work Pride will very likely push to the front. He made a point on covey and was steady. Forzanda made two points on singles. Down 38 minutes.

Columbia and Lady Peg after running thirty-two minutes were ordered up, neither having shown merit enough to win. Toney's Gale and Anne of Abbotsford went their usual rapid gait. Toney, after repeatedly false pointing and disobedience, was ordered out of the race, and Anne given a trial on some scattered birds, where she dispelled all chances of winning. With more handling she will be a good dog.

Wednesday morning Cracker Jack and Rex II. came together. In very heavy cover Jack acted a little unruly, finding a bevy and not standing as stanchly as was his wont. Drawing a large field blank, Rex jumped the fence and pointed a bevy stanchly, then moved and pointed again. The birds were evidently running. Jack pointed the same bevy from the opposite side. Down 20 minutes.

Pride and Daisy Rip Rap were the last brace called. In orchard Daisy was found pointing, with Pride backing.

Heavy growth of grass and weeds hindered dogs from doing good work on scattered birds.

Across the fence Daisy pointed a rabbit, backed by Pride. Circling in woods, Frank Richards called point as some birds flushed out of briers. The dogs were now worked toward the road, and not finding any more birds were ordered up and the trials declared ended.

The secretary was handed the decision of the judges and posted the same on blackboard at hotel.

In conclusion, I will say that the hotel accommodations were very good, plenty of horses, reasonable charges, and a clever lot of people.

First, Awline Rex II. (setter); second, Cracker Jack (pointer); third, Forzanda (setter); fourth, Daisy Rip Rap (pointer). X.

Union Field Trials Club.

INDIANAPOLIS, Ind., Nov. 2.—*Editor Forest and Stream:* A meeting of the members of the Union Field Trials Club was held at Carlisle, Ind., Tuesday evening, Oct. 27, with the President, Mr. Norvin T. Harris, in the chair, and the following named officers and members present: Vice-Presidents Royal Robinson, J. L. Adams and Richard Merrill, and S. H Sowell, Joseph T. Akin, G. T. Kerr, Charles Fox and P. T. Madison, Secretary.

The inaugural trials proving so successful, the club decided to hold trials again next year at Carlisle, beginning Monday, Nov. 8, at which two stakes will be run: First, a Derby for all pointers and setters born on or after Jan. 1, 1896; second, an All-Age stake open to all pointers and setters that have never won a first prize in an all-age stake in any recognized field trials in America.

The forfeits in each stake will be $5, with $10 to start. After deducting the actual expenses the balance will be divided 40 per cent. to first, 30 per cent. to second, 20 per cent. to third, 10 per cent. to fourth.

The entries to the Derby will close Sept. 1, and to the All-Age stake Oct. 1. In former years objections to trials in Indiana have been raised on account of the small fields and the early date selected for holding the trials; the date now chosen (Nov. 8) and the location (Carlisle) overcome these objections, as the date will enable handlers to get their puppies ready; and the grounds are not surpassed by any in America, as the fields are large enough to test the range of any dog that ever started in a field trial.

The Union Field Trials Club is entirely social in its character, there being no membership fee or annual dues. Gentlemen desiring to become members can do so by having a club member present their names to the secretary.

All the officers, members and judges serve without compensation, and it remains with the dog owners and handlers to make the prizes as large as they wish.

The following named new members were admitted at this meeting: George D. Maxfield, of Indianapolis, recommended by Mr. G. T. Kerr; N. T. De Pauw, C. W. De Pauw, New Albany, Ind., Peter Lee Atherton, S. P. Jones and W. C. Churchill, Louisville, Ky., recommended by Mr. Norvin T. Harris; Allen Huston, Louisville, Ky., recommended by Mr. J. L. Adams.

P. T. MADISON, Sec'y-Treas.

In our advertising columns the Metropolitan Kennel Club announces its first bench show, under the skillful management of Mr. James Mortimer. The premium list is now ready for distribution.

Central Beagle Club.

SHARPSBURG, Pa., Oct. 2.—*Editor Forest and Stream:* The following entries were placed in nomination for the first annual field trial of the Central Beagle Club, to be held at Waynesburg, Pa., commencing Nov. 10:

Derby—Class A.

For dogs and bitches 15 and over 13in., whelped on or after Jan. 1, 1895:

Theodore Bolljes's b., w. and t. bitch Lady (Driver—Topsy).

D. F. Summers's b., w. and t. bitch Miney S. (Clover—Lucy S.).

D. F. Summers's b., w. and t. bitch Bella S. (Clover—Lucy S.).

D. F. Summers's b., w. and t. bitch Summers's Fly (Clover—Lucy S.).

Derby—Class B.

For dogs and bitches 13in. and under, whelped on or after Jan. 1, 1895:

A. C. Peterson's b., w. and t. dog McKinley (champion Frank Forest—champion Snow).

Dr. S. W. Hartt's b., w. and t. bitch Madge (Streamer—Blossom).

Open—Class C.

For dogs and bitches, all ages, 15 and over 13in., that have not been placed first in any all-age class in field trials:

James McAleer's t., b. and w. bitch Pannic (Doc—Peg).

James McAleer's b., w. and t. bitch Kitty S. (champion Roudy—Music).

D. F. Summers's b., w. and t. bitch Lucy S. (Frank—Jip).

Dr. S. W. Hartt's b., w. and t. bitch Birdie S. (Spotty T.—Judy W.).

Frank Gollie's b., w. and t. dog Doc Weller (Dick Weller—Belva Loackwood).

A. C. Peterson's t. and b. dog Sailer (Royal Forest—Beauty C.).

Dr. George Gladden's b., w. and t. dog Ramroad (Black Joe—Flora).

Open—Class D.

For dogs and bitches of all ages, 13in. and under, that have not been placed first in any all-age class in field trials:

J. W. Simpson's b., w. and t. bitch Judy S. (Jack—Zoe Reed).

Dr. S. W. Hartt's b., w. and t. bitch Blossom (Spotty T. —Judy W.).

L. O. Seidel's b., w. and t. bitch Mollie Dean (Sam—Baby Dean).

Open—Class G.

For Bassets and dachshunde, dogs and bitches, all ages, 15in. and under, that have not been placed first in any field trials:

L. O Seidel's liv. and t. dog Jay S. (Jay—Princess).

C. Klocke's red dog Bismarck K. (Jay S.—Lovely K.).

C. Stearn's tan bitch Flora S. (Jay S.—Flora K.).

Continental F. T. C.'s All-Age Stake.

THE entries to the All-Age Stake number twenty-three, of which nine are pointers:

ROD'S CHAFF—Del Monte Kennels' b., w. and t. setter dog (Roderigo—Gladstone's Girl).

GLEAM'S RUTH—Manchester Kennel Co.'s b., w. and t. setter bitch (Count Gladstone—Gleam's Maud).

NOBLE LEO—A. L. Shonfield's b., w. and t. setter dog (King Leo—Minnie T.).

TONY'S GALE—R. V. Fox's b., w. and t. setter dog (Antonio—Nellie G.).

FORZANDO—R. V. Fox's b., w. and t. setter dog (Gath's Mark—Countess Rush).

ANTON GLADSTONE—J. D. Poston & Co.'s b., w. and t. setter dog (Antonio—Florence Gladstone).

NABOB—Charlottesville F. T. Kennels' b. and w. pointer dog (Rip Rap—Dolly D.).

INDIA—Charlottesville F. T. Kennels' l. and w. pointer bitch (Rip Rap—Dolly D.).

FAIRY KENT—Paul H. Gotzian's l. and w. pointer bitch (Lad of Beaufort—Daisy V. Kent).

MARIE'S SPORT—H. B. Ledbetter's b., w. and t. setter dog (Gleam's Sport—Marie Avent).

HARROLD SKIMPOLE—W. H. Beazell's b., w. and t. setter dog (Whyte B.—Nettie Bevan).

HARWICK—H. R. Edwards's b., w. and t. setter dog (Topsy's Rod—Opal).

HARVARD—H. R. Edwards's c. and w. setter dog (Dan Burges— ———).

VIRGINIA—H. K. Devereux's liv. and w. pointer bitch (Little Ned—Pearl's Dot).

DAME DURDEN—H. S. Bevan's b., w. and t. setter bitch (Eugene T.—Dell Rivers).

SISTER SUE—N. B. Nesbitt's (Agt.) liv. and w. pointer bitch (Jingo—Rooney).

ARAPAHOE—P. Lorillard, Jr.'s, b., w. and t. setter dog (Eugene T.—Maiden Mine).

VON GULL—D. E. Rose's (Agt.) liv. and w. pointer dog (Kent Elgin— ———).

DOMINO—D. E. Rose's (Agt.) b., w. and t. setter dog (Antonio— ———).

FIREFLY—J. S. Crane's liv. and w. pointer bitch (Rip Rap—Clipaway II.).

GEO. CROXTETH—W. D. Henry's liv. and w. pointer dog (——— — ———).

CRACKER JACK—J. L. Adams's l. pointer dog (Lad of Rush— ———).

ÆOLIA'S REX II.—C. P. Mingst's b. and w. setter dog (Antonio—Columbia). P. T. MADISON, Sec'y-Treas.

Western Massachusetts Fox Club.

THE ninth annual hunt will be held at Westfield, Wednesday and Thursday, Nov. 11 and 12. The hunters' horn will sound at 5 o'clock on Wednesday morning for breakfast. At 6 o'clock carriages will be ready at the Park Square Hotel to carry the hunters to the grounds.

The annual club dinner will be served to members and guests at Beethoven Hall, Parks' Block, at 6:30 o'clock on the evening of the first day's hunt.

C. M. GOODNOW, Sec'y.

WESTFIELD, Mass.

Dogs in the City.

COMMISSIONER WARING, of the Street Cleaning Department, New York, took the initiative about a year ago against dogs running at large, with the result that recently the Board of Health passed a resolution which may be the beginning of a legal restriction compelling owners to keep their dogs on their own premises:

"*Whereas*, Complaints have been received from physicians and citizens in respect to the defilement of the sidewalks and streets of the built-up portions of this city by dogs, and dogs led and running at large, as well as the danger to life and health from the bite of dogs, and urging this board to take such action as may be necessary to abate the alleged nuisance; therefore

"*Resolved*, That the sanitary committee be requested to give due consideration to this subject, and to report whether in its opinion the uncleanliness of the sidewalks and streets is of sufficient importance to require the action of this board and the adoption of an ordinance requiring that dogs be kept upon and within the premises of their owners, and not be allowed to run at large upon the public streets and sidewalks, or to be led in any public street, without a permit from this department."

Mange Cure.

LITTLE ROCK, Ark., Oct. 27.—I heard recently of a cure for mange in dogs that I thought might be of benefit to brother sportsmen and worth trying. Two of my sporting friends here have tried it and they claim it a sure shot. They take the hot blood of any animal, obtaining it at the slaughter houses, and rub it into the dog's hair thoroughly, and let it dry on him for an hour, when they give him a bath, repeating the application twice or three times three or four days apart, and in less than three weeks the dog has a beautiful new coat of hair.

Clement Schaer has a dog that was given him by our mutual friend Jacques, of Buffalo, that he sometimes leaves at home when going to his business, and he will telephone his wife to put the dog upon a table where the trumpet will reach the dog's ear. Calling to him, the dog instantly recognizes his voice and jumps from the table and whines to be let out. Mrs. S. opening the door out goes Jack and makes a bee line for the office, ten blocks away, as fast as his legs will carry him, much to Schaer's satisfaction on showing this dog's trick to friends.

J. T. IRWIN.

POINTS AND FLUSHES.

Mr. James L. Little, Sec'y of the Bench Show Committee of the New England Kennel Club, informs us that the club claims the dates Feb. 2 to 5, 1897, for its bench show, which will be held in Mechanics Hall, Boston, and that Spratts Patent will feed and Mr. Oldham superintend it.

The *British Fancier* closed its journalistic career about the middle of last month. Though a bright and readable journal, of value to fanciers, it failed to win the support so essential to existence.

Our correspondent X. corrects an error as follows: "In my report of the heat between Rod's Gladstone and Ripple, Union Field Trials Club's Derby, your types make me say 'ten fields were drawn blank'—it should be two fields."

At the adjourned meeting of the Advisory Committee, held in the A. K. C. office on Oct. 2, the Metropolitan Kennel Club and the Butterfly Bench Show Association were admitted to membership. The Code of Procedure of the Pacific Advisory Board was adopted, which is a set of rules governing the actions of that body as a subsidiary body of the A. K. C.

The *Collie Club Chronicle* mentions the addition of three more members to the Collie Club, namely, Dr. A. F. Webster, Messrs. J. E. De Puyster and C. M. Thompson. The Lottery and Futurity Stakes will be left open till the next issue of the *Chronicle*.

In our advertising columns H. B. Vondersmith, Lancaster, Pa., offers setters. The Fashion Kennels, Hawarden, Ia., offer bull terrier pups. H. L. Kreuder, Nanuet, N. Y., offers beagles. P. O. Box 1314, Philadelphia, wants setter dog. Trainer, care FOREST AND STREAM, wants position. George L. Barnes, Otis, Mass., offers beagles. J. G. Morris, Easton, Md., offers Chesapeakes. Pacific Coast Kennels, Smithville Flats, N. Y., offer setters, pointers and foxhounds. Donald Cameron, Hillsboro, N. C., offers to train and board dogs. J. S. Paul, Waterville, Me., wants pointer puppy. Charles R. Coombs, Belfast, Me., wants Irish setter puppy. Muckross Kennels, Springfield, Vt., offer trained beagle bitch.

Wheeling.

Communications for this department are requested. Anything on the bicycle in its relation to t he sportsman is particularly desirable.

Which Wheel Goes Furthest?

A SUBJECT which is sure to provoke discussion among wheelmen, and to find ready advocates for both sides of the argument, is that of which wheel of a bicycle makes the greatest number of revolutions in going a certain distance, or, in other words, which wheel goes furthest?

Many riders argue that the rear wheel covers the most ground, because the propelling force is applied directly to that wheel, and slipping or lost motion allow it more revolutions than are taken by the front wheel. These men adduce as proof of the correctness of their deductions the fact that carefully registered cyclometers placed on both wheels show a margin in favor of the rear wheel.

But they overlook the fact that this result is due to an entirely different cause, which is that the rear wheel for all practical purposes is smaller than the front wheel, owing to the fact that most of the weight of the rider is carried on it, and the tires therefore flattened out and their periphery reduced.

When riding, the front wheel turns in larger circles than the rear wheel, and consequently must cover more ground.

BEFORE TAKING A RIDE.

When a new rider gets a new wheel he is often at a loss to know just how to keep it in the best condition. At the first introduction there is something alarming about a new bicycle. It is such a perfect piece of mechanism, so finely finished and delicately adjusted, and with such a "touch-me-at-your-peril" look about it, that it seems almost to belong to another world, free from the finite imperfections of this. However, the new soon wears off, and with each scratch or rust spot or dent which appears the rider gets on more familiar terms with his wheel, and soon he begins taking liberties that he would not at first have dreamed of.

He experiments with the adjustment of the wheels, takes the bicyle to pieces to examine the bearings, and tries all kinds of cleaning and lubricating compounds on the chain.

To paraphrase the Greek philosopher's favorite axiom, it is well to "know your wheel," and the man who has acquired a practical knowledge of the mechanism of his mount is sure to derive a greater amount of pleasure from his cycling experience than the other fellow who, through incapacity or laziness, or because he does not have to, knows nothing about his bicycle.

A beginner when starting out for a ride should attend to three things. He should see, first, that every nut is tight, as on a new wheel especially nuts sometimes work loose without much apparent provocation, and a loose nut may mean a bad fall or a crippled wheel. The screw that clamps the handle bars in position is perhaps the most important one to see to, for any looseness here is sure to result disastrously. Then it is just as well to see that all is right about the saddle clamps and cranks. But next to the handle bars the wheels deserve the most attention, for not only is there danger from loose nuts here, but the life and easy-moving qualities of the bicycle itself depend in great measure upon the attention paid them. When once the rider has assured himself that the nuts are tight, he has guarded against accident so far as is possible beforehand. Next he should ascertain whether the running gear works freely. A good way to do this is to lift the bicycle clear of the ground, watching the wheels meanwhile. If everything is right, they will both roll backward and forward several times till the center of gravity is equalized. The front wheel naturally revolves more easily than the rear, which has the additional friction of the chain to overcome; but if either wheel is sluggish and halts before the backward swing has begun, something is wrong. It may be that the bearings need oiling, and incidentally it may be as well to remark that one cannot oil his wheel too much, while it is comparatively easy to err on the other side of oiling too little. Too much oiling causes an overflow which collects dust, but this is easily wiped off, and aside from appearances is of no consequence whatever. It is said that once a week is often enough to oil a bicycle that is ridden short distances daily, and a few drops of oil carefully applied in the oil hole, and not around the outside, are sufficient in any case.

After the wheels are oiled, if they still refuse to revolve easily, the trouble may be due to a faulty adjustment. In the case of the front wheel, which is not hampered by the drag of the chain, it is sure to be due to this cause. The nuts should be loosened and the cones eased up till the wheels run freely; but care should be taken that the bearings are not too loose, in which case the wheel will have more or less play and the wearing surfaces of the bearings will suffer. The test for play, however, should be made after the nuts are tightened, as with the bearings properly adjusted there will always be play before this is done.

If the rear wheel shows no life now the trouble is with the chain, and this should be taken off and cleaned and each joint oiled, and the inner surface lubricated with some good preparation, such as graphite, till it loses its kinks and stiffness and runs over the sprockets as if it was a pleasure.

The novice now is sure of two things, for he knows that the parts of his bicycle are securely held together, and that the running gear is in proper working trim. Before setting off, however, it is just as well to put a little more air in the tires, provided they need it. Even new tires will not hold air under pressure for any great length of time, for no one has yet succeeded in making an infallible valve that cuts off the escape completely.

Regarding the proper amount of air to put into the tire there is a wide diversity of opinion. The manufacturers and professional repair men generally pump the tires about as hard as if they were solid rubber, and the benefit of the air cushion is altogether lost. At the other extreme are the riders who keep their tires so flabby that any sudden jar throws the shock on the rims. The happy medium lies somewhere between. As a general rule it will be found that soft tires make more comfortable riding, while hard tires will last longer and are faster.

Soft tires are not more liable to puncture, but wear on the inner edge next the rim.

The rider who has gone over his wheel something after the manner indicated knows that everything is in good working order, and he is sure to derive more pleasure from his ride than if this assurance was lacking.

Almost as Dangerous as a Porcupine.

First Cyclist—I always get nervous when I see a woman crossing the street ahead of me.

Second Cyclist—So do I. They have so many pins in their clothes that if a fellow collides with them he is almost sure to puncture a tire.—*Pearson's Weekly.*

REPORT YOUR LUCK
With Rod or Gun
To FOREST AND STREAM,
New York City.

The Forest and Stream is put to press each week on Tuesday Correspondence intended for publication should reach us at the latest by Monday, and as much earlier as practicable.

As Others See Us.

The New York *Sun* makes the following extracts from a review of cycling and the cycle trade which appeared in the London *Times:*

"In many respects this is one of the most surprising developments that has ever taken place in the manufacturing industry of the United States within the same length of time. When it is remembered that less than eleven years ago there were only six firms engaged in the business, with an output of a few thousand bicycles, where there are now more than 500 leading firms, with a product of 1,000,000, and innumerable smaller ones, which will probably add 200,000 more, comment seems hardly necessary. As nearly as can be known, more than 3,000,000 bicycles are already in use in the United States, and some authorities make the number greater than this by nearly 1,000,000. Even the smaller estimate shows that nearly one person out of twenty-four of the 70,000,000 people have already taken to the cycle as a matter of business, amusement or health. In France, where the number is known because of the collection of a tax, the proportion is thus far only one in each 250 of the population. As the mountainous districts of the United States are not generally thickly populated, and the country as a whole is more level than in Europe, it is not difficult to understand the rapid development of the cycle as a means of travel; on the other hand, the fact that in many parts the roads are ill adapted to the use of cyclists during a considerable part of the year would seem to have a discouraging effect on this development. * * * In spite of the large domestic demand, such an unlooked-for growth as this is certain to have an effect upon the bicycle industry in other countries. The high price of labor, which some think a drawback, is really an advantage, because high-priced labor is so efficient, and its ingenuity in the devising and manipulating of machinery is so highly developed that the labor cost of the completed article is less than it is with lower-priced labor working under less favorable circumstances. * * * It would be idle to make predictions about the future of what is really a new industry, but in any event it is plain that whatever the result may be, the United States must be reckoned with as an element in it. Unless there is some check in the demand, it seems likely from the activity shown by transatlantic manufacturers that from 40,000 to 50,000 cycles of high quality and of American make throughout will be offered in the English market before the close of the season of 1897. * * * The one question of interest in a way to the user of the cycle, but of absorbing interest to the investor is, 'How long will it last?'"

A Sportsman's Bicycle.

New York, Oct. 28.—*Editor Forest and Stream:* Why don't some first-class firm get up a sportsman's wheel? I will try to explain what I mean by that. There are a few friends of mine who are old at gunning, but new to the wheel, or quite so, who claim that the large tire, say 2in., is best for country roads. I am too new a rider to give an opinion, but should think that their argument holds good. They also claim that a gear case is absolutely necessary for rough country riding, as, for instance, on Long Island, where the roads are mostly sandy.

I have a cheap wheel with 1⅝in. tires, and find it not quite to my taste when I run off the path into the ruts along the roads. Next spring I want to get the best wheel in the market for just such riding.

George E. Jantzer.

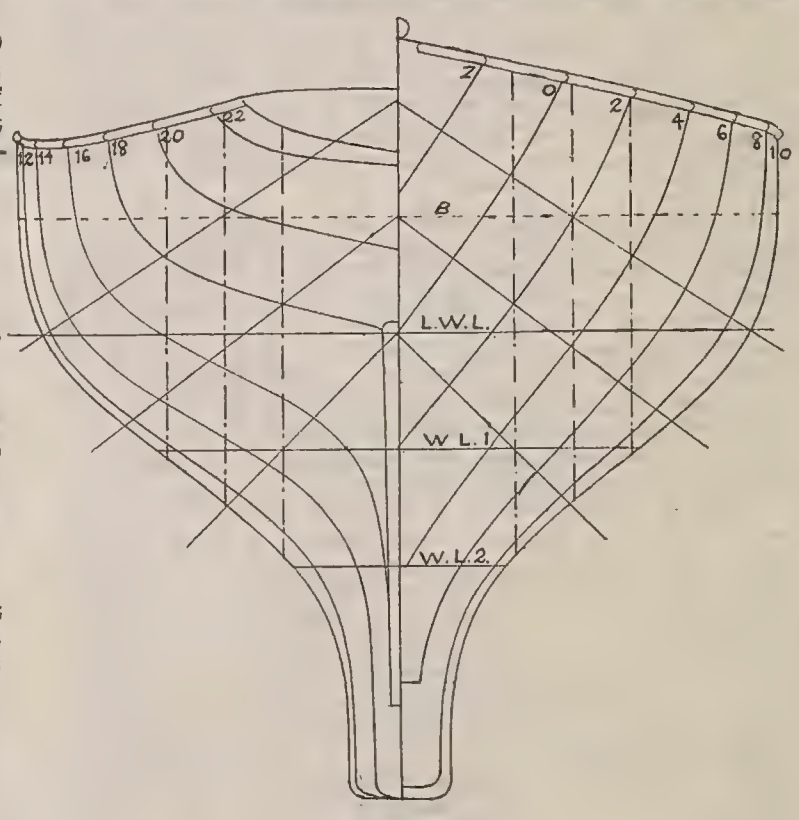
Yachting.

The new rule of the road originated by the Larchmont Y. C. last spring, and just adopted by the New York Y. C., is a most peculiar one, heretofore unknown in yachting. One direct result is to give official recognition to a practice that has heretofore been recognized as both unsportsmanlike and dangerous, that euphoniously known as "hogging the line." According to the new rule, in the case of a start down wind any yacht which may be so fortunate as to get a berth at one end of the line has the right to run the length of the line, no matter what risk or delay she may cause to the fleet at large. While nominally devised to prevent fouls and disputes in maneuvering, it is a direct means of producing them. While it is most difficult to frame a rule that will cover all the possibilities and contingencies involved in the start of a race, it seems to us that the new rule is entirely in the wrong direction, and that a far safer and more reasonable solution of the difficulty would be that advanced by us in connection with the Vigilant-Defender protests last year. This was nothing more than that some official declaration should be made to the effect that the rule now in force to govern the passing and rounding of marks applies as well to the marks at the starting line as it now does by inference. By this construction a yacht which is on her proper course to cross the line has the right of way over another yacht that is further from the mark than she is, whether the latter be close hauled or free.

Unless this new rule be passed by the great majority of American yacht clubs, and we see no reason why it should be save to preserve uniformity with the two clubs that have adopted it, a most undesirable degree of confusion must exist, a yacht sailing under one rule one day and another the next; a state of affairs which yachtsmen have labored for some years to escape from.

Even if the rule were good beyond question, it was a mistake for one club to adopt it; a rule of this kind should be adopted by at least a majority of the clubs, else matters should be left as they are. There was no pressing necessity for the passage of the rule last spring by one club without consultation with others, and the presence of two rules of a contrary nature in the same locality is plainly wrong. The whole tendency of the clubs about New York for some years, in the absence of an association or any specific agreement, has been toward uniformity and harmony in the rules, to the benefit of yacht racing. Any attempts of individual clubs at independent legislation are steps in the wrong direction.

A FIRST ATTEMPT AT YACHT BUILDING.



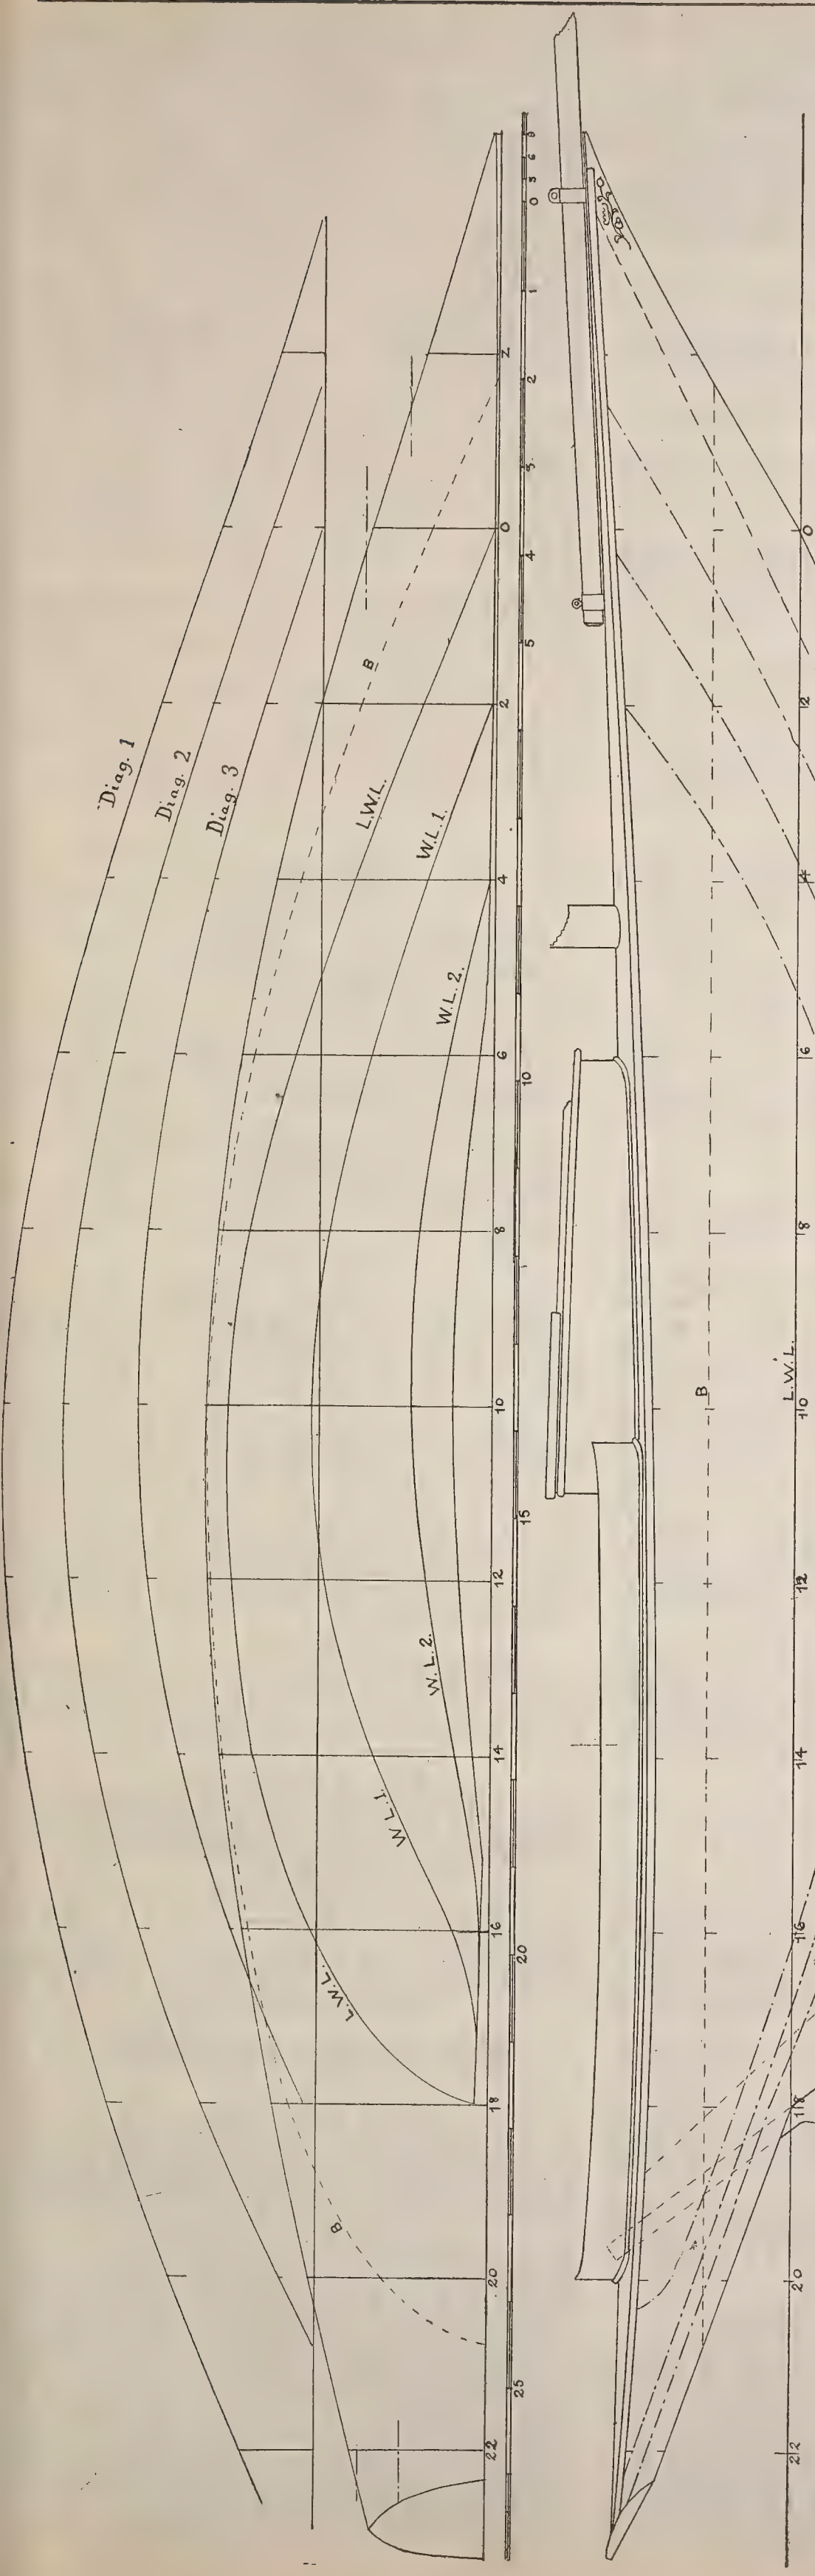
By E. P. Morris.

It has been for some years my special ambition, outside of the serious purposes of life, to own a boat of my own design, and, so far as it was possible, of my own construction. This summer the ambition has been realized, and I have thought that an account of the process and the result might be interesting to the readers of the Forest and Stream who may be touched by a like ambition.

For the work of designing my only equipment came from Kunhardt's "Small Yachts" and from the columns of the Forest and Stream, though before the boat was finished I read Dixon Kemp's "Manual of Yacht and Boat Sailing," and used some formulas from his larger "Yacht Architecture." I knew at first very little about mechanical drawing, but had perhaps a better acquaintance with mathematics than most men retain after leaving school or college.

I followed the course with which many readers of the Forest and Stream are doubtless familiar, copying published designs on a different scale and making the calculations to see whether I could get results agreeing with those given in the books. I tried model making also, taking off the models and working backward and forward—that is, using the drawing to correct the model and the model to correct the drawing. For body plans I found it worth my while to make a complete set of curves, miniature frame patterns, which were cut out of ⅛in. pine and worked down the edge with sandpaper into true curves. This method, which would be too slow for an expert designer, has two advantages: it enables one to get the exact curve by successive approximations, which can be tested by drawing on a separate bit of paper until all the curves are harmonious, and it also makes it possible to ink the body plan more neatly than I at least could do with battens. In these ways I worked out several designs, one of which I submitted to the yachting editor of the Forest and Stream, with many questions as to the probable behavior of the boat. This was the only help I had, except from books.

When I came to the design from which I hoped to build, I redrew it half a dozen times, making slight changes each time and going through all the calculations, even to the amount and location of the ballast. I also used different scales, ½in., 1in. and 3in. The last was a waste of labor, for I could not get far enough away from my drawing to tell whether the curves were fair or not. The plans as they were made were pinned up on my walls, and this test frequently showed errors which had passed unnoticed before. For this plan also I made a complete set of moulds on a 1in. scale, and I went over the calculations two or three times, using Dixon Kemp's tables, the formulas in "Small Yachts" and a rough method of my own devising.



LAPWING—BODY PLAN.

Finally a table of offsets was made and the body plan was enlarged to the full size. I had no convenient means of drawing a full-sized sheer or waterline (half-breadth) plan, and this enlarged plan was used for bending and setting up the frames without having been faired up. But it is easy to draw within $\frac{1}{60}$in. and even closer, and this when enlarged would be correct to ¼in. There was some risk in it, but in fact the work proved to be entirely satisfactory.

On the large drawing the planking was taken off and the bevels were drawn. For the latter I used a simple method, suggested by an acquaintance, which I have not seen described in the books. The frames were sided 1⅛in., which is about one-seventh of the distance from frame to frame. For so short a distance as 1ft. the curves of waterlines and diagonals are practically straight lines. If then the distance, for example, between No. 6 and No. 5, measured along a diagonal in the body plan, is 3in., the distance from one edge of No. 6 to the other on the same diagonal would be $\frac{3}{7}$in. By establishing a number of such points I fixed the curve of the beveled edge and, to avoid confusion, marked it in red ink. This saved all bother with angles and was very accurate.

The dimensions were chosen after much comparison of designs and boats. The measurements are as follows:

Length over all	27ft.	9in.
l.w.l	18ft.	
Overhang, forward	4ft.	6in.
aft	5ft.	3in.
Beam, on deck	6ft.	7in.
l.w.l	6ft.	1in.
Draft	4ft.	
Least freeboard	1ft.	8½in.
Sheer, forward		10in.
aft		4in.
C. B., from bow	9ft.	9in.
C. L. R., from bow (without rudder)	9ft.	9in.
C. E., from bow	9ft.	5in.
Displacement	6,425lbs.	
Ballast, iron on keel	2,440lbs.	
inside, about	500lbs.	
Sail area	404sq. ft.	

LAPWING. DESIGNED AND BUILT BY E. P. MORRIS, 1895-6.

I attempted to calculate also the center of gravity of the hull and spars, but the task was too much for me, and I had to content myself with locating the iron ballast in such a way that its center of gravity would be directly under the C. B.; this gave exactly the right fore-and-aft trim when she was launched.

About the various problems of construction and size of timbers I felt so much in doubt that I again applied to Mr. Stephens for advice; without his full and careful directions I am sure that I should have fallen into error. As to rig and deck plan there is nothing unusual about the boat. Two jibs were chosen rather than the single jib, not because of fashion, English or American, but because it saves reefing; a rig that is largely used by fishermen is sure to have practical advantages. The floor of the watertight cockpit is 14in. below the deck and the space under this floor is ample for a wide berth. The two other bunks are 20in wide and 7ft. long. The seats are made by setting the coaming back on deck about 15in. from the cockpit. The headroom is about 4ft. 5in. and there is a large space for storage.

The boat was built at Pemaquid Point, Maine, during the summers of 1895 and 1896. The distance of this place from Boston, Portland and Bath, whence the materials were to be ordered, made it necessary to provide more than enough of everything and somewhat increased the expense and trouble. I had, for example, nearly enough planking left to cover another boat, and nails enough to build a schooner. Of oak, on the other hand, I had no piece left large enough for a tiller and scarcely for an extra cleat. I had a shed put up beforehand—which paid for itself ten times over in convenience and saving of time—and I built a long bench against one side. It had been my hope that I could do all the work myself, but the first lesson I learned was that the building of even an 18ft. boat is a long operation. It took me, I think, a week to shape the keel and cut the rabbet, and a whole day to fit the sternpost to the keel. This was partly because of my inexperience, but the heavier work would be slow even for a good workman. I remember one day when everything worked beautifully and I put up three pairs of frames and fastened them to the keel and floors.

I have always worked at cabinet making as a recreation and I enjoy hard manual labor as a change from my ordinary occupation, which is sedentary and bookish, but with my best efforts I seemed to advance very slowly. I wonder how many of my readers have ever bored a $1\frac{1}{8}$in. hole through 20in. of tough oak or a $\frac{1}{2}$in. hole through 38in. My equipment of tools was sufficient in most respects, but the bits and augers were poor and my muscles not yet hardened, and I think I spent half a day on some of the longer holes.

A fortnight's experience and a little calculation showed me that I must have help if the boat was to be finished within two summers, and eventually I had two men working with me. One was a very skillful carpenter, but with no knowledge of boat building; the other, though he was not a trained boat builder, had built some small boats and was a man of great natural ingennity. During the first summer I was at work about six weeks, one man about four and the other two; with this work we set up the frame and planked her. The spars and rudder were made during the winter of 1895–6, and the caulking done early in the spring. With this start we began work July 20 and launched her Aug. 19. I suppose this would seem very slow work to a professional builder; to me it seemed very hard work.

As to the other side of building, the art of setting up a frame and fitting planking, I found that much easier than I had anticipated. There is no real difficulty in getting the frames right by the help of a line from sternpost to stem piece and the use of a spirit level, if one has an accurate full-sized drawing. The taking of a spiling can be learned from Stephens's book, "Canoe and Boat Building for Amateurs," and is really simple if one is patient and determined to be accurate. The planking, except the oak garboards, bent without difficulty.

It is true that one of my helpers had some experience, which was of great value to us, and it is true also that we had to do a good deal of thinking and planning, but that is a part of the pleasure, and I think I may fairly say, as the second lesson of my experience, that the art and mystery of boat building is a very easy art and a very small mystery. If I had the thing to do over again I should get some instruction from the nearest boat builder, paying him for the privilege of asking questions. I should watch carefully the plumbing of the keel, the setting up of frames, and the marking out and cutting of planking, but I should pay even more attention to the boring for rivets and bolts and the driving and heading up. Especially I should want to understand thoroughly the use of mechanical appliances like wedges and clamps for bending the pieces and holding them in place for fastening. Then I should practice with some odd pieces of stuff until I could clinch a nail and head a rivet

Perhaps I am too sanguine and underestimate the difficulties, but I am sure that the three of us together knew less when we began than one trained workman, yet we did not split a plank or spoil a timber, or find ourselves obliged to undo or patch up a single piece of work except a place in the deck where three or four strips had to be taken up in order to plane out a lump, and I think the boat has a very neat and well-finished look.

I ought not to forget our difficulties with varnish and glue. The "Directions for Use" sent with such things are always inadequate—sometimes absurdly so—and our varnish ran very badly in the first rain. I do not know the reason, but I suppose we put it on wrongly. As to the glue, which we used for the deck seams, the directions told us many interesting things which we did not want to know, but we were obliged to invent a number of ingenious ways of pouring it—none of which worked—before we found out that it made no difference how much we spilled over the seams, because the warm glue could be cut off with a chisel and melted again.

To an observer with an eye for boats it is pleasant to notice how frequently local types have survived or have been worked out in different places. The Block Island double-ender, the Connecticut River boat, the New Haven sharpie, are proof that we are not yet reduced to a dead level of monotony. The Pemaquid type is an able boat of about three beams to the over-all length, usually a centerboard, and about as long on the keel as on deck.

To men who knew no other type, and who were accustomed to judge a boat by length and beam on deck, and by length of keel, my boat was a strange experiment; all the stranger and more doubtful because she was planned by a man whose business is rather distantly removed from boat-building. She was inspected with many shakes of the head—even with much wagging of the head—by most of the men on the Point. They evidently wished me well, and they were too polite to discourage me by expressing an unfavor-

able opinion; but I caught a little of the talk and wished I could hear more.

"No bilge to her," "too short on the keel," "never 'll carry her sail," "she'll go straight to the bottom with all that iron on her," were some of the comments. The location of the iron at the forward end of the keel was a matter of frequent criticism, and it was generally prophesied that she would be "all down by the head." One old sea captain, who I am sure wished me all success, said, after seeing her launched, that he "wouldn't go to Portland in her for all the gold she would carry, for she wouldn't stand up under her sails, let alone any breeze."

One of my helpers, to whom I had loaned some copies of the FOREST AND STREAM, and who has a great deal of intelligence, "stuck to it," as his brother afterward told me, "that Mr. M. had got hold of something." I fancy he had to endure some friendly joking from his neighbors, and if his faith was firm all the time it was more than I can say for myself.

[TO BE CONCLUDED NEXT WEEK.]

The Y. R. U. Rules.

THE following amendments to the racing rules have been recommended by the Council of the Y. R. A., and will be passed upon at the general meeting next month. The original proposals have been materially modified in some cases in order to avoid a conflict with the new restrictions recently adopted by the Larchmont and New York yacht clubs. On this account the original proposal to measure all yachts with crew on board has been modified, the limit being placed at the 30ft. class, as in the other clubs, as only harm could result from any conflict between different clubs in the form of two methods of measuring the same yachts.

As the small yachts will hereafter be included under the regular rules, a new method of measurement for jib-headed mainsails has been proposed, permitting of the direct application of the Seawanhaka rule to this rig, as well as to the gaff mainsail. The classification is identical with that of the two clubs, being in fact the same as the Union has used for two years.

The abolition of time allowance between new yachts, with other of the proposals, we have already commented on in connection with other clubs.

RULE II.—MEASUREMENT.

Add to Section 2: All yachts in the 30ft. and lower classes shall be measured for l.w.l. length with the same number of persons on board as are allowed for crew in the yacht's class, and whose average weight shall not be less than 150lbs. each, or with a dead weight placed on board equivalent thereto.

Section 3, new par. 7: In yachts having jibheaded mainsail, the upper point of measurement in taking the perpendicular shall be the under side of the sheave in the highest jib halyard or spinaker block, and 80 per cent. of the distance from this point to the under side of the sheave in the highest halyard block on the mast, or, when a yard is used, to the end of the yard when hoisted in place, shall be added to the base line.

SUBSTITUTE FOR RULE III.—CLASSIFICATION.

1. All yachts shall be classified by racing length and shall be divided into classes as follows:

Schooners.—First class, all over 95ft; 95ft. class, B, not over 95ft. and over 85ft.; 85ft. class, C, not over 85ft. and over 75ft; 75ft. class, D, not over 75ft. and over 65ft.; 65ft. class, F, not over 65ft.

Sloops, Cutters and Yawls.—First class, G, all over 70ft.; 70ft. class, H, not over 70ft. and over 60ft.; 50ft. class, J, not over 60ft. and over 51ft.; 51ft. class, K, not over 51ft. and over 43ft.; 43ft. class, L, not over 43ft. and over 36ft.; 36ft. class, M, not over 36ft. and over 30ft.; 30ft. class, N, not over 30ft. and over 25ft; 25ft. class, P, not over 25ft. and over 20ft.; 20ft. class, Q, not over 20ft. and over 15ft.; 15ft. class, R, not over 15ft.

Catboats.—30ft. class, S, not over 30ft. and over 25ft; 25ft. class, T, not over 25ft. and over 20ft.; 20ft. class, V, not over 20ft. and over 15ft; 15ft. class, W, not over 15ft.

2. Open yachts shall not be classed with cabin yachts.

3. Yachts launched prior to Nov. 1, 1896, in the 30ft. and lower classes not exceeding the class length by 5ft. and that have not increased in measurement since that date, shall be eligible to sail in their respective classes.

SUBSTITUTE FOR RULE IV.—TIME ALLOWANCE.

Time allowance shall be calculated on racing length according to the appended table, but yachts launched after Nov. 1, 1896, except in the 1st class of schooners and the 1st class of sloops, cutters and yawls, shall not be entitled to time allowance, and no yacht that has been increased in measurement for the purpose of sailing in a class above that in which she sailed prior to that date shall receive time allowance from other yachts in that class.

RULE V.—ALLOWANCE FOR RIG.

Change 94 per cent. to 93 per cent.

RULE VII.—ENTRIES.

Add to Sec. 1: "Entries must also state whether yacht was launched prior to Nov. 1, 1896."

Strike out Sec. 3.

RULE IX.—SAILS.

Add to Sec. 1, par. 2: "and clubtopsail."

Add to Sec. 1, par. 3: "and in the 1st, 70ft. and 60ft. classes, clubtopsail also."

SUBSTITUTE FOR RULE X.—BOATS AND LIFE BUOYS.

Section 1.—Yachts in the 1st, 95 and 85ft. classes of schooners, and in the 1st class of sloops, cutters and yawls, shall carry on deck a serviceable round-bottomed boat measuring not less than 14ft. in length, with oars and rowlocks or thole pins lashed in; and in the 75 and 65ft. classes of schooners, and in the 70ft. class of sloops, cutters and yawls a boat as above not less than 12ft. in length, and in the 60ft. class a boat as above not less than 10ft. in length.

RULE XI.—FITTINGS, WATER AND BALLAST.

Add to Section 1: "All yachts, except in the 1st class of schooners and 1st class of sloops, cutters and yawls, shall keep their galley fixtures and fittings on board and in their proper places. All yachts must carry one serviceable anchor and cable on board."

SUBSTITUTE FOR RULE XII.—CREWS.

1. The total number of persons on board a yacht shall not exceed the allowance in the following schedule:

Schooners.—1st class, 1 person to every 2ft. of R. L. or fraction thereof; 95ft. class, 35 persons; 85ft. class, 30 persons; 75ft. class, 25 persons; 65ft class, 20 persons.

Sloops, Cutters and Yawls.—1st class, 3 persons to every 5ft. of R. L. or fraction thereof; 70ft. class, 20 persons; 60ft. class, 15 persons; 51ft. class, 12 persons; 43ft. class, 9 persons; 36ft. class, 7 persons; 30ft. class, 5 persons; 25ft. class, 4 persons; 20ft. class, 3 persons; 15ft. class, 2 persons.

Section 3. In Corinthian races, except in the schooner classes, and in the 1st, 70 and 60ft. classes of sloops, cutters and yawls, each yacht must be steered by the owner or other amateur, and must be manned by amateurs; but any yacht may carry and use her regular professional crew. Yachts in the 30ft. classes and under shall not carry more than one professional.

SUBSTITUTE FOR RULE XVI.—PRIVATE SIGNALS AND NUMBERS.

Each yacht shall carry the owner's private signal at the main peak, and display her racing number above the reef points at an equal distance from the luff and leach on both sides of the mainsail.

RULE XIX.—STARTING AND FINISHING SIGNALS.

Sec. 1.—Add to 4th par.: "A red and white ball for a fourth division, a white and blue ball for a fifth division, and a blue and red ball for a sixth division." Strike out 5th par.

RULE XXII.—SHORTENING OR REVERSING COURSES.

New Sec. 2: Should the regatta committee deem it desirable, on account of the direction of the wind, to order the course sailed in a reverse direction from that specified in the instructions, flag "B" hoisted over the blue peter (the preparatory signal) shall be the signal for so doing.

RULE XXIX.—DISQUALIFICATION.

Sec. 5: Strike out the words "or within ten days thereafter."

NEW RULE.—LIMIT OF DRAFT.

The maximum draft of any yacht when in racing trim shall not exceed that specified for her class in the following table, exclusive of centerboard, except as hereinafter mentioned; but these limits shall not apply to any yacht launched prior to Nov. 1, 1896, when racing in the class in which she was classified prior to that time. This exemption, however, shall not be so construed as to permit the increase of the draft of such a vessel beyond that allowed for her class.

Schooners.—First class, no draft limit; 95ft. class, 14ft draft; 85ft. class, 13ft. draft; 75ft. class, 12ft. draft; 65ft. class, 11ft. draft.

Sloops, Cutters and Yawls.—First class, no draft limit; 70ft. class, 13ft. draft; 60ft. class, 11.5ft. draft; 51ft. class, 10 25ft. draft; 43ft class, 9ft. draft; 36ft. class, 8ft. draft; 30ft. class, 7ft. draft; 25ft. class, 6ft. draft; 20ft. class, 5ft. draft; 15ft. class, 4ft. draft.

Catboats.—30ft. class, 7ft. draft; 25ft. class, 6ft draft; 20ft. class, 5ft. draft; 15ft. class, 4ft. draft.

Should a yacht's draft exceed that given for her class, the amount of excess shall, in computing her measurement for racing length, be multiplied by 2 and added to the length of the l.w.l.; provided, however, that in no case shall this excess be more than 10 per cent. of the draft given for her respective class. On all yachts launched after Nov. 1, 1896, there shall be placed upon the hull, and immediately over the point of greatest draft, a metal plate or other distinct mark. Such mark shall be placed above the l.w.l. and within 6in. of it, and the owner shall furnish to the regatta committee, if required, a certificate of the vessel's draft to such mark, signed by himself, the designer, or the builder of the yacht.

RULE XXX.—PRIZES.

Substitute for Section 1: Prizes shall be awarded in all classes in which one or more yachts sail the course.

DEFINITIONS.

New paragraph: Sloops and Cutters.—A yacht to be considered a sloop or cutter shall have not more than 80 per cent. of the sail area aft of the mast.

The Principles of Yacht Measurement.

Editor Forest and Stream:

The new measurement formula recommended by the Council of the British Y. R. A. furnished a good illustration of the defects in the type of measurement rules in general use to-day. This formula was made by the best yachting experts, the same class of men who have heretofore made several other similar formulæ which have been failures.

It must be assumed that they have a definite object in view; and it may not be a violent assumption to state it substantially as follows:

"Our purpose is (1) to make a rule by which we can fairly measure yachts of different form which race together; (2) to encourage the building of wholesome yachts. The proportions of the ideal yacht of this Association lie within the following limits, viz: beam, from — to — per cent. of l.w.l.; over-all length, from — to — per cent. of l.w.l.; draft, from — to — per cent. of l.w.l.; $\sqrt{\text{sail area}}$, from — to — per cent. of l.w.l.; immersed area of mid-section, from — to — per cent. of circumscribing rectangle, etc.

"Yachts hereafter built for competing in the races of this Association shall be within the foregoing dimensions."

If this be the intent of the rule, why was it not better to say it in language that anyone can understand, with a certainty of receiving precise results, instead of making it impossible to foresee the results by putting the building specifications or restrictions into the body of the following complicated mathematical formula, which it is also proposed to use for figuring out handicaps or time allowances, viz.:

$$L.+1.2\ B.+\text{Girth}+0.5\ \sqrt{S}?$$

This type of formula is by its nature especially designed to encourage the building of freaks and monsters by allowing any dimensions to be enlarged to any extent by cutting down others. It does not effectively control, within reasonable limits, all the main elements of size, but instead thereof regulates the aggregate of these elements.

SEXTANT.

Thus far no yachting body has been willing to indorse such a statement as is set forth by our correspondent, that it believes in the restriction of the elements of design within certain fixed limits, maximum and minimum. This is done in certain special classes, and the New York and Larchmont clubs are now dealing with one element on this principle; but the position of the clubs of this country and Great Britain has always been against this type of rule and in favor of one in which the individual factors are unlimited and only the total is limited.

Which of the two methods is the better may be an open question. In spite of the failure of so many of the latter type, with unlimited factors, we have not yet seen any feasible proposition advanced for a formula of the former type, though a suggestion in this direction was made by the British designers in 1894.

New York Y. C.

A SPECIAL meeting of the New York Y. C. was held on Nov. 5, at which the amendments to the racing rules adopted at the previous meeting were finally ratified. The following new amendments were also approved:

Rule I., Section 4.—On the fifth line after the word "time" add: "This exemption, however, shall not be so construed as to permit a vessel launched prior to Oct. 22, 1896, to increase her draft beyond the limit allowed for her class."

Section 6.—Any yacht that increases her measurement for the purpose of sailing in a class above that in which she would sail, according to the last official measurement taken prior to Nov. 1, 1896, shall not be entitled to any time allowance from other yachts in that class.

Section 6 to be changed to section 7.

Rule IV., Section 3.—On the first line after the word "prize" add the following: "Of full value." Should a yacht be obliged to sail alone in her class and should go over the course of her class, she shall be entitled to a prize of one-half the value of the regular prize, and upon same shall be inscribed "Walkover prize."

Make a new section for the balance of section 4, to be known as section 5, and on the third line of same change the word "minimum" to "mean."

Rule XVI., Section 8.—At the end of the section add: "In order to prove beyond question that an overlap has been established, the owner or representative of the overtaking yacht shall hail the overtaken yacht, stating that he has an overlap and that he shall maintain his rights. The owner or representatives of an overtaking yacht intending to claim an overlap shall notify the overtaken yacht to that effect by hailing her."

Sec. 14.—On the fourth line, after the word "mark," add "except as provided in Sec 15."

Sec. 15.—Make a new section, to be 15 and to read: "When two yachts in maneuvering for the start, both on the same tack, one to the windward and one to the leeward, and the weather yacht, being freer than the leeward yacht, should the leeward yacht be close hauled on the wind, and before an overlap has been established, the leeward yacht shall have the right to hold and maintain her course, even if thereby the windward yacht should be forced on the wrong side of the starting mark."

Change the present Sec. 15 to 16, and Sec. 16 to 17.

Sec. 16.—On the tenth and eleventh lines strike out the words "or bear away."

These latter amendments must be ratified at a later meeting.

Massachusetts Y. R. A.

AT a meeting on Oct. 29 the Massachusetts Y. R. A. adopted the following class limits, to conform to the new measurement:

First Class: Cabin yachts, 24ft. and under 29ft. sailing length (existing open yachts of first class, 1896, may sail in this class).

Special Class: Open yachts, 20ft. and under 24ft. sailing length.

Second Class: Cabin yachts, 20ft. and under 24ft. sailing length.

Third Class: Yachts 17ft. and under 20ft. sailing length.

Knockabout Class: Yachts of the Association complying with the restrictions of the Knockabout Association.

Fourth Class: Yachts under 17ft. sailing length.

The measurement of any yacht launched after Dec. 31, 1896, shall be assumed to be the larger limit of her class, so long as the present measurement and classification are in force. The special class may carry no more than six men.

Other amendments were adopted as follows:

Entries must be made to the secretary of this Association, and must specify name, owner, rig, amount and kind of ballast, crew, sailing length, etc., and the club to which she belongs. Such entry shall answer for all races sailed under the rules of the Association for the season. A new entry must be made each year.

A cabin yacht shall be defined as either an entirely flush-decked yacht with suitable cabin accommodations below deck, or a decked yacht with a permanent fixed cabin house, with sides not less than one-half the yacht's sailing length, and in breadth not less than two-thirds of yacht's beam on deck, and shall have watertight cockpit with its deck above the load waterline.

YACHTING NEWS NOTES.

Full many a large and handsome yacht has lost her owner because he has tired of her, or again because a reduced income forced him to abandon the extravagant luxury; but here is one that, losing her master by his untimely death, has been specially provided for in her declining years. Steadfast unto the end, she was not sold off at half price to get rid of her, but, like a faithful dog or horse that has outlived its days of usefulness, has been allowed to finish out her life in quiet repose. It is only a few years ago that the schooner yacht Dauntless was one of the very stanchest boats afloat. Now, with sails forever furled, with pennants hauled down for the last time and house canvased over, she tugs at an anchor that seems destined never to rise again. Her master was in life Com. Caldwell H. Colt, the only child of the late Col. Samuel Colt, the arms manufacturer. He died at Punta Gorda, Fla., about three years ago, while on a cruise. His fondness for the yacht led his wealthy mother to preserve her, though no longer of use, just as others lay away in a drawer the toys of dead children. So it is that the yacht idles her life away—a silent memorial. In further remembrance of the dead man's yachting career the new Colt memorial house in Hartford costing several hundred thousand dollars, bears on its facade a beautiful reproduction of Dauntless in sculptured stone and many other suggestions of the sea. Anchored off Essex, a few miles up from the mouth of the Connecticut River, the good old yacht is now living out her life of ease. It is said that she will never again go into commission—certainly not so long as the mother lives. The spot is quiet, secluded and all that a retired favorite could ask for in her old age, and the same waters that lap her side flow, forty miles up stream, within a stone's throw of the celebrated factory whose machinery produced the wealth that purchased and maintained the boat.—*Brooklyn Eagle.*

The Daimler Motor Co., of Steinway, Long Island, is making very extensive additions to its plant in consequence of the expansion of its business in two directions. The building shops of the company have been located some distance from the water, but they will be now given up entirely to the manufacture of horseless vehicles and stationary engines, two lines of which the company make specialties. To accommodate the launch department of the business an entirely new plant will be erected at once, the ground having a frontage of 300ft. on Bowery Bay, with a depth of 275ft. The new building shops will be on this property, and will afford facilities for constructing power yachts and launches up to 150ft. In connection with them will be a yard for winter storage of yachts, with ways and transfer tracks operated by the company's motors. There will be a secure basin for small yachts, with a draft of 6ft. at low water, and for the winter mooring of large yachts a bulkhead will be built out 400ft into Bowery Bay, with an L at the end affording every protection, the inclosed space being dredged to a depth of 10ft. at low water. The firm has now orders for two launches of 30ft. length, one of 42ft., two of 35ft., three of 30ft. and two of 33ft. Chas. S. Desmond, formerly with the Racine Boat Mfg. Co., is the superintendent and designer of the Daimler Co.

The two yacht clubs of Toledo, the Ohio Y. C. and Toledo Y. C., have recently consolidated under the name of the Toledo Yachting Association, and the charter of the old Ohio Y. C. The new organization numbers 300 members, with a fleet of fifty yachts. Its formation is likely to do much for yachting on the lakes, Toledo being favorably located for a yachting center.

Gen. Joseph T. Torrence, of Chicago, who died on Oct. 31 after a brief illness, was greatly interested in steam yachting, and had just placed an order with the Racine Boat Mfg. Co., builders of the successful Pathfinder, for a steel steam yacht of 200ft. length, 19ft. beam and 10ft draft, with a speed of 26 miles.

The steam launch Gem, formerly of Flushing Bay, has been purchased by Com. Edw. Spott, and will be enrolled among the fleet of the Rockaway Point Rod and Gun Club's (the Cuckoos) yachting department.

Sec'y-Treas., W. D Stearns, Detroit, Mich.
Executive Committee: R. M. Lamp, Madison, Wis.; C. J. Steadman, Cincinnati, O.; F. W. Dickens, Milwaukee, Wis.

The A. C. A. Executive Committee Meeting.

THE date originally set for the meeting of the executive committe of the American Canoe Association, Nov 13, has been changed to Saturday, Nov. 21, the place being Toronto, Canada. The meeting will be called to order at 10:20 A. M. at the house of the Toronto C. C. While there is little business of importance outside of the ordinary routine of arrangements for the next meet of the Association to come before the meeting, it is very desirable that all of the divisions should be represented, and also that a majority of the Association officers should be present to take part in the discussions. In spite of the long journey, we hope that the different members of the Division committees may make an effort to be present, and that those who cannot will try to find proxies qualified to represent them. All visitors from the States may be sure of a hearty welcome at the hands of the Toronto canoeists.

MR. JOHN R. BLAKE, of Galt, Ontario, has been elected secretary-treasurer of the American Canoe Association, by a mail vote. No candidate for the office was presented at the meet in August, the election being thus deferred.

A. C. A. Membership.

APPLICATIONS for membership may be made to the purser of the division in which the applicant resides on blanks furnished by purser, the applicant becoming a member provided no objection be made within fourteen days after his name has been officially published in the FOREST AND STREAM.

NORTHERN DIVISION.

Name.	*Residence.*	*Club.*
Wm. A. Cumming	Quebec	Cookshire.
Wm. W. Alexander	Ontario	Toronto.
Charles E. Brittion	Ontario	Gananoque.

Associate members: Miss Maud Bigland and Miss Ethel Wilkerson, Cookshire, Quebec; Miss Eleanor Loetitia Phillimore, North Berwick, Scotland.

Rifle Range and Gallery.

Pacific Slope Riflemen.

SAN FRANCISCO, Cal., Oct. 25.—The riflemen who visited the Shell Mound Range to-day had some difficulties to overcome before making good scores. The shifting shadows caused by clouds passing over the face of the sun, together with a varying wind, made the conditions somewhat unfavorable.

COLUMBIA PISTOL AND RIFLE CLUB.

Members of the Columbia Pistol and Rifle Club were out in force, and kept the markers on four targets busy all day. The majority of the matches were re-entry contests, so that owners of both rifles and pistols kept banging away until it was time to go home. The contest for the Glindemann medal for military rifles has received a boom, several members of this club expecting a challenge from another organization, and military rifles being a weak point with the Columbias. J. E Gorman made his first effort with the musket to-day, and ran up two strings of 44 and 45, military count. F. H. Bushnell shot well, scoring 45, 46 and 48 with the military arm.

The cash prizes on flags (inch centers) were valuable this month, a flag being worth over $6; F. O. Young had two of them, while Adolph Strecker had another.

In the 50yds. range, .22-caliber rifles, the competition is very spirited. The leaders for the men's medal are E. Jacobson and Ed. Hovey; Mrs. L. J. Crane is well to the front for the ladies' medal. To-day Mrs Crane did some capital work, bringing out three flags consecutively for inch centers, scoring 9 points.

The scores in the different contests were as follows:

Rifle, 200yds., Unfred diamond medal, three shots, re-entry—W.

Glindemann 11, Dr. L. O. Rodgers 12, F. O. Young 13, D. W. McLoughlin 15.

Military rifle, Glindemann medal, 10 shots—F. H. Bushnell 48, F. O. Young 47, E. Hovey 47, J. E Gorman 45.

Rifle record, 10 shots—F. E. Mason 70. F. O. Young 81.

Most flags during the month—F. O. Young 2, A. H. Strecker 1.

Pistol, 50yds., Blanding medal, 3 shots re-entry—J. E. Gorman 8, 12, 14; F. H. Bushnell 9, 11, 14; F. O. Young 9, 11.

Pocket revolver, Carr medal, 5 shots, re-entry—A. H. Pape 65, 66.

All-comers, .22-caliber rifle, Rogers medal, 5 shots, re-entry—E. Jacobson 9, 10, 11; Mrs. L. J. Crane 9, 11, 12; Mrs. C. F. Waltham 23, 41; Mrs. M. J. White 12 17.

All-comers, revolver trophy, 6 shots—J. E. Gorman 41, 47, 48; H. J. Wicker 66.

Glindemann ladies' trophy, 10 shots, .22-caliber rifle—Mrs. C. F. Waltham 51; Mrs. L J. Crane 32, withdrawn; Mrs. M. J. White 36, withdrawn.

NORDDEUTSCHER SCHUETZEN CLUB.

The members of the Norddeutscher Schuetzen Club had some lively competitions in the class medal contests. W. Glindemann was the winner in the champion class and now becomes the owner of the medal. Scores:

Champion class: W. Glindemann, 420 rings. First class: Not filled. Second class: A. Hagerdorn, 362 rings. Third class: D. Schnikel, 358 rings. Fourth class: Ed Stehn, 302.

Best first shot: D. Schnikel 24. Best last shot: W. Glindemann 22.

GERMANIA SCHUETZEN CLUB.

The members of the Germania Schuetzen Club held their regular bullseye contests for cash prizes to-day. The winners, with their best bullseye as shown on the measuring machine, were:

1. C Thierbach	438	5. F H Bushnell	941
2. F P Schuster	502	6. D B Faktor	943
3. R Finking	640	7. W Garms	1094
4. Dr L O Rodgers	794	8. L N Ritzan	1165

SAN FRANCISCO SCHUETZEN VEREIN.

The bullseye contests decided to-day by the members of the San Francisco Schuetzen Verein resulted as below, the winners being given in order of merit, together with their best bullseye as shown on the measuring machine:

1. A H Pape	113	11. C Thierbach	609
2. J Tiedemann	372	12. H Stelling	685
3. C F Rust	402	13. H Zecher	707
4. F Koch	406	14. D B Faktor	758
5. H Huber	467	15. F P Schuster	758
6. A Mocker	538	16. Otto Lemcke	792
7. W Garms	540	17. H H Burfiend	839
8. L Haake	558	18. A Browning	841
9. R Finking	565	19. G A Schultz	953
10. A Jungblut	584	20. H G Hagerdorn	982

ROEEL.

Ross again Wins the Championship.

THE attendance at Cypress Hills Park, Brooklyn, N. Y., on Election Day, Nov. 3, was decidedly flattering to the management. It was not only a great shoot in point of numbers; the caliber of those who took part in the contests was beyond question. Ross again vindicated his claim to the championship by beating out all his opponents, although he was closely followed home by M. J. Dorrler. The Brooklyn *Eagle* of Nov. 4 gives the following account of the shoot:

"F. C. Ross won the 100-shot individual rifle championship which took place at Bookman's Cypress Hills Park yesterday under the auspices of the Zettler Rifle Club. All the local cracks were in evidence, including champion Fred C. Ross, Ignatz Martin, Geb. Krauss and M. B. Engel, while the New York contingent included Gus Zimmermann, Henry Holges, C. G. Zettler, B. Zettler, H. D. Müller, Dr. Boyken and Bernard Walther. New Jersey was looked after by G. W. Plaisted and M. J. Dorrler.

"The contest took place at the ring target, 200yds. range, off-hand shooting, and the number of entries was just twenty-six. The entrance fee was $5 and this money was divided half winners and half losers. As there were twenty-six entries, thirteen divided the money and thirteen got nothing The two prizes offered were a handsome trophy, presented by Gus Zimmermann, and another by J. Bookman. Zimmermann's trophy was for the best score for 100 shots and Bookman's for the best 10-shot score. Another condition was that if the man winning the Zimmermann trophy also made the best 10-shot score, then the Bookman trophy should go to the man making the next best 10-shot score.

"The targets were thrown open for practice at 9 A. M., and an hour later the match began with M. A. Brendel at the score. Without any break the shooting was kept up till 5 o'clock, and then it was found that Frederick Ross had again won the championship and the Zimmermann trophy with a total of 2,225 out of a possible 2,500 points. Michael J. Dorrler was second with 2,184, while George Schlicht, the Guttenberg crack, finished third with 2,157. The other scores of those who finished were: George W. Plaisted 2,134, H. M. Pope 2,112, Chas. G. Zettler 2,099, Henry Holges 2,096, Bernard Zettler 2,066, H D. Spencer 2,053, L. P Hanson 2,051, Gustave Worn 2,015, H. D Müller 1,998, Sam Scott 1,975, R. A. Busse 1,959, Joseph Blumenberg 1,954, A. Kromberg 1,922, G. P. Williams 1,837.

"In the contest for the Bookman trophy for the best 10-shot score, Ross headed the list with 231 points out of a possible 250, but as he had won the Zimmermann trophy the Bookman prize went to Mike Dorrler, who made 230 points, the next best score for 10 shots."

Cincinnati Rifle Association.

CINCINNATI, O., Nov. 1.—The following scores were made by members of the Cincinnati Rifle Association to-day. Conditions: 200yds., off-hand, at the Standard target, 7-ring black:

Wellinger.

9 10 10 6 8 9 9 7 5 8—81 — 9 7 9 7 10 7 9 8 7 7—80

Dinner to the Team of the 13th Regiment, N. G., N. Y.

CAPTAIN J. A. H. Dressel, I. R. P. of the Thirteenth Regiment, N. G., N. Y., entertained as his guests on Saturday night, November 7, the members of his team in the recent matches shot at Creedmoor. The dinner took place at Wilson's, Fulton street, Brooklyn, N. Y., covers being laid for twenty. Of the twenty, all showed up except "U. M. C." Thomas, the expert of the U. M. C. Company, of Bridgeport, Conn., of which company Captain Dressel is president.

The list of guests present included the following officers, non-commissioned officers and privates of the Thirteenth Regiment: Col. W. L. Watson, Lieut.-Col. C. H. Luscomb, Captains J. T. Jennings and H. P. De Forest; Lieutenants J. T. Ashley, S. Fahnestock and T. Austin; Sergeants T. M. Harvey, Val Werner and William Donaghy; Privates James McNevins, F. P de Vigne, George G. Constable, A. Gripel and W. T. Crane. Among the citizen guests was Ed. Taylor, of the Laflin & Rand Powder Company.

Lieut.-Col. Luscomb was toastmaster, and saw to it that nobody whom he called upon to speak was allowed to sit down without saying something. The tone of the speeches was decidedly complimentary to the Inspector of Rifle Practice, to whose efforts and attention to the work he undertook was attributed the better showing made in recent matches by the members of the Thirteenth Regiment's team. As usual with similar gatherings at Wilson's, the proprietor left nothing undone to make everything pass off pleasantly. To Lieut. Austin much also is due for the accomplished way in which he handled the piano. Taken altogether it is hard to realize a pleasanter gathering, or one more likely to create and foster good feeling among the members of the team, officers and men. If one-half the promises of assiduous attention to practice made on that night are kept, the opponents of the Thirteenth Regiment's team at Creedmoor will have to look to their laurels next year.

Trap-Shooting.

If you want your shoot to be announced here send in notice like the following:

FIXTURES.

Nov. 18.—HAVERHILL, Mass.—Fifth tournament of the Massachusetts State Shooting Association.

Dec. 1-3.—TRENTON, N. J.—Proposed contest for live-bird championship; 100 live birds per man, $100 entry. Under the management of Charles Zwirlein.

1897.

Jan. 4-5.—PRESCOTT, Arizona.—Fourth annual tournament of the Arizona State Sportsmen's Association, under the auspices of the Prescott Gun Club. Roy Hill, Sec'y.

January.—SAN ANTONIO, Tex.—Second midwinter tournament, under the management of Oscar Guessaz, etc.

February-March.—HOT SPRINGS, Ark.—The Arkansaw Traveler's first grand annual live bird tournament; $10,000 in purses and added moneys. Souvenir programmes ready Jan. 1. Address all communications to John J. Sumpter, Jr., Box 111, Hot Springs, Ark.

March 23-25.—NEW YORK CITY.—The Interstate Association's fifth annual Grand American Handicap at live birds.

April 15-17.—SAN ANTONIO, Tex.—Tournament of the San Antonio Gun Club. Open to amateurs only. Willard T. Simpson, Chairman Ex. Com.

May 11-14.—OIL CITY, Pa.—Seventh annual tournament of the Pennsylvania State Sportsmen's Association, under the auspices of the Oil City Gun Club. Targets and live birds. Black powder barred. Special event: 25 live birds per man, $25, $1,000 guaranteed. Send entries to H. C. Reeser, Sec'y, Oil City, Pa.

June (third week).—CLEVELAND, O.—Fourth annual tournament of the Chamberlin Cartridge and Target Company.

DRIVERS AND TWISTERS.

It seems that the present system of not allowing contestants in target handicap races to know their handicap until they have shot at the last target of their allowance has its parallel in certain bicycling races in Australia. The New York *Evening Sun* of Nov. 5 has the following item in its column of news for bicyclists: "The 'loafing' methods adopted by some contestants in cycle races," says a cyclist, "and notably in long events, where the real race does not begin until the last quarter is entered upon, when it is a dash for the tape, are frequently unfavorably commented upon by spectators at race meets. The leading event at a recent cycle meet held in Australia was a 'secret distance race.' The distance of the race was known to the track officers only, and was decided upon after it was started. The men raced around the track, and when the starter's gun was fired the race ended. The man in the lead at that point was the winner, and the other men obtained prizes according to their places. In a race of this kind the men are bound to keep sprinting from the start, each man striving to maintain the lead, as he can never tell when the race will end. The racing is therefore bound to be interesting to the crowd, as it does away with all pacing and time limits." The "secret distance bicycle race" is closely allied to the "secret handicap allowance target race."

We have received the following notice from the Bergen County Gun Club, of Hackensack, N. J., regarding the conditions under which the "amateur championship" cup, donated by *Recreation* Publishing Company, is to be competed for: "Contestants for the cup must be members of New Jersey gun clubs in good standing There will be seven contests for the cup, held every other month, the first to take place Dec. 12, 1896. All contests shall be on the grounds of the Bergen County Gun Club, at Hackensack, N. J. The person winning the cup the greatest number of times shall be the champion target shot of New Jersey, and the cup representing the same shall be awarded to him. All contests will be at 100 targets, 50 at known traps and angles, and 50 at unknown angles. Ties may be shot off at the option of the club. $5 shall be awarded at each shoot to the second gun. The price of the birds will be remitted to third gun. Entrance $2, or price of birds. Optional sweep on each 50 targets may be arranged as desired. Gentlemen regarded as absolute professionals will be debarred, and their names will be announced in time to avoid any inconvenience." The trials of a trap editor are many! Up to date we have had professionals—expert and semi-expert. Here's another class—"the absolute!" The next should be the *Ultima Thule*. Trot him out.

We have received a programme of Charlie Zwirlein's big shoot at the Interstate Fair grounds, Trenton, N. J., Dec. 1-3. The first event is a 25-bird handicap, $25 entrance, birds extra at 25 cents each, handicaps ranging from 28yds. to 32yds.; three moneys, 50, 30 and 20, a forfeit of $10 to accompany each entry. Two sets of traps will be in operation, and extra events will be arranged to suit contestants. On the second day will be shot the championship event at 100 live birds, $100 entrance, birds free, 30yds. rise all, A. S. A. rules to govern, one money (high gun to take all). The Austin Cartridge Company will donate a challenge trophy to go to the winner. In regard to the purse in the championship event, we have grave doubts as to the wisdom of making only one money. One thing is sure, however: one money in such an event makes a purse worth winning.

A match is being shot to-day on the Westminster Kennel Club's grounds, Babylon, L. I., between George S. McAlpin, of the Carteret Club, and John L. Winston. The grounds of the club are as fast as any in the country, while George S. Mott, the club's manager, has the reputation of selecting and trapping remarkably fast birds; the boundary also has been reduced to one of 30yds. McAlpin has lately been shooting in much improved form, and his friends are confident of his success; he has done some good work on the Westminster Kennel Club's grounds, and in that respect will have a slight advantage over his opponent, who has never visited them. A lot of interest is shown in the match, Winston's victorious career since his arrival in the East having attracted much attention from the club men in this part.

Pigeon-shooters who aspire to championship honors should not forget that entries for Zwirlein's 100-bird race at Trenton, N. J., close on Nov. 20. If, as we are informed, Dr Carver is shooting in such great form, he will not jeopardize his claims to the championship "of the world" by coming East and taking part in a race with such a solid money prize at the end of it. The prize in cash would be well worth winning, and the Doctor could shoot the race "under protest" so far as his championship was concerned. If he wins he will have further vindicated his right to that title. We have little doubt too that he could arrange a match or two on the side, if he will only come and spend a week or two in the East.

Nate Astfalk and Aaron Woodruff, both of Elizabeth, N. J., went to Class's grounds at Morristown, N. J., Nov. 6, to shoot a race with James S. Timmons and Hathaway, both of Morristown. The conditions of the race were 25 live birds per man, $20 a corner. Astfalk and Woodruff won by 2 birds. On the same day Winston shot at 25 specially selected birds, Class betting him the price of the birds that he could not kill 20 out of the 25; Winston made Class pay for the birds by scoring just the requisite number. The outcome of this race was an agreement between the two men that a similar race should be shot in the near future at 50 birds, Class to furnish them. A bet of $50 depends on whether Winston can score 40 out of the 50 birds. A forfeit was put up to bind the match.

Drivers and Twisters were a little scarce in our last issue, and we know just whose fault it was. One can't go climbing up and falling down the Jersey mountains in pursuit of ruffed grouse for a few days without running the risk of our pet column getting into disgrace. And anent those same ruffed grouse: It's no joke trying to get the best of a Jersey grouse on a Jersey mountain when the rocks are slippery and the leaves as dry as a chip, owing to two or three days of as fine Indian summer weather as ever fell to the lot of a hunter. No wonder Drivers and Twisters were scarce.

Bland Ballard, who won the championship of Kentucky a few days ago, did some good shooting before he became entitled to the name of champion of Kentucky. He ran 24 out of 25 live birds, and then ran 15 straight in the ties. He used, we believe, the old Greener with which he helped A. L. Ivins to defeat the Hoey-Murphy team at Elkwood Park about 14 months ago.

The annual meeting of the Interstate Association will be held at Taylor's Hotel, Jersey City, N. J., on Thursday afternoon, Dec. 17. The Association will have a lot of important business to consider, as its efforts in the line of creating interest in trap-shooting by giving a series of tournaments "for sport" have passed the elementary stage. The choice of a circuit for 1897 will be a hard nut to crack.

A. W. du Bray is bubbling over with joy at the way in which the Parker gun came to the front at the Kentucky Gun Club's shoot at Louisville, Ky., and at the Macon, Ga., Gun Club's all-day shoot at live birds. And, by the way, the boys at Macon seem to have the support of the shooters of that district; an entry list of 18 in a 25-bird race is not to be sneezed at.

Rolla Heikes has made a new record, breaking 100 targets out of 105 shot at in 3m. 7s. The feat was accomplished on the grounds of the Cleveland, O., Gun Club, and was made on targets thrown from a magautrap.

We have received a very interesting communication from Roger Van Gilder, the popular secretary of the Knoxville, Tenn., Gun Club, giving in full his ideas as to "Programmes and Tournaments," and also telling in detail how to run one. Owing to the great pressure on our trap columns this week we are unable to give our readers the benefit of Mr. Van Gilder's experience in the current issue. By the way, there's a comet on the trap-shooting sky; it's headed toward Knoxville, and will, if our calculations are not in error, reach there some time in May, 1897. That comet has a long tail, composed entirely of crackerjacks—about 150 of them too!

We understand that Winston has posted a forfeit to shoot Carver a race when the Doctor comes East on his way to Europe. Winston wants Carver to shoot him a race on the first Saturday in December at 100 live birds on Zwirlein's grounds at Yardville, N. J. If Carver accepts this offer Winston states that he will wager $147 to $100 that Carver will not take the "cast iron badge" to Europe with him if the ownership of that badge depends on the result of the above match.

John J. Sumpter, Jr., proposes to hold a big live-bird tournament at Hot Springs, Ark., during the months of February and March. The idea is a capital one, and Mr. Sumpter's efforts in this direction should meet with great success. In another portion of these columns we give Mr Sumpter's letter to us in detail. It is well worth reading by all shooters.

W. H. Wolstencroft, of Frankford, Pa., has challenged Dutchy Smith for the Austin Tri-State cup, won by the latter at the shoot at Marion, N. J., Nov. 3. Dutchy has named Nov. 25, 2 P. M., and the Climax Gun Club's grounds at Fanwood, N. J., as the date, time and place for the shoot to take place. The conditions are 100 targets, expert rule, one man up, $25 a side, winner to take the cup and the $50.

Trap-shooting is on the boom in Richmond, Va., the efforts of some enthusiastic lovers of the sport having been successful in creating quite a lot of interest among the shooters of the capital of Virginia. A shoot was held in that city on Oct. 17, at which both English sparrows and pigeons were trapped; the attendance was sufficiently large to hold out hopes of better things to come.

The fifth tournament of the Massachusetts State Shooting Association will be held at Haverill, Mass., Nov. 18, under the auspices of the Haverill Gun Club. In addition to a long programme of 10-target events, there are also the 3-men team race and the individual prize match to be decided.

The second shoot for the cup presented by the American E. C. Powder Company to the Bergen County Gun Club, of Hackensack, N. J., took place on Saturday, Nov. 7. The cup was won by T. Bell, the president of the club.

The first of a series of three races between the Endeavor Gun Club of Jersey City, N. J., and the Bergen County Gun Club, of Hackensack, N. J., ten men to a team, takes place on Saturday, Nov. 14, at Hackensack.

Dr. Wynn, one of the veteran members of the New Utrecht Gun Club and Fountain Gun Club, of Brooklyn, N. Y., and also a member of the Larchmont Y. C., made a record for the grounds of the latter club on Election Day by scoring 50 straight live birds from the 30yds. mark.

In the Yale-Princeton-Harvard team shoot held on Saturday, Nov. 7, on Soldiers' Field, Yale was the winner, Princeton being second, with Harvard third. The scores were respectively 67, 57 and 46.

There will be at least 10 entries in the main event at Zwirlein's tournament, according to figures furnished us. Zwirlein also writes us that he has to date (Nov. 6) 20 entries for the handicap.

Nov. 10. EDWARD BANKS.

Future Tournaments in the South.

VICKSBURG TOURNAMENT.

LITTLE ROCK, Ark., Nov. 6.—Some time ago the Hill City Gun Club, of Vicksburg, Miss., announced that it would hold a tournament on the 5th and 6th of this month. At the last minute the club decided to change the dates, owing to their close proximity to Election Day, and therefore chose the 16th and 17th. The programmes for this tournament are now out, and from the amount of advertisements contained in the same it is evident that an abundance of local interest is manifested in this shoot. The programme calls for ten events each day, 20 targets each, with a uniform entrance fee of $2 50; $10 added in each event makes up the $200 added money which the club promises. All events will be known traps and unknown angles; the Rose system of dividing the purses will be used, but how many moneys there will be it fails to state, though likely not less than five; 10-gauge guns and black powder will be barred, and Mr. Elmer E. Shaner will have charge of the traps and grounds. This assures those who attend that everything will pass off smoothly, and everybody knows how essential this is to help make things pleasant. This is the club's fifth tournament, and all the previous ones were enjoyable and successful affairs. Present indications are that this will be but a repetition of the former ones.

HOT SPRINGS BIG HANDICAP.

The commencement of the new year will doubtless see a revival of big tournaments. The Grand Midwinter will take place in January at San Antonio, Tex. In February there will be a big live-bird tournament at Hot Springs, Ark., the feature of which will be a big handicap race, 25 birds each, $25 entrance, and $12 50 added for each entry; if there should be 100 entries in this event the added money would amount to $1,250, and this with the entrance fees would make quite a nice purse—one well worth striving for. There will be four other handicap events, all with the same number of birds and the same entrance fee, and any number of sweeps. The shoot will last ten days or two weeks, which will probably be the last two weeks in February. The management of the affair will be in the hands of Mr. John J. Sumpter, Jr. (the only Arkansaw Traveler); this alone should insure its success, as all those who are acquainted with John know that he is thoroughly familiar with all the details of this great game of ours.

ANNIE OAKLEY AT HOT SPRINGS.

Miss Annie Oakley and her husband are now stopping at Hot Springs, Ark., as the guests of Mr. John J. Sumpter, Jr. They will remain until about the end of the month. On Thanksgiving Day Miss Oakley will give an exhibition at Hot Springs, and in addition to her fancy trick shooting she will give John J. Sumpter, Jr., an object lesson in the art of killing pigeons. They will shoot a little race, 25 birds each, and John had better look out for his laurels, or Miss Annie will walk off with his scalp. This is no phantom. PAUL R. LITZKE.

Country Club, of Westchester, N. Y.

NEW YORK, Nov. 3.—The Election Day shoot at the grounds of the Westchester Country Club was well attended. A full day's sport was enjoyed by those present, nineteen miss-and-outs being decided during the day. One or two of the events were allowance handicaps, those who stood at 28yds. or back of that mark shooting miss-and-out, 27yds. and under receiving a miss as a kill. Mr. Seaver Page, who has done very little trap-shooting since his severe illness last winter, was on hand and did some good shooting, especially toward the close of the day. The scores in the different events were as follows:

Events:	1	2	3	4	5	6	7	8	9	10	11
W G Brokaw (29)	3	1	11	1	5	2	4	1	0	6	8
J Seaver Page (28)	2	3	3	1	1	5	5	1	4	0	8
W H Stafford (27)	2	4	9	4	1	5	0	3	3	2	8
A Hooper (28)	1	4	5	0	5	5	0	1	3	1	7
H B Gilbert (29)	3	3	11	3	4	2	5	2	4	5	3
H S Redmond (26)	..	3	1	4	0	2	3	3	1	3	1
P H Adee (27)	..	..	..	..	..	0	..	..	..	1	..
W S Edey (28)	..	..	..	..	..	0	3	..	..	..	..
H A Butler (28)	..	..	..	..	..	3	5	2	2	6	2

Other sweeps, all miss-and-outs, were divided as follows:

Stafford and Redmond divided the 12th event, Gilbert and Hooper divided the 13th event, Stafford, Hooper and Gilbert divided the 14th event, Page and Stafford divided the 15th event, Hooper won the 16th event, Page, Stafford and Hooper divided the 17th event, Page, Gilbert and Butler divided the 18th event, Stafford and Butler divided the 19th event.

Country Club, of Hanover, N. H.

HANOVER, N. H., Nov. 2.—The sweepstakes shoot of the Hanover Country Club brought out but few shooters, as the weather was very threatening. The scores made were poor, owing to the heavy wind that blew across the grounds. Mr. M. R. Beaudoin-Bennett, who acted as referee and scorer, is also an expert with the gun. Mr. Deas Murphy holds the club record of 96 out of 100, 21yds. rise, unknown angles. The club, although a young organization and devoted to fox hunting, polo, golf, etc., has also a large number of members who are much attached to the trap-shooting department. The shoots are held regularly on Mondays, Wednesdays and Saturdays at 1 P. M. To-day's scores were as follows:

Thirty targets, 21yds. rise, unknown angles:

Deas Murphy ..... 1011111111111111100011111111101—25
1111110110110011110000111101111—21—46
W Boetzkes ..... 1110101111101111111110110111100—23
1110011011100101011001111111011—20—43

In a 15-target race, same conditions, Murphy defeated Boetzkes by he score of 14 to 9.

Tournament at Ironton.

IRONTON, O., Oct. 28.—Yesterday, the first day of the Iron City Gun Club's tournament, opened in anything but an auspicious manner as far as the weather was concerned. A cold, steady rain fell during the morning and made shooting decidedly unpleasant. After dinner it cleared up nicely and enabled the club to throw about 2,500 targets.

Shooting was very difficult on account of the dark background and the rapid flight of the bluerocks. The excitement of the approaching election had the effect of keeping away dozens of sportsmen who had signified their intention of attending, but taking all things into consideration the shoot was a most decided success. All appointments were of the best, ample protection having been provided in the shape of a commodious club house and two large tents, one being used by the caterer and the other by that most efficient, handsome and obliging treasurer, George H. Gray. Everything passed off without a hitch of any kind, and too much credit cannot be given to those whose services and close attention in managing the shoot elicited so many profuse and complimentary remarks. Ezra Dean and Joe Rogers were constantly on hand working hard, but to Howard E. Norton belongs the greatest credit, he having visited numerous tournaments and individually invited his hosts of friends to attend this shoot. During the entire time he did yeoman work, always alert to the comfort and enjoyment of the visitors, among whom were: R. L. Trimble, of Covington, Ky., representing the Du Pont and Hazard powder companies; Milt. F. Lindsley and John H. Mackie, representing the King Powder and Peters Cartridge companies, of Cincinnati; Frank Alkire, of Woodlyn, O.; Dr. William Shattuck, of Cool Grove, O.; Capt. A. W. West, A. M Glockner and P. Conley, of Portsmouth, O.; P. Schlicher and C. E. Verges, of Marietta, O.; L. P. Stevens and Robert Clark, of Parkersburg, W. Va.; E. E. Douthit, Dr. Vickers, Dr. Sample and L. A. Wolcott, of Huntington, W. Va.; F. Bibbee, of Elba, O., and others from this city.

The live-bird match between Capt. A. W. West and C. E. Verges on one side and L. P. Stevens and Robt. Clark on the other (for $200 per team) proved the drawing card of the second day, hundreds of spectators being present. Special attention must be called to the perfect work done by Verges; he made some difficult shots and succeeded in scoring 25 straight, landing his side easy winners. During this match all four gentlemen used Du Pont powder loaded in Winchester Leader cases. Mr. Verges also used a Winchester repeating shotgun, which he handled with judgment.

Of those present 7 used Winchester guns and did the most vigorous and effective work, viz.: Trimble (who won high average both days and killed all the pigeons he shot at), Norton, Wolcott, Glockner, Bibbee, Conley and Verges. All excepting 3 used Du Pont and Hazard Smokeless loaded in Leader cases. Following are the scores for each day:

First Day, Oct. 28.

Events:	1	2	3	4	5	6	7	8	9	10		
Targets:	10	15	20	10	15	25	10	15	10	20	Shot at.	Broke.

CLAY BIRD.

Macon Gun Club.

MACON, Ga., Oct. 29.—To-day the Macon Gun Club gave a shoot at pigeons that was greatly enjoyed by the participants and proved beyond question that such events can be brought about wherever there is a leading spirit to steer. In this case Messrs. Baker and Etheridge were the pilots, and very creditably did they acquit themselves.

The weather was splendid, with a good breeze to help along a lot of birds that needed no great assistance. The arrangements were good in every particular, and no complaint was heard at or of anything during the day, excepting perhaps chagrin may have been expressed at the short duration of all good things mundane; but for that Mr. Baker can't very well be held responsible.

Well, some one must put his shoulder to the wheel and do some grinding to successfully give a tournament, so in this case Messrs. Etheridge and Baker locked horns, as it were, and in double yoke went at it in earnest, and so well and faithfully did they pull together that not a single hitch occurred during the whole day.

Mr. Tom Callender, of Nashville, who occasionally converses in whispers on the merits and excellence of W-A powder, was there to show how nicely he and it work to a charm in stopping pigeons. Mr. Porterfield made some original and playful remarks about Du Pont Smokeless, and from the way in which he smashed his first ten birds there really wasn't much to be said in corroboration. Then Mr. Irby Bennett riddled a lot of pigeons very deftly, even to plugging them with his second shot, and accurately too at that.

But Mr. Baker worked and sawed wood, and Mr. Etheridge labored and hoed corn, and when one conscientiously saws wood and honestly hoes corn it is hard to shoot pigeons all at the same time, especially good pigeons, chocolate-colored chaps (not coffee-coaters), but good, swift, lively birds; so please remember these little incidents while looking over the scores.

Macon does not give very many tournaments, nor does it attract men from great distances, as no purses are hung up, but if anyone happens to be in the vicinity of that place when a shoot is given, it is just as well to go because then you will be well received by the sportsmen of the town. By the way, the Hotel Lanier is kept by Mr. Sperry, a thorough sportsman, who will cheerfully and most agreeably entertain anyone who happens to drop in. One sportsman soon knows another, so just say dog or gun in Mr. Sperry's hearing and forthwith you are most welcome.

Mr. Ruble did splendid work all along, winning the Butts medal given to the man making the highest score in handicap event for members of the Macon Gun Club; his gun and load did great work all along.

Should these lines meet the eye of anyone undecided as to whether he will go to the Vicksburg tournament, let him rest assured he can make no mistake in going to it. Vicksburg is peopled by a lot of hospitable, good-hearted souls who will gladly welcome any stranger that enters their gates, and no one, if of the right stripe, can ever regret having been there. Like dear old beloved Natchez, it is a Mississippi River town, and a word to the wise is sufficient. Some of the best and most important tournaments ever given in the South were held at Vicksburg, and that is saying a good deal when we remember how well the South stands in that particular.

RAVELRIGG.

At the Larchmont Traps.

NEW YORK, Nov. 3.—The opening of the season at the Larchmont Yacht Club's shooting grounds to-day was marked by some excellent work on the part of Dr. Wynn, of Brooklyn, who scored 50 live birds straight. Only three shooters were present, the scores in the two 25-bird races, 30yds. rise, being as follows:

No. 1:

Dr Wynn.....2222111121222221121122212—25

McIlhany still Champion of Kansas.

WEIR CITY, Kan., Oct. 26.—C. H. Calhoun, of this place, to-day endeavored to wrest the trophy emblematic of the live-bird championship of Kansas from W. W. McIlhany, also of this city. It will be remembered that McIlhany won the trophy from Calhoun on May 5, and has since defeated Ben Best, of Columbus, who challenged for it.

The weather to-day was absolutely perfect for an event of this kind, and a large number of spectators were on hand to witness the match. The race itself was scarcely an interesting one. Calhoun began to lose birds early in the race, and after the fifteenth round the result was hardly in doubt. The first round of 25 found McIlhany four birds in the lead, as he was shooting in great form, while on the other hand Calhoun was badly off, his work being very ragged. In the next string of 25 he improved somewhat and made a run of 16 straight, but this piece of good shooting was spoiled by some hard luck, for when it looked almost certain that he would run out straight he lost two of his last three birds dead out of bounds. This, however, could not have had any bearing on the ultimate result of the match. While Calhoun was making a fast pace McIlhany was even exceeding it; he ran 17 straight and went out with 22, exceeding his opponent by one bird on the string, defeating him by five birds, the total score standing, McIlhany 46, Calhoun 41. Only one of McIlhany's birds escaped, as three of his lost birds fell dead out of bounds; Calhoun lost the same number under these conditions. The birds themselves were an ordinary lot, some few were exceptionally fast, while others again must be classed as duffers.

The conditions of the match were: 50 live pigeons, A. S. A. rules, challenger to put up $25 against the trophy, winner to take trophy and money, loser to pay for the birds. W. G. Sergeant, of Joplin, Mo., acted as referee. McIlhany shot a Parker gun, Smokeless shell and Schultze powder; Calhoun shot a Greener gun, Smokeless shell and Du Pont powder.

PAUL R. LITZKE.

Heikes Makes a New Record.

CLEVELAND, O., Oct. 30.—Rolla Heikes has been here on his round of exhibitions with Bartlett that these two have been giving in this State, and we gave him a chance to see what he could do in the way of fast shooting over a magautrap. Bartlett was, unfortunately, called home from here on account of sickness at home, so we failed to see him in his specialties.

The Cleveland Gun Club had its regular shoot yesterday and in addition a handicap merchandise shoot. I inclose the scores of the club contest, but have not the scores of the merchandise race. There were twenty-four entries in each race, and in the two races and ties between 1,500 and 1,600 bluerocks were thrown from a magautrap in two and one-half hours, which is very fast work.

It was quite late and very dark when the shooting was over, and Heikes did his shooting, but in spite of the darkness he shot at 75 bluerocks and broke 65 in 2 minutes and 40 seconds. On account of the darkness he could not make as good time as usual, and at the request of several of the members he stayed over another day to make another trial.

This morning at 10:30, everything being ready and having four Winchester repeaters all loaded, with Mr. Jenkins, inventor of the magautrap, and Mr. Baker to help to load the guns, Mr. Morris to score and myself to time and pull the trap, which was run by Wm. Cottshott, the club's trapper, Heikes called "Pull" and the race commenced. For some reason he missed three of the first four shot at and stopped and made another start.

Everything being ready, again Heikes called "Pull" for the first shot. I counted 1, 2, 3, 4, 5, 6, pulling the trap at the same time, and repeating the count each time he took up a new gun, so as to keep him posted as to the number of shots fired and not cause delay by his getting confused by not emptying the magazine or trying to shoot after it was empty.

The trap was pulled regularly and at the rate of about six targets in four seconds, and the machine-like way in which Heikes picked up and emptied the magazines of the four guns was a marvel. The bluerocks were thrown 45yds., slightly left-quartering on account of that being the best direction to throw, considering the very high wind that was blowing. The first 63 were simply smothered before a miss occurred, all within what seemed to be about a foot of the same place, and the 100 were broken out of 105 shot at in exactly three minutes and seven seconds. The magautrap, the guns and the man worked without a balk of any kind, and all seemed to be a piece of the same machine.

It seems almost incredible that any one could shoot so rapidly and accurately under the strain necessary to perform such a feat, and it is certain there is not another man in the country or the world that can equal it.

Mr. Heikes shot Winchester factory-loaded ammunition in Leader shells, with 42grs. E. C. powder and 1¼oz. 7½ chilled shot.

PAUL NORTH.

A Good Programme at Hot Springs.

JOHN J. SUMPTER, Jr., known to the boys as "The Arkansaw Traveler," has been doing some thinking at his home in Hot Springs, Ark., with the following result, which he has put on paper in a letter to FOREST AND STREAM: "In your trap columns will you kindly announce: 'February and March, 1897. The Arkansaw Traveler's First Grand Annual Live-Bird Tournament at Hot Springs, Ark.; $10,000 in purses and added money. Souvenir programmes ready January 1, 1897. Address all communications to John J. Sumpter, Jr., Box 111, Hot Springs, Ark.'"

In explanation of his scheme, Mr. Sumpter further writes: "I expect to have two weeks or more of strictly live-bird shooting, with four events of twenty-five birds each, $25 entrance, and $500 guaranteed. These events will be handicaps, and will be known respectively as the Arlington Hotel handicap, Southern Club handicap, Eastman Hotel handicap, and the Arkansaw Club handicap. As an inducement for shooters to remain until the finish, I propose to wind up with a 'Grand Hot Springs Handicap,' twenty-five birds, $25 entrance. For every two entries who shoot the entire twenty-five pigeons in this event I will add $25 in cash (silver or gold).

"I will write you further, giving full particulars and exact dates. At this time I think it best to commence the last week in February, continuing until the first week in March, or as long as the boys want to shoot. This is going to be a strictly dead square shoot (like the Du Pont-Chicago one, for instance); a gentleman's shoot; where a shooter can use any kind of a gun or powder he chooses (except black). Black powder will have to be barred, as deer and turkey are plentiful near by, and we do not like to have 'soft coal fiends' scare them all out of the country. The programmes will be the finest ever gotten out by any club or association, and we expect to have 15,000 run off. They will be sure enough souvenirs and don't you forget it."

The above outlines Mr. Sumpter's ideas on the subject of a big shoot for Hot Springs. The schedule of events seems to us likely to prove a very drawing one. The time of year suggested by the "Arkansaw Traveler" is a very good one. Southern shooters in particular can go to Hot Springs and make enough money to come up to New York, see the Sportsmen's Exposition in Madison Square Garden, and then make expenses the following week by winning the Grand American Handicap. The same applies to Western shooters, especially the shooters of the famous "Indian squad," whose prowess with the gun at the "circuit tournaments" of 1896 is not forgotten by any of those who attended the said tournaments. The North and East will unquestionably be represented at Hot Springs. They will come back to shoot in the Grand American even if they have to "hoof it." In short, we have seldom seen a programme that seems on its face to be as sure of ultimate success as this production of Mr. Sumpter's thought.

C. J. De Roo, secretary of the Holland, Mich., Gun Club, writes us as follows under date of Oct. 30: "The match which was to have come off to-day as the result of a challenge issued by the Valley City Gun Club, of Grand Rapids, to the Holland Gun Club, of this city, for the State team championship and *Shooting and Fishing* cup representing same, did not take place, as only two members of the Grand Rapids team appeared on the grounds. The cup therefore remains with our local club. Those present shot six 10-bird sweepstake races, but owing to the high wind and cold weather scores were very low, and only one straight 10 was made during the day; this was made by Mr. A. E. Ferguson, of the local club. Messrs. Bush and Vosburgh, of Kalamazoo, and M. K. Walton, of Grand Rapids, were among our visitors.

In New Jersey.

ELIZABETH GUN CLUB.

Oct. 28.—The second day of the Elizabeth (N. J.) Gun Club's eighth bi-monthly tournament was favored with fine weather. There was also a satisfactory attendance of shooters, all things considered.

The three events on the programme were: No. 1, 7 birds, $5; No. 2, 10 birds, $5; No. 3, 25 birds, $10, birds extra. In event No. 3 three men killed their 25 straight. These men were Brewer (32), Class (31) and Woodruff (30). Wheeler fell in for second money alone on 24 out of 25, while Ferd. Van Dyke and M. Herrington divided third money on 23 each. The scores in the different events were as follows:

No. 1, 7 birds: Baker 7, Class 7, Timmons 7, Winston 6, Saunders 3.

No. 2, 10 birds: Winston 10, Astfalk 10, Timmons 9, Zwirlein 9, Baker 8, Class 8.

MATCHES AND SWEEPSTAKES AT ZWIRLEIN'S.

Oct. 30.—J. L. Winston, the Eastern representative of the Austin Powder Company, of Cleveland, O., shot a couple of small races to-day on Charlie Zwirlein's grounds, at Yardville, N. J. The first match was with the proprietor of the grounds himself, Charlie Zwirlein, the conditions being 25 live birds per man, $25 a side. In this match Winston was an easy winner, Zwirlein being out of all form and retiring at the end of the 20th round, 5 birds to the bad. In the second match, 50 birds per man $50 a side, Winston met George Cubberly, one of the most reliable pigeon-shooters in this part of the country. On the first 25 Winston led by 2 birds, but in the last string Cubberly pulled up on him and only met defeat by the narrow margin of 44 to Winston's 45.

Winston's shooting to-day was remarkable, as, in addition to scoring 63 out of 70 birds in the above two matches, he was a winner in every sweep shot during the day, making a straight score of 64 kills in the eight sweeps. The scores in the matches were as follows:

Winston vs. Zwirlein.

J L Winston.....2200222222222222222—18
Chas Zwirlein.....0102020022210222201 2—13

Winston vs. Cubberly.

Cubberly	110	211122220	12121	1112121
Hill*	.....	20	10	2222210

* Hill missed his first birds in both Nos. 7 and 8 and re-entered, with result as shown above.

TWO INTERESTING EVENTS AT MARION.

Nov. 3.—Two interesting events were decided to-day on the grounds of the Endeavor Gun Club, at Marion, N. J. The first was an individual match, 100 targets per man, expert rules, one man up, $25 a side, the principals being 147 (Jack Winston) and H. G. Wheeler, of Marlboro, Mass., now on his way to spend the winter in the South. Both men shot poorly, Winston finally winning by 6 breaks with the score of 75 to 69. It is true that the light was very trying and that the targets were thrown very low and fast, but it seems odd that both men should shoot so far below their true form. Wheeler had a hoodoo that prevented his breaking the target from No. 4 trap, whether it was pulled first or last. We have an idea that he missed that one target about 16 times out of the 20 it was pulled for him. The scores in this event were as below:

Winston .....1110101111110101111110110110110110110111111110011—38
1110011111111000101110000011111111111101111111110—37—75
Wheeler.....1101110011100110111111010110100111111100101001011—33
1100010111010111110190111101101101111111011111011—36—69

Platt Adams acted as judge for Wheeler, H. S. Welles watching the targets on behalf of Winston. Carl von Lengerke occupied the dual position of referee and scorer. Tominy pulled the traps and worked the indicator.

Several sweepstakes followed, all at unknown angles, and then came the real event of the day,

THE TRI-STATE CHAMPIONSHIP AT EXPERT RULES,

for a silver cup donated by the Austin Powder Company, of Cleveland, O. While the cup is taken as emblematic of the tri State championship at expert rules, it loses part of its prestige as such from the fact that contestants for the cup must always shoot a certain powder, the "147" load. It is a handsome trophy and can only become the absolute property of the holder when one defends his title to it successfully for six consecutive months. It is subject to challenge every thirty days, thus a man may have to defend it five times before becoming owner of the same.

The number of entries for this event was small, but this was only what one could expect, duty to one's country keeping many a would-be contestant away from the traps to drop a ballot in the box for McKinley or Bryan. Among those who took part were Charlie (Dutchy) Smith, of Plainfield, N. J.; Billy Wolstencroft, of Philadelphia, Pa; Eddie Collins and Ferd Van Dyke, both good men at this style of shooting; Neaf Apgar, Dutchy Smith's fellow townsman; W. M. Stanbrough, from Newburgh, N. Y.; J. L. Brewer, of New York city; Platt Adams, Duston, Welles, Carl von Lengerke and Edwards. Winston and Mr. Harding, a gentleman from Boston, Mass., a friend of Charlie Budd's, but a beginner at trap-shooting, shot along for "the birds," neither being eligible to compete for the trophy. The conditions of the shoot were: 50 targets per man, expert rules, one man up, $5 entrance, open only to residents of New York, New Jersey and Pennsylvania.

Scores in this event again ruled remarkably low, Winston being on top (but not for the cup) with the score of 39 out of his 50. Dutchy and Brewer tied for the cup on 38 each; Van Dyke and Collins tied for second place with 37, Wolstencroft being third with 35. Collins made a remarkably poor start, scoring only 15 out of his first 25; he then pulled himself together and ran 22 out of his last half, thus landing within 1 of the cup after all. Dutchy and Brewer were tied at the end of the 40th round with 30 breaks each. Out of his next 5 the Plainfield man lost 1, while Brewer broke them all; the latter was thus 1 to the good with only 5 more to shoot at. Dutchy scored all his last 5 and then everybody waited to see what Brewer would do; he broke No. 5, the first trap pulled, and followed it up by smashing into dust the target that went from No. 1. With the two outside ones gone and broken, it looked as if he had the cup sure, but the unexpected happened; his 3d target was from No. 4, Wheeler's hoodoo, and it "got away." He broke the last 2 and tied, as stated above.

The tie was shot off at once at 25 targets each, Dutchy scoring only 19, but winning easily, as Brewer fell down to 15. As stated elsewhere, Wolstencroft at once deposited a forfeit of $10 with FOREST AND STREAM, and issued a challenge to the winner.

The scores in this event were:

C Smith.....0101011111101111101110010111111101100111101111111—38

Mr. Harding broke 9 out of 50.

Shoot-off for the cup:

Smith.....1111010111111011111001110—19
Brewer.....1111001010110011110001110—15

Mr. Henry Febiger, a prominent member of the Keystone Shooting League, of Philadelphia, kindly consented to act as referee. The traps were again pulled by Tommy, while Max Herzig performed the duties of indicator. The latter phrase may sound a little obscure, so a few words explaining the method of using an indicator in this race will not be out of place: Two empty shell-boxes (the usual twenty-five-shell size) were used, a hole being cut in the top of each large enough to admit a hand. Inside one box were placed five wads, numbered respectively 1, 2, 3, 4 and 5. As each man stepped to the score for his five targets Mr. Herzig put his hand in the box and pulled out a wad, showing the number on it to the puller, who pulled that trap when the word was given. This wad was then dropped into the other box if the target was a fair one; if it was a broken target and not accepted by the shooter, the wad went back into the first box and a fresh shake-up given. This method was pursued until all of the five traps had been pulled. Thus a man did not necessarily get the same trap after a balk, although it might happen so. This made the pulling absolutely fair, and eliminated as far as possible all element of chance in the way of balks. The scheme was FOREST AND STREAM'S.

BOILING SPRINGS GUN CLUB.

Nov. 7.—The monthly club shoot of the Boiling Springs Gun Club, of Rutherford, was held this afternoon. The weather was as nearly perfect for trap-shooting as one could wish, hence good scores were the rule. The club event is shot at 50 targets, extra targets allowed the weaker shots. The first 25 is shot at known angles; the second 25 and the handicap allowance at unknown angles. The scores count at the end of the season, a cup being put up by the club, and the man winning it the greatest number of times to become its owner; the club will also divide about $90 in cash among the other winners. The Laflin & Rand Powder Company also put up for competition this afternoon one of its silver kegs of W-A powder, the keg going to the high man in the club event. Baron, with an allowance of 5 extra targets, won the event with a score of 48 out of a possible 55. Huck, the secretary of the club, was second with 46, scoring 21 at known angles, but running 25 straight at unknown angles. Edwards and Winston (147), the latter a guest of the club, broke 45, both making 24 out of the 25 targets at unknown angles. James, one of the veterans of the club, shot well and landed with 45 out of a possible 55. Mrs. M. F. Lindsley, who is a member of this club, paid it a farewell visit this afternoon, it being her intention to return to Cincinnati, O., in a few days. The scores in the club shoot were as below:

T Baron (5)...1111101101111111111111011111111110111111111110111111—44

001010111100011 — 8—29

Winston and Edwards shot a couple of little races at 25 targets each, unknown angles, loser to pay for the targets, with a small consideration thrown in to add to the interest. The result of these matches is given below:

	Twenty-five targets, unknown angles:	Same:
147	.....0110111111111111111111101—22	0110111111111111111111111—23
Edwards	...1111101111111111111111111—24	1111111101011111110110011—20

Sweeps were shot as below, all at unknown angles:

Events:	1	2	3	4	Events:	1	2	3	4
Targets:	*10*	*10*	*15*	*10*	Targets:	*10*	*10*	*15*	*10*

JEANNETTE JAGD CLUB.

Nov. 3.—The Jeannette Jagd Club held its Election Day live bird shoot on the Guttenburg race track. The attendance was very good, 20 members taking part in the club event at 10 live birds per man. Of the 7 men in Class A, 4 made clean scores and shot off, miss-and-out, for the trophy for that class. Brunie fell out in the 7th round, but the other three killed 10 straight; in the 11th round a singular piece of shooting was witnessed, each man losing a bird. As the supply of pigeons was exhausted, the three men drew for the trophy, with the result that Charlie Steffens took it home with him. In Class B Henry Nobel, who is also a member of the New York German Gun Club, and Henry Gerdes tied for the medal; they drew for the trophy, Nobel winning it. The scores were:

Class A, 28yds.:		Shoot for badge.
Chas Meyer	2222111112—10	22222121110
Chas Steffens	1211111111—10	22112111110

EDWARD BANKS.

On Long Island.

PHŒNIX GUN CLUB.

Oct. 28.—Nine members of the Phœnix Gun Club took part in the club's regular monthly shoot, held to-day at Dexter Park. The birds were a good lot of flyers, and although the club mark is 25yds., all on the same mark, 13 out of 15 was the best that any of the shooters could do. "Uncle Billy" Hughes, David Freileigh and E. H. Madison tied for first place with the scores below:

David Freileigh.2201211101121111—13
E H Madison...1111111111111010—13

THE DEXTER PARK TOURNAMENT.

A tournament was given at Dexter Park, L. I., by its proprietor, H. Lippack, on Oct. 29-30, the shoot being under the auspices of the Emerald Gun Club, of New York, an organization that has held its regular monthly shoots at this park for many years. In point of numbers the attendance at this shoot was about an average for small tournaments in this vicinity. The added money was very small, while the races were nearly all 15 and 20 target events, rather too long for the poorer shots to hope to get in for money. In addition to all this, the open season for game is now on and many trap-shooters from New York and Brooklyn are out in the woods after ruffed grouse and woodcock.

First Day, Oct. 29.

Some rattling good scores were made at the target traps to-day. H. G. Wheeler, of Marlboro, Mass.; Ferd Van Dyke, Justus von Lengerke; J. S. S. Remsen, of Brooklyn; J. L. Winston and L. H. Schortemeier, all making high averages. The special feature to-day was an individual match, 50 targets per man, expert rules, one man up, $10 a side, the principals being J. L. Winston and Wheeler. Winston won the match by 1 target, although at the end of the 25th round he was 3 behind Wheeler, and was still 2 behind at the end of the 29th round. The scores were as below:

Winston.....1101110111110111111111101111101111111111111111111111—45
Wheeler.....1111111111111111111101100110111111110011111111111—44

The scores made in the sweeps are given below in tabulated form:

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7
Targets:	*20*	*15*	*25*	*10*	*15*	*20*	*20*	Targets:	*20*	*15*	*25*	*10*	*15*	*20*	*20*
Remsen	20	14	24	..	15	17	20	Smith	15	14	20	10	14	19	1
Van Dyke	19	15	24	10	12	18	20	Wood	14	11	17	..	..	..	..
Wheeler	20	15	24	10	14	20	18	Bristol	17	10	20	..	..	..	..
Von Lengerke	20	13	21	10	13	20	16	Phister	20	11	17	9	13	17	..
Schortemeier.	19	14	21	9	13	19	18	Wanda	..	..	..	..	7	..	..
Winston	16	12	23	9	13	17	20								

Extra targets were shot as below:

No. 1, 10 targets: Remsen 10, B. Amend 8, Schorty 7, Hudson 5, T. Short 4, Wanda 3, W. Amend 1.

No. 2, same: Schorty 9, T. Short 6, B. Amend 4, W. Amend 2.

No. 3, same: Wheeler, Schorty and Bristol 10, Van Dyke, Wood and Remsen 9.

No. 4, 15 targets: Van Dyke 15, Remsen 14, Schorty 12, Bristol 10.

Second Day, Oct. 30.

The weather to-day was extremely fine and warm for the time of year, and the natural consequence was that the birds were not as fast as are usually seen on these grounds. Some big scores were made, Schorty leading with a record of 36 straight (every bird he shot at); Woodruff scored 30 out of 31, and Herrington 24 out of 25. Remsen scored 24 out of 26 shot at. The scores show the results in each race. The Dexter Park Handicap was at 15 live birds, $10 entrance, three moneys; Nos. 1, 2 and 3 were 5-bird sweeps, $3 entrance, and No. 4 a $1 miss-and-out, all at 30yds. The 5-bird sweeps were shot at the 28yd. mark. Scores:

Dexter Park Handicap.	No. 1.	No. 2.	No. 3.	No. 4.

AN IMPROMPTU SHOOT AT WOODLAWN.

Oct. 30.—Three members of the New Utrecht Gun Club held an impromptu shoot at the club's grounds, Woodlawn, L. I., this afternoon. The main event on the afternoon's programme was a three-cornered race at 25 live birds per man, all at 30yds. Dr. W. W Wynn was an easy winner with 22 out of 25. His opponents, Dr. Eddy and W. R. Allen, only scored 17 and 15 respectively. The scores were as follows:

Dr Wynn.....1221120121112101221220121 -22
Dr Eddy.....2121201110022202011220210—17
W R Allen.....1022001210220101020220020—15

HAPPY DAY GUN CLUB.

Oct. 30.—The scores made by the members of the Happy Day Gun Club, of New York city, at their monthly live-bird and target shoot, held this afternoon, were as below:

	No. 1, 8 live birds.	No. 2, 15 targets.
C Rieger	12111112—8	011101011111110—11
Dr Richter	11211222—8	110110110100012— 8

E. WEISS, Sec'y.

CONEY ISLAND ROD AND GUN CLUB.

Nov. 4.—Four members of the Coney Island Rod and Gun Club, of Brooklyn, put in an appearance at Dexter Park this afternoon to take part in the club's regular monthly live-bird shoot. The club event is at 7 live birds per man; this was won by Henry Knebel, Jr., who scored 6 out of his 7. He also won a match at 20 targets, shot after the club race. The scores in these events were as follows:

	Club shoot.	Sweep at 20 targets.
H Knebel, Jr.	1121102—6	11111110111111110110—17
J B Voorhees	1022202—5	.....

Dr Raynor	2210000—3	00011000000011000100— 5

CRESCENT CLUB, OF BROOKLYN.

Nov. 3.—Nine members of the Crescent Athletic Club, of Brooklyn, took part in a small shoot to-day on the club's grounds, the occasion being the formal opening of the shooting grounds for the season of 1896-97, the scores made on targets being as follows:

Events:	1	2	3	4	5	6	7	Events:	1	2	3	4	5	6	7
G C White	19	19	21	..	..	..	19	F U Gregory	3	..	..	..	..	..	..
D G Geddes	16	16	22	21	19	21	17	L C Hopkins	..	9	13	11	..	13	9
G A Street	10	4	..	..	..	..	..	T W Stake	..	8	8	..	..	14	8
W K Kitchen	9	9	..	..	..	..	..	J S Remsen	..	..	..	..	21	24	19	19
H A Growtage	3	7	7	..	..	11	11								

All events were at 25 targets.

Nov. 7.—To-day was the first regular shoot of the Crescent Athletic Club, of Brooklyn, the club shooting every Saturday afternoon during the winter and spring months. The attendance was very light, and Remsen had things all his own way, doing some good shooting, scoring 96 out of the last 100 targets he shot at. Scores:

J S S Remsen.1111111111011011110111111001110011001101111111111—40

MATCH AT FLATLANDS NECK.

Nov. 3.—Messrs. L. B. Hooper, Philip Atchley and J. M. Eggler shot a three-cornered match at 50 targets per man for $25 a corner. Under the conditions Hooper stood at scratch, while Eggler and Atchley had respectively 5 and 10 extra targets to shoot at. Atchley won the race by 1 break, scoring 44 out of 60 to Hooper's 43 out of 50. Scores:

P Atchley (10).1111110011011011110001111001111111101110110—37

11111 — 5—40

NEW UTRECHT GUN CLUB.

Nov. 7.—The target grounds of the New Utrecht Gun Club, of Brooklyn, at Dyker Meadow, were practically deserted this afternoon, notwithstanding the fact that it was the day for the club shoot and the contest for the Hegeman badge. Dr. Pool, a Class B man, was high in the club shoot with 20 out of 25 targets, known traps and angles. In the Hegeman badge contest, also known traps and angles, A. E. Purdy, of Class C, with 2 extra targets to shoot at, landed an easy winner. This victory for Purdy really gives the badge to Mr. Adams, who has won the badge so often that his nearest competitor, Donly Deacon, cannot equal his record were he to win all the contests for that trophy that yet remain to be shot. Scores:

	Club Shoot	Hegeman Badge.
Platt Adams (A)..0111110110111010011111111—19		111100111010110 —10
Dr. Littlefield (A).1001111001011111111101101—18		1110010000011010 — 7
Dr. G. E Pool (B).1101101001111111111101101—20		0110010100111000 — 7
A E Purdy (C)...1101100000101011011101001—13		001101111011011111—12

Sweeps were shot as below:

No. 1, 10 targets, unknown angles—Dr. Pool, 9; Dr. Purdy, 6; Platt Adams, 5; Dr. Littlefield, 5; John Hardy, 2.

No. 2, same—Dr. Purdy, 7; Platt Adams, 6; Dr. Pool, 6; Dr. Littlefield, 6; John Hardy, 6.

No. 3, same—Platt Adams, 6; Dr. Littlefield, 5; Dr. Pool, 5; John Hardy, 3.

At Audubon Park.

BUFFALO, N. Y., Oct. 29.—A live-bird shoot was held to-day at Audubon Park under the management of Mr. Garbe, its present proprietor. The day was remarkably fine and pleasant for the time of year, but the attendance was by no means up to the usual standard, only eight shooters taking part in the three events at live birds. The scores in these events were as below:

	No. 1:	No. 2:	No. 3:
Krotz	01112—4	12112—5	1022112—6
16-gauge	01102—3	11122—5	1011120—5
McArthur	112•—4	02112—4	1221212—7
Sandy	2•222—4	02212—4	1210210—5
Du Pont	22222—5	12010—3	2012021—5
Rossiter	101•0—2	.....	.....
Nitro	.....	12012—4	2010102—4
E W S	.....	.....	2120020—4

Two events at targets were also shot, each being at 10 targets, 75 cents entrance, two moneys. The scores were:

No. 1: Krotz 9, Du Pont, McArthur and Sandy 8, 16-gauge and Nitro 7, King 6.

No. 2: Du Pont 9, Krotz and McArthur 8, 16-gauge, Sandy and Nitro 7, King 6.

Kentucky Gun Club's Tournament.

LOUISVILLE, Ky., Oct. 24.—The Kentucky Gun Club, of Louisville, Ky., closed its annual autumn tournament to-day after three days of continuous shooting. The first day all events were at targets; second day, Kentucky Handicap and sweeps at pigeons; and third day, Kentucky State championship at pigeons.

On the opening day the weather was beautiful, but so awfully hard is the shooting made on these grounds that low scores generally prevailed. J. D. Gay carried off first average, Harry Lyons and Bland Ballard tied on second, while Cooper took third. Mr. Cooper's record is remarkable, as this gentleman had never before shot on these very difficult grounds, or rather at the swift, low, record-breaking targets which have puzzled so many of the best shots.

On the second day the weather was simply vile. It rained and drizzled all the time, and had the pigeons been anything but first-class the shooting must have been very tame, but so good were they that the dampness did not seem to interfere with them much, and out of 18 entries in the Kentucky Handicap only four were fortunate enough to go out straight, which captured all the money, this event being at high guns. On this day again did Mr. Gay show off to splendid advantage, scoring 57 out of 58 pigeons shot at, a feat any man may well be proud of.

To-day (Oct. 24) the weather was bright and clear, with a slight breeze blowing from left to right directly across the traps. When twenty-one men had made their entrance time was called, and the match for the championship of dear old Kentucky was on.

The most remarkable feature of this affair is that out of this number of entries seven should reach the 24 notch, showing clearly how well so many of the contestants were shooting.

Chadwick, who had the match fairly and snugly won by scoring his last bird, had the misfortune to undershoot a rising, drifting right-quarterer with his first barrel, and to do very little apparent damage with his second. He thus had the mortification of finding himself changed in one instant from the absolute possession of the cup to a mere competitor in a well-filled tie—a tie which was bound to be difficult to win owing to the skill of the men who composed it. This was all the more aggravating, as Chadwick had scored 24 last year and also had landed in for first place, so that in spite of his having killed and scored 48 pigeons out of 50, fate decreed that he should have nothing to show for it.

Lyons, with his never-let-go style, after losing his 2d bird made a run of 33 straight—quite a good many when one has to kill them one at a time. He can flatter himself that he was the last man to cling to Bland Ballard, who, after he once got into the tie, could not be shaken off. Ballard shot to-day at 45 pigeons, including 5 in a miss-and-out, and killed them all, but lost one dead out of bounds—his 20th bird. So one can readily see the form he was in, and no further comment would elucidate. He shot a dead game match and won it on his merits, and that is just what one may expect of him whenever called on to show his colors.

Clay and Woodstock had the misfortune to each lose a bird dead out of bounds. So, in such company, when a fellow wins out he may consider himself a very fortunate man, sure.

The shooting of Norvin Harris was excellent; 23 out of 25 is away up, and when one considers how little practice he gets at the traps, one marvels at his success.

But those modest men in their quiet way perform wonders at times, and the charming part of it all is that they always delight in praising the exploit of a friend, but are forever silent on their own achievements; and that is refreshing.

Shipp, who started in with a dead bird out of bounds, pulled himself well together and landed well in the money, making several beautiful kills; but luck will kill any one. Phipps had his share on that day.

Trimble shot splendidly all along, losing an awfully fast quartering to the right little blue hen that went out like a rocket, but did not come down like a stick. He duplicated his Chicago score of 24 out of 25, but on this occasion on vastly harder birds.

Jim, the purveyor, was in his glory, and a merry little twinkle danced in his blue eyes when some ambitious youngster came to grief on a specially hard twisting driver. And well he might, for he secured for this occasion a great lot of birds.

The Parker gun was strictly in evidence in the hands of Messrs. Gay, Lyons, Chadwick, Woodstock, Cooper, Page, Clay and many others; while Schultze, Du Pont, E. C. and Hazard powders were very generally used. Bland Ballard used V. L. & D., U. M. C., Schultze hand-loaded shells, and so did Woodstock. Gay shot U. M. C. Smokeless shells and Du Pont, while Lyons shot Smokeless shells and E. C.

First Day, Oct. 22.

A miss-and-out, $1 entrance, with 8 entries, was divided between Ballard and Chadwick, who scored 5 straight. GAUCHO.

Curious Decision of a Referee.

WE have often been asked to decide the following point that sometimes occurs in a live-bird match: A and B are shooting a match; it is B's turn to shoot. He goes to the score, calls "Pull" and kills his bird. A then discovers that when B called "Pull" only four of the five traps were loaded. What should be the referee's decision? We have invariably replied: It is a no bird; B must shoot at another bird from the *five unknown traps*. That is our interpretation of Rules 4 and 5, A. S. A. rules (revised 1893).

It was with some surprise, therefore, that we read the decision of a referee on this point in the following clipping from a sporting paper mailed to us by a correspondent, with the request that we pass upon it in our columns for the benefit of himself and others interested in such things.

"A singular happening took place during the shooting; it occurred just after Winston went out to gather a knocked down bird. Naturally, every one watched the retrieve closely. The trapping lads were as much interested as Winston himself. Thus it happened that No. 4 trap remained unfilled when Count went to the score and called 'Ready, pull!' He killed the bird nicely. Winston turned toward the referee and said:

"'Mr. Referee, should not Count shoot at another bird? The rules call for five traps.'

"The reply of the referee was: 'Yes, they do call for five traps, and technically you are right. As it is the referee's business to see that the traps are filled, I fail to see how I can penalize the shooter for the fault of that official.' The bird, having been killed, was scored a credit for Count."

As in all similar cases, so in this one, we say that it was a no bird, and that Count should have been made to shoot at another bird from *five unknown traps*. We think the error in judgment in the decision quoted above lies in putting the duties of a referee, specially referred to in the A. S. A. rules, above that duty which is not specifically mentioned, but which is just as surely his, viz: the interpretation of those rules. It is perfectly true that the rules say (Rule 2): "The referee shall see that the traps are properly set at the beginning of the match and kept in order to the finish, and that they are kept properly filled." It is also perfectly correct that the rule says nothing about the interpretation of the rules; but if the referee is not to interpret them, who is?

Rule 4 says: "'* * * All traps must be filled before the shooter calls 'Pull.'" As we look upon that rule, it is just as incumbent on the shooter at the score to see that the traps are properly filled as it is the duty of the referee. Arguing on that line, we would say that had Count lost that bird he would have had to abide by the result of the shot; the principle is on all fours with the Hurlingham rule (No. 22): "Should any member kill a bird at a distance nearer than that at which he is handicapped, it shall be scored no bird, but should he miss, a lost bird." The advantage to a shooter in having to cover only *four* loaded traps as against five, especially if the empty trap is an outside one, is surely as great as shooting from a mark closer to the traps than his original distance.

In the Winston-Count case, above quoted, the referee does not seem to have realized that he was actually penalizing Winston by giving a decision favorable to Count. Quoting the referee's own words: "As it is the referee's business to see that the traps are filled, I fail to see how I can penalize the shooter for the fault of that official." As we look at it, the shooter was just as much to blame as the referee, under Rule 4, A. S. A., and he should have been penalized for his own *fault*.

Take it another way: Suppose the referee's decision in the Winston-Count case was allowed to stand as a precedent, it would be possible for a shooter by collusion with a trapper to get only four unknown traps some time or another, just when he needed a bird badly perhaps. With all due deference to the referee, who is a gentleman of considerable experience in the character of a referee, we must state that in our opinion his view of the matter was erroneous, his reasoning fallacious and his decision bad law.

In Western Pennsylvania.

EAST PITTSBURG GUN CLUB.

PITTSBURG, Pa., Oct. 27.—The East Pittsburg Gun Club held a shoot to-day, 13 events at targets being decided. Among the 14 shooters present were some good shots, Mack, Sharrard, Athos, Gelm and Oliver doing good work, while to Old Hoss belonged the honor of being the only man able to make a straight score of 15 breaks; this he did in event No. 9. The scores are given below:

Events:	1	2	3	4	5	6	7	8	9	10	11	12	13
Targets:	10	15	10	10	10	10	10	10	15	10	15	15	15

SHOOTERS AT LIGONIER.

LIGONIER, Pa., Oct. 29.—The brothers Denny, Jim and Frank, entertained as their guests some eight shooters who were anxious to try their guns on Ligonier live birds. The shoot was a sporting one and some good scores were made. W. S. King and Jacque tied for first honors in the four events tabulated below, each man losing 3 out of 39 shot at; Alex. King scored 34 out of the same number. Nos. 1 and 4 were $5 entrance; No. 2, $15, and No. 3, $10 entrance. The scores made in all the sweeps were:

Events:	1	2	3	4	Events:	1	2	3	4
Birds:	7	15	10	7	Birds:	7	15	10	7
W S King	7	13	9	7	Jacque	6	14	9	7
F H Denny	7	4	9	7	J O'H Denny	5	8	8	6
McPherson	6	11	10	w	Stahl	2	..	..	..
A H King	6	14	7	7	Witherow	..	..	..	5
T Laughery	6	..	..	7	Reno	..	..	..	2

Two miss-and-outs, $2 entrance in each event, were also shot. The first, with 7 entries, was divided between J. O'H. Denny and A. H. King. The second, with the same number of entries, was won by Laughery.

Haverhill Gun Club.

HAVERHILL, Mass., Oct. 31.—To-day was the last of the regular practice shoots of the Haverhill Gun Club. The day was perfection for trap-shooting, but only seven members of the club faced the traps. Below is a record of the scores made:

Events:	1	2	3	4	5	6	7	8	9	10
Targets:	10	10	10	10	10	10	10	10	10	10
Lambert	5	2	8	2	2	4	7	3	6	5
George	7	7	7	5	5	6	7	8	7	9
Dr Sherman	5	2	3	..	4	7	2	4	2	2
Miller	5	7	7	5	7	3	7	4	5	2
Webster	..	7	4	7	3	7	7	2	7	4
Holden	7	3	3	5	..	..	..	3	8	4
Stevens	6	..	..	7	10	3	8	..	..	..

Nos. 1, 4, 5, 8 and 9 were at known angles; Nos. 2, 3, 6 and 7 at unknown angles; No. 10 was at reversed order, with traps 2, 3 and 4 set at unknown angles. GEORGE F. STEVENS, Sec'y

Calumet Heights Gun Club.

CHICAGO, Ill., Oct. 31.—I herewith hand you scores of target contests held to-day on the grounds of Calumet Heights Gun Club. These events, together with our rifle contest, which show under the head of rifle shooting, were participated in by the club's members and friends. There were present some 64 persons. Halloween, after supper, all adjourned to the spacious cottage of the genial Mr. Spalding, which was illuminated by pumpkin faces of varied expression and otherwise decorated. The assembly were entertained with recitations by Miss Scribner, Dr. Shaw, Miss Knowles and others. Ducking for apples, and other games usual to Halloween, were indulged in to the hour of midnight. The evening's enjoyment ended with a lunch of chicken salad, coffee, etc. The day was considered one of the most enjoyable of the year, the weather being perfect.

Thanksgiving Day, which ends the shooting season of the club, a programme of similar nature will be arranged for, when live birds, targets and rifle shooting for prizes will take place, also the regular annual turkey shoot for both ladies and gentlemen.

The scores in the trophy contest follow. Lamphere won the class A medal, Houston the class B medal and Boedke the class C medal:

Class A.

Paterson	11101011111011111111111111—22

PATTY.

PUBLISHERS' DEPARTMENT.

Growth of the Tourist System.

THE Pennsylvania Railroad Company, through its personally conducted tourist system and the unexcelled standard of high service, has won an enviable record for itself. These tours have grown to be thoroughly appreciated in this age of luxurious travel, and the series announced for the season of '96 and '97 admirably illustrates the progress of the times.

First comes a series to the Golden Gate, starting from New York, Philadelphia and Harrisburg, Jan. 27, Feb. 24 and March 27. Tourists will travel by superbly appointed special trains of Pullman compartment, drawing-room sleeping, dining, smoking and observation cars, under the supervision of a Tourist Agent and Chaperon.

Next in importance comes a series of four to Florida—Jan. 26, Feb. 9 and 23, and March 9. The first three admit of two weeks in the sunny South, while tickets for the fourth tour are good to return by regular trains until May 31.

A series of short tours to Washington from New York, Philadelphia and adjacent points will be run on Dec. 29, 1896; Jan. 21, Feb. 11, March 11, April 1 and 22, and May 13, 1897.

Old Point Comfort, Richmond and Washington tours will leave New York and Philadelphia Dec. 26, 1896, Jan. 23, Feb. 20, March 18, and April 15, 1897.

Handsome illustrated itineraries will be issued by the Pennsylvania Railroad Company, containing full information as to how these tours may be pleasantly and profitably made. These itineraries may be procured on personal application or by addressing Tourist Agent, 1196 Broadway, New York; 860 Fulton street, Brooklyn; 789 Broad street, Newark, N. J., or Room 411, Broad street Station, Philadelphia. —*Adv.*

Water Tube Boilers.

THE Roberts Safety Water Tube Boiler Co. was incorporated Nov. 1, 1890. It has built nearly 900 boilers, ranging from those suitable for small launches up to installations of nearly 2,000 horse power in one vessel. The capital stock of this company is $250,000, and the sixth consecutive annual dividend of 10 per cent. was declared on the first day of this month by the Board of Directors, notwithstanding the fact that the last three years have been years of unusual business depression. It is claimed that the works of this company are larger than any other plant in the United States devoted exclusively to the construction of marine water tube boilers. The tools are of the most modern type, nearly $30,000 having been expended in adding to same during the past year. Although the Roberts Co. are the owners of a number of patents on water tube boilers, they have found that, all things being taken into consideration, the original type gives the best satisfaction, with some slight improvements in construction and material.—*Adv.*

Hunting the Wild Goat.

THE white goat, or Rocky Mountain goat, as it is indiscriminately called, is a species of big game rarely hunted by sportsmen. This is not so much because of the difficulty of killing the animal, nor because of its actual rarity. It is a stupid animal, easily shot when once found. It is not, however, shot in the usual hunting grounds, as are bears, deer, elk, etc. It is remote from the common localities, but where found is in goodly numbers. It ranges very high up in the mountains—above the timber line usually—among the rocks and cliffs. This requires great labor to get to it, but once there the hunter will get his game nine times out of ten.

If you care to read of a goat hunt made in the Bitter Root Range in Montana, in the fall of 1895, send 6 cents to Chas. S. Fee, General Passenger Agent, Northern Pacific R'y, St. Paul, Minn., for "Wonderland '96," which recounts such a hunting expedition.—*Adv.*

Sold Out.

CHAS. GILCHRIST, of Port Hope, Can., orders his advertisement canceled, and adds:

"I have sold nearly all my rice. I sold between six and seven thousand pounds. I have about fifteen hundred pounds left, and expect an order for that to-morrow. A great many of the orders said they saw my ad. in your valuable paper."—*Adv.*

Arms and Sporting Goods.

THE catalogue of the John P. Lovell Arms Company, of Boston, contains 180 large pages of practical information relating to sporting goods. A discount sheet which is published along with it gives net rates on a number of different lines. This catalogue will be sent free of charge to any one mentioning FOREST AND STREAM.—*Adv.*

Finds It Pays.

ST. LOUIS, Mo., Nov. 5.—*Forest and Stream Pub. Co:* Replying to your favor of the 1st inst., please continue my advertisement for one more year.

I have received a great many replies to my adv., which has appeared in your paper in the past year, and am well satisfied with the results in that respect.—FRED MEDART, Fine Boats and Launches. —*Adv.*

FOREST AND STREAM.

A WEEKLY JOURNAL OF THE ROD AND GUN.

TERMS, $4 A YEAR. 10 CTS. A COPY. SIX MONTHS, $2.

NEW YORK, SATURDAY, NOVEMBER 21, 1896.

VOL. XLVII.—No. 21 No. 346 BROADWAY, NEW YORK.

For Prospectus and Advertising Rates see Page iii.

Forest and Stream Water Colors

We have prepared as premiums a series of four artistic and beautiful reproductions of original water colors, painted expressly for the FOREST AND STREAM. The subjects are outdoor scenes:

Jacksnipe Coming In. "He's Got Them" (Quail Shooting). Vigilant and Valkyrie. Bass Fishing at Block Island.

The plates are for frames 14 x 19 in. They are done in twelve colors, and are rich in effect. They are furnished to old or new subscribers on the following terms:

Forest and Stream *one year and the set of four pictures*, **$5.**
Forest and Stream *6 months and any two of the pictures*, **$3.**
Price of the pictures alone, $1.50 each; $5 for the set.

Remit by express money order or postal money order. Make orders payable to

FOREST AND STREAM PUB. CO., New York.

FOREST AND STREAM OFFICE

346 Broadway

NEW YORK LIFE BUILDING

Present Entrance on Leonard Street

The FOREST AND STREAM is put to press on Tuesdays Correspondence intended for publication should reach us by Mondays and as much earlier as may be practicable.

AUDUBON BIRD PLATES.

The reproductions are to me most satisfactory; they lack color, of course, but in every other respect are the best we have ever seen, and I think I may say that those of the Audubon family still remaining are much gratified with the first of the series. M. R. AUDUBON.

THE first subject of the FOREST AND STREAM series of half-tone copies of Audubon's famous bird portraits was that of the Black Duck, in the issue of Sept. 26; the second, of the Prairie Chicken (pinnated grouse), was given Oct 24. To-day we print the Canvasback. Others which will follow on dates to be announced are:

SHOVELLER DUCK.
REDHEAD DUCK.
AMERICAN WHITE-FRONTED GOOSE.
PURPLE SANDPIPER.
AMERICAN GOLDEN PLOVER.
WILLOW PTARMIGAN.

In connection with the plate we give Audubon's account of the bird, which was famous in his day, as it is in ours, for its excellence on the table. The chapter is from the fourth volume of the Ornithological Biography, published in 1838. We have not the date of the Cabinet of Natural History from which the description by Dr. Sharpless is taken; but the "some years ago" would give it a place among the early years of the century. One of the most common, as it is the most impressive, reflections which we indulge in when reading of men and events and human ways in the distant past, is the likeness of the human nature of those days to the human nature as we know it and manifest it in our own day and in our own selves. The material conditions of canvasback shooting then prevailing were not dissimilar from those which exist to-day, barring perhaps the richer abundance of the game and the ruder implements of its pursuers. Then, as now, Carroll's Island, Maxwell's Point and other peculiarly favored shooting grounds were held at high figures; and there were in vogue all the methods of taking the game now practiced, openly or under a ban, including big guns, night-shooting and netting. The human nature of the men who went out for ducks, whether for sport or for market, sitting-shooting or flying-shooting, in the early thirties was much of a piece with that of the sportsman and market-shooter of our times. There is a similarity even between the ducking dogs of that day and of this, tolers and retrievers.

The men who went duck shooting in those times were after ducks; and the man of sixty years later may thank his stars that they did not then have breech-loading magazine guns and factory-loaded cartridges. The canvasback shooter of the nineties should have more than antiquarian interest in the powder horn, shot bag and ramrod of the thirties; he may well regard them with a lively sense of gratitude for the slowness of reloading they compelled even in the coolest hands, the fumbling of excited fingers, the not infrequent pouring in of the shot before the powder, and at best and always the opportunity they gave the game to get out of range. To the sportsman of old the muzzle-loader was a source of huge satisfaction, despite its qualities of tardiness and mischance; in its possession of these very characteristics is found our chief admiration of the ancient trusty.

SUNDAY SHOOTING LAWS.

THE Sunday shooter is much in evidence this year. We have chronicled numerous instances of his discomfiture at the hands of vigilant and vigorous game wardens. He has fared particularly hard in the jails and lock-ups of New Jersey, and we have reported his undoing in many other States where the laws forbid gunning on Sunday.

There are two view points from which to regard such statutes: one is the moral and religious, the other the purely economic one of game protection. To keep the two considerations distinct is not always more successfully accomplished than in a recent Sabbath observance question which arose in St. Augustine, Fla., in connection with a projected Sunday excursion to that city of the Jacksonville Rifles. A St. Augustine clergyman having publicly protested against their coming on that day, the militia desisted, and the published announcement explained the double-barreled reason for their decision in these words:

From a moral point of view the Jacksonville Light Infantry decided not to go on the excursion. Another reason was that the company's football team usually has a practice game on that day, and the excursion would seriously interfere with the practice.

With the moral point of view a sportsman's journal has properly no concern; the economic reasons may be discussed freely. Six days of the week, in settled precincts, allow as much pursuit as the game supply should be subjected to during the open season; and it ought to have given to it the benefit of one day a week of freedom from alarm. As for the close season, in many districts the Sunday shooter is the game law violator most defiant, most reckless of the farmer's rights, ruffianly, and most difficult to cope with.

In the interest of better game protection, should not Sunday shooting be forbidden, and the prohibition of it made effective by a statute providing that possession of firearms in the field on Sunday should constitute *prima facie* evidence of a violation of the law?

FROG FARM PHILANTHROPY.

THE latest frog farm story comes from New Jersey. A schoolmistress fallen into ill health, and obliged to give up her school, found herself without means of support. Friends rallied to her assistance, contributed funds sufficient to buy a piece of land and set her up in business as a frog farmer, which lucrative pursuit she is now following, with much satisfaction to the New York *bon vivants* and profit to herself.

It is a story not unpleasing; there is in it only one doubtful element, and this has not to do with the humanity involved. Schoolmistresses do fall ill; the world is full of sweetness and light and ready willingness to assist the unfortunate, and purse strings loosen at the call of distress. But who ever heard before of a frog farm as a philanthropic enterprise? For that matter, who ever heard of a frog farm at all outside of the newspapers? Do the Stars and Stripes float over a single frog farm in all of Uncle Sam's domains?

We have investigated many of these stories of men and women who were farming frogs on a large scale, but we have never yet got within hearing of their melodious live stock. We believe that the only frog farms in existence are those laid out, stocked and attended by Dame Nature. If any person has information of the artificial culture of frogs anywhere on this continent, he will kindly advise us of the particulars in behoof and for the benefit of inquiring correspondents, who, about one in six months, request to be told how to go to work to make a fortune by frog farming.

THE GROWTH OF A SENTIMENT.

WE have heard it hinted that, undismayed by the recent tremendous vote in condemnation of the proposed amendment of the Forest Preserve section of the New York Constitution, the plotters against the Adirondack wild lands intend to continue their agitation of the question and their efforts to break down the constitutional safeguards of the forests. We advise these misguided brethren to possess their souls in patience and resignation to the popular decree. If there was not a living chance of carrying through their schemes in 1896, there will be no living chance in this generation. They may agitate and scheme and contrive until they are white haired and palsied with age, but the forestry section will stand as it is.

This emphatic repelling of Adirondack invasion illustrates a distinct period of our civilization in its attitude toward the forests. We have come at length to a point where we can see something better in the woods than mere raw material incontinently to be hewn down and converted into firewood, tan bark, lumber, charcoal and the all-compelling wood pulp. We have passed beyond the stage when woodlands were to be cleared for the sake of clearing and just because they were woodlands; and now we have come to regard the forest as something to be protected and preserved and guarded and cherished because it is forest, and because we have a more rational recognition of the place of wild forest tracts in the great scheme of union and interdependence which holds between man and nature. Having destroyed in our folly, we now in our reason stay the hand of destruction; having wrecked without ruth, we now are concerned to save what we may from the wreckage. The people of the State have declared and do declare and will declare, "We shall keep the forests because they are forests, for our enjoyment of them as forests, and for their enjoyment by our children and children's children." This was the spirit which animated tens of thousands of voters the other day who have never seen the Adirondacks nor expect ever to see them. The vote was a vote of sentiment, a sentiment which is gaining every year, which will be stronger next year than now, and the year after than then; and which is not to be overcome by specious schemes of lumbermen and permanent camp-site grabbers.

DEATH OF JAMES BOYD NIXON.

ANOTHER one of the FOREST AND STREAM's circle of contributors has passed over to the majority. James Boyd Nixon, of Bridgeton, N. J., who was a frequent correspondent over the signature F. S. J. C., died on Thursday of last week, at the age of forty-nine. Mr. Nixon had spent a number of winters in the South, whence he wrote vivacious and well-received sketches of Florida tarpon fishing and the other outdoor pursuits in which he took part for their health-giving influences. It was the privilege of members of the FOREST AND STREAM staff to have met Mr. Nixon personally, and by such intercourse to have shared the esteem for him which was entertained by his fellows. "No man in this part of the State," says the Bridgeton *News*, "was more universally liked or more popular among an unusually wide circle of acquaintances. He was actively interested in all branches of sport, and was an acknowledged authority on many, especially that of angling. He was a desultory, but always acceptable, contributor to various papers and magazines, and had his inclination turned him into distinctively literary paths his success would have been notable. In him our city has lost a capable lawyer, an honorable citizen and a cultured gentleman."

REPEAL SECTION 249.

THE next convention of the New York State Association for the Protection of Fish and Game will be held in Syracuse on Jan. 13, when proposed amendments of the game laws will be considered.

The most important subject to be discussed will be the repeal of Section 249, the iniquitous provision which permits the sale of game the year around, and is working the injury of the game interests of New York and of every State tributary to its market. The Association can accomplish no greater public service than the modification of this law. Repeal Section 249.

STORIES OF THE HEROIC AGE.

UNDER this title we shall begin next week the publication of a series of chapters out of the lives of certain men on the Western frontier. The incidents are worth the telling, and we promise that they shall be worth the reading.

AUDUBON'S PORTRAIT OF THE CANVASBACK DUCK.

Natural History.

THE CANVASBACK DUCK.*

(*Fuligula valisneriana*, STEPHENS.)

THE range of the celebrated duck with the history of which I commence the fourth volume of my Biographs may be considered as limited on the one hand by the mouths of the Mississippi and on the other by the Hudson or North River. Beyond the latter it is rarely seen at any season on our Eastern coasts; and this circumstance, conjoined with its being now and then observed on the upper waters of our Western districts, and its breeding in great numbers on the borders of Bear River, which flows into the salt lake of Timpanajoz in upper California, as well as in the marshes and along the banks of streams in many parts of the Rocky Mountains, induces me to believe that the individuals of this species, instead of proceeding along the shores, pass overland toward their breeding grounds, however far northward they may be situated. According to Dr. Richardson, it breeds in all parts of the fur countries, from the 50th parallel to their most northern limits.

While in our Atlantic districts, it is found in much greater numbers on the Chesapeake and the streams that flow into it than anywhere else. Indeed, it is not more than twenty years since its regular appearance and sojourn on the waters of the Southern States has been observed or at least acknowledged. Although at New Orleans, where it goes by the name of *Canard cheval*, it has been known to the oldest duck shooters now alive, from their earliest recollection, it is not more than about fifteen years since it began to rise from a very low price to $2 the pair, at which price it sold during my visit in March, 1837.

This enhancement of its value I look upon as having arisen from the preference given to it by the epicures of our Middle districts, who have strangely lauded it as superior to every other duck in the world. This alleged pre-eminence has indeed become so deeply impressed on the minds of many of our Southerners that they have on various occasions procured the transportation of numbers of canvasbacks from Baltimore to Charleston in South Carolina, and even to Savannah in Georgia, although this species is by no means uncommon within a few miles of the latter city, as well as on the Great Santee River. I well remember that on my pointing out to a friend, now alas dead, several dozens of these birds in the market of Savannah he would scarcely believe that I was not mistaken, and assured me that they were looked upon as being poor, dry and very fishy, in short, not half so good as mallards or blue-winged teals. With this I cordially agreed, for there, at that season, they are not better than represented.

I found this species in considerable numbers on and about the numerous inlets and rivers of east Florida; but did not see a single individual on the Gulf of St. Lawrence, along the coast of Labrador, or on that of Newfoundland.

It arrives in the neighborhood of New Orleans from Oct. 20 to the end of December, coming in flocks of eight or twelve, probably the members of a single family, and, unlike many other species, keeping in small groups during winter. At the approach of spring, however, they flock together, and about the first of April depart in large bodies. During their stay they are wont to alight in wet prairies and muddy ponds in all open places, feeding on the seeds of various plants, of which may be particularized the wild oat and the water lily.

According to Alexander Wilson, who first described this species, their arrival in autumn in the Middle districts takes place about Oct. 15; but more recent writers say that, "unless the weather of the North has been severe, the canvasback rarely appears till the middle of November." With this I fully agree, being convinced that their journeys to and from their breeding places are performed across the country. Were this perfectly ascertained, it would prove that this species, unlike most other ducks, instead of removing further southward in autumn and winter, takes what may be called a lateral march toward our Eastern districts, in which it remains until the weather has become too cold for its constitution, when it is forced a second time to migrate and betake itself to warmer parts of the country, where it continues during the rest of the winter.

The flight of this species, although resembling that of our larger sea ducks in having the appearance of being rather labored, is strong, rapid, at times very elevated, and well sustained. It swims deeply, especially when under apprehension of danger, and this probably the better to enable it to escape by diving, at which it is almost as expert as our sea or diving ducks. But, although its speed on the water is considerable, it moves rather heavily on land. Its food varies according to the season and locality. The plant called *Valisneria*, on which it is said to feed when on the headwaters of the Chesapeake, is not found equally abundant in other parts, and even there is at times so reduced in quantity that this duck and several other species which are equally fond of it are obliged to have recourse to fishes, tadpoles, water lizards, leeches, snails and mollusca, as well as such seeds as they can meet with—all which have been in greater or less quantity found in their stomachs.

Nothing is known of its manners during the breeding season; and we are equally ignorant of the changes of plumage which, like other species, it may undergo at that period.

As I have not had very good opportunities of making myself acquainted with the modes in which the canvasbacks are obtained for the markets, I here present an account of duck shooting on the waters of the Chesapeake, published some years ago in the "Cabinet of Natural History," and of which a copy has been transmitted to me by its author, Dr. J. J. Sharpless, of Philadelphia, to whom, for this and other marks of attention, I offer my best thanks:

"The Chesapeake Bay, with its tributary streams, has from its discovery been known as the greatest resort of water fowl in the United States. This has depended on the profusion of their food, which is accessible on the immense flats or shoals that are found near the mouth of the Susquehanna, along the entire length of Northeast and Elk rivers, and on the shores of the bay and connecting streams as far south as York and James rivers.

"The quantity of fowl of late years has been decidedly less than in times gone by, and I have met with persons who have assured me that the number has decreased one-half in the last fifteen years. This change has arisen, most probably, from the vast increase in their destruction, from the greater number of persons who now make a business or pleasure of this sport, as well as the constant disturbance they meet with on many of their feeding grounds, which induces them to distribute themselves more widely and forsake their usual haunts.

"As early as the first and second weeks in October the smaller ducks, as the buffelhead (*Anas albeola*), south-southerly (*A. glacialis*), and the ruddy or heavy-tailed duck (*A. rubidus*) begin to show themselves in the upper part of the bay; and by the last of the month the blackhead (*A. marila*), widgeon or bald pate (*A. americana*), redhead (*A. ferina*), and the goose (*A. canadensis*) appear, and rapidly distribute themselves down the bay. The canvasback (*A. valisneria*) and the swan (*Cygnus americanus*) rarely, unless the weather to the north has been severe, appear in quantities till the middle of November. All these fowl when first arrived are thin and tasteless, from their privation during their migration and perhaps preparatory arrangements, and require some days at least of undisturbed repose to give them the peculiar flavor for which some of them are so celebrated. During the low tides succeeding their arrival the birds sit on the flats far from the shores, and rarely rise to the wing unless disturbed; but when the spring tides render the water too deep for feeding they commence their career, and pass down the bay in the morning and return in the evening. Most of these fowl feed on the same grass, which grows abundantly on the shallows in the bay and adjacent waters, and has been called duck grass (*Valisneria americana*). It grows from 6 to 18in. in length, and is readily pulled up by the root. Persons who have closely observed these ducks while feeding say that the canvasback and blackhead dive and pull the grass from the ground and feed on the roots, and that the redhead and bald pate then consume the leaves. Indeed, although the bald pate is a much smaller bird than the canvasback, it has been seen to rob the latter, immediately on its return from under the water, of all its spoil.

"All these larger ducks are found together when feeding, but separate when on the wing. That they feed on the same grass is evident from the similarity of flavor, and those most accustomed to the article have a difficulty in deciding on the kind of duck from the taste. Indeed, the bald pate is generally preferred by residents.

"By the middle of December, particularly if the weather has been a little severe, the fowl of every kind have become so fat that I have seen canvasbacks burst open in the breast in falling on the water; and, spending less time in feeding, they pass up and down the bay from river to river in their morning and evening flights, giving at certain localities great opportunities for destruction. They pursue even in their short passages very much the order of their migratory movements, flying in a line or baseless triangle; and when the wind blows on the points which may lie on their course the sportsman has great chances of success. These points or courses of the ducks are materially affected by the winds, for they avoid, if possible, an approach to the shore; but when a strong breeze sets them on these projections of the land they are compelled to pass within shot, and often over the land itself.

"In the Susquehanna and Elk rivers there are few of these points for shooting, and there success depends on approaching them while on their feeding grounds. After leaving the eastern point at the mouth of the Susquehanna and Turkey Point, the western side of the Elk River, which are both moderately good for flying shooting, the first place of much celebrity is the Narrows, between Spesutic Island and the western shore. These Narrows are about three miles in length, and from 300 to 500yds. in breadth. By the middle of November the canvasbacks in particular begin to feed in this passage, and the entrance and outlet, as well as many intermediate spots, become very successful stations. A few miles further down the western shore is Taylor's Island, which is situated at the mouth of the Rumney, and Abbey Island at the mouth of Bush River, which are both celebrated for ducks, as well as swans and geese. These are the most northerly points where large fowl are met with, and projecting out between deep coves, where immense numbers of these birds feed, they possess great advantages. The south point of Bush River, or Legoe's Point, and Robbin's and Rickett's points, near Gunpowder River, are fruitful localities. Immediately at the mouth of this river is situated Carroll's Island, which has long been known as a great shooting ground, and is in the rentage of a company at a high rate. Maxwell's Point, as well as some others up this and other rivers, and even further down the bay, are good places, but less celebrated than those I have mentioned. Most of these points are let out as shooting grounds to companies and individuals, and they are esteemed so valuable that intruders are severely treated.

"It has been ascertained that disturbing the fowl on the feeding flats is followed in most cases by their forsaking these haunts and seeking others; hence, in the rivers leading to the bay near flying points, they are never annoyed by boat shooting, either by night or day, and although the discharge of guns from the shore may arouse them for a time, they soon return; whereas a boat or sail in chase a few times will make them forsake a favorite spot for days.

"From the great number of ducks that are seen in all directions one would suppose that there could be no doubt of success at any one of the points in the course of flight; but while they have such correct vision as to distance and wide range of space, unless attending circumstances are favorable a sportsman may be days without a promising shot. From the western side of the bay—and it is there the best grounds are found—the southerly winds are the most favorable; and if a high tide is attended by a smart frost and mild south wind, or even calm morning, the number of birds set in motion is inconceivable, and they approach the points so closely that even a moderately good shot can procure from fifty to 100 ducks a day. This has often occurred, and I have seen eight fat canvasbacks killed at one discharge into a flock from a small gun.

"To a stranger visiting these waters the innumerable ducks, feeding in beds of thousands, or filling the air with their careering, with the great numbers of beautiful white swans resting near the shores, like banks of driven snow, might induce him to suppose that the facilities for their destruction were equal to their profusion, and that with so large an object in view a sportsman could scarcely miss his aim. But when he considers the great thickness of their covering, the velocity of their flight, the rapidity and duration of their diving, and the great influence that circumstances of wind and weather have on the chances of success, it becomes a matter of wonder how so many are destroyed.

"The usual mode of taking these birds has been, till recently, by shooting them from the points during their flight, or from the land or boats, on their feeding grounds, or by toling, as it is strangely termed, an operation by which the ducks are sometimes induced to approach within a few feet of the shore, from a distance often of several hundred yards. A spot is usually selected where the birds have not been much disturbed, and where they feed at 300 or 400yds. from and can approach to within 40 or 50yds. of the shore, as they will never come nearer than they can swim freely. The higher the tides and the calmer the day the better, for they feed closer to the shores and see more distinctly. Most persons on these waters have a race of small white or liver-colored dogs, which they familiarly call the toler breed, but which appear to be the ordinary poodle. These dogs are extremely playful, and are taught to run up and down the shore in sight of the ducks, either by the motion of the hand or by throwing chips from side to side. They soon become perfectly acquainted with their business, and as they discover the ducks approaching them make their jumps less high till they almost crawl on the ground to prevent the birds discovering what the object of their curiosty may be. This disposition to examine rarities has been taken advantage of by using a red or black handkerchief by day and a white one by night in toling, or even by gently plashing the water on the shore. The nearest ducks soon notice the strange appearance, raise their heads, gaze intently for a moment, and then push for the shore, followed by the rest. On many occasions I have seen thousands of them swimming in a solid mass direct to the object; and by removing the dog further into the grass they have been brought within 15ft. of the bank. When they have approached to about 30 or 40yds. their curiosity is generally satisfied, and after swimming up and down for a few seconds they retrograde to their former station. The moment to shoot is while they present their sides, and forty or fifty ducks have often been killed by a small gun. The blackheads toll the most readily, then the redheads, next the canvasbacks, and the bald pates rarely. This also is the ratio of their approach to the points in flying, although if the canvasback has determined on his direction few circumstances will change his course. The total absence of cover or precaution against exposure to sight, or even a large fire, will not turn these birds aside on such occasions. In flying shooting the bald pates are a great nuisance, for they are so shy that they not only avoid the points themselves, but by their whistling and confusion of flight at such times alarm others.

"Simple as it may appear to shoot with success into a solid mass of ducks sitting on the water at 40 or 50yds. distance, yet when you recollect that you are placed nearly level with the surface, the object opposed to you, even though composed of hundreds of individuals, may be in appearance but a few feet in width. To give, therefore, the best promise of success, old duckers recommend that the nearest duck should be in perfect relief above the sight, whatever the size of the column, to avoid the common result of over-shooting. The correctness of this principle I saw illustrated in an instance in which I had toled to within a space of from 40 to 70yds. off the shore a bed of certainly hundreds of ducks. Twenty yards beyond the outside birds of the dense mass were five blackheads, one of which was alone killed out of the whole number by a deliberate aim into the middle of the large flock from a rest by a heavy well-proved duck gun.

"Before I leave the subject of sitting shooting I will mention an occurrence that took place in Bush River a few years since. A man whose house was situated near the bank on rising early one morning observed that the river had frozen except an open space of 10 or 12ft. in diameter, about 80yds. from the shore, nearly opposite his house. The spot was full of ducks, and with a heavy gun he fired into it. Many were killed, and those that flew soon returned and were again and again shot at, till, fearful that he was injuring those already his own, he ceased the massacre and brought on shore ninety-two ducks, most of which were canvasbacks.

"To prevent the dogs, while toling, from running in, they are not allowed to go into the water to bring out the ducks; but another breed of large dogs of the Newfoundland and water spaniel mixture are employed. These animals, while toling is in progression, or at a point, take apparently as much interest in success as the sportsman himself. During a flight their eyes are incessantly occupied in watching the direction from whence the birds come; and I have frequently seen them indicate by their manner the approach of a flock so distant that the human eye would have overlooked it. As the ducks come on the dog lies down, but still closely observing them, and the moment the discharge occurs jumps up to see the effect. If a duck falls dead they plunge to bring it, but many of them wait to see how he falls and whither he swims, and they seem to be as aware as the gunner of the improbability of capture and will not make the attempt, knowing from experience that a bird merely winged will generally save himself by swimming and diving. These dogs usually bring one duck at a time out of the water; but a real Newfoundland, who was with me and my company this autumn, was seen on several occasions to swim 20yds. further, and take a second in the mouth to carry on shore. The indefatigability and ambition of these animals are remarkable, and a gentleman informed me he had known his dog bring in the space of one hour twenty canvasbacks and three swans from the water when the weather was so severe that the animal was covered with icicles, and to prevent his freezing he took his great coat to envelop him. Some dogs will dive a considerable distance after a duck, but a crippled canvasback or blackhead will swim so far under the water that they can rarely be caught by the dog, and it often has been observed that the moment one of these ducks, if merely winged, reaches the surface he passes under, and however calm cannot be seen again. To give an idea of the extreme rapidity with which a duck can dive I will relate an occurrence which was noticed by myself, and a similar one was noticed by another of the party the same

* From "Audubon's Ornithological Biography," published in 1838.

day. A male south-southerly was shot at in the water by a percussion gun, and after escaping the shot by diving commenced his flight. When about 40yds. from the boat he had acquired an elevation of a foot or more from the surface. A second percussion gun was discharged and he dived from the wing at the flash, and though the spot of entrance was covered by the shot soon rose unharmed and flew.

"Canvasbacks, when wounded on the streams near the bay, instantly direct their course for it, and there nestle among the grass on the shores till cured or destroyed by eagles, hawks, gulls, foxes, or other vermin, that are constantly on the search. If a dead canvasback be not soon secured it becomes a prey to the gulls, which rarely touch any other kind. I have seen severe contests take place between crippled canvasbacks and gulls; and although a pounce or two generally prevents further resistance, sometimes they are driven off. If the bird is remarkably savory the gull makes such a noise that others are soon collected, when possession is determined by courage or strength.

"Another mode of taking ducks consists in placing gilling nets under water on the feeding grounds, and when they dive for food their head and wings become entangled in the meshes and they are drowned. This plan, though successful at first, soon drives the bird from these places, and in some cases a few applications have entirely prevented their return for some weeks. Paddling upon them in the night or day produces the same effect, and although practiced to some extent on Bush River is highly disapproved of by persons shooting from points. For the last three years a man has been occupied on this stream with a gun of great size, fixed on a swivel in a boat, and the destruction of game on their feeding flats has been immense; but so unpopular is the plan that many schemes have been privately proposed of destroying his boat and gun, and he has been fired at with balls so often that his expeditions are at present confined to the night. Sailing with a stiff breeze upon the geese and swans, or throwing rifle balls from the shore into their beds, is sometimes successful.

"Moonlight shooting has not been a general practice, but as these birds are in motion during light nights they could readily be brought within range by 'honking' them when flying. This sound is very perfectly imitated at Egg Harbor, and I have seen geese drawn at a right angle from their course by this note. They can indeed be made to hover over the spot, and if a captive bird was employed the success would become certain.

"Notwithstanding the apparent facilities that are offered of success, the amusement of duck shooting is probably one of the most exposing to cold and wet, and those who undertake its enjoyment without a courage 'screwed to the sticking point' will soon discover that 'to one good a thousand ills oppose.' It is indeed no parlor sport, for after creeping through mud and mire often for hundreds of yards, to be at last disappointed, and stand exposed on points to the 'pelting rain or more than freezing cold' for hours, without even the promise of a shot, would try the patience of even Franklin's 'glorious nibbler.' It is, however, replete with excitement and charm, and to one who can enter on the pleasure with a system formed for polar cold and a spirit to endure 'the weary toil of many a stormy day' it will yield a harvest of health and delight that the 'roamer of the woods' can rarely enjoy."

Although this far-famed bird was named by its discoverer after the plant *Valisneria americana*, on which it partially feeds when on fresh water, its subsistence is by no means dependent upon that species, which indeed is not extensively distributed, but is chiefly derived from the grass wrack or eel grass, *Zostera marina*, which is very abundant on the shallows and flats along the whole sea coast. Its flesh seems to me not generally much superior to that of the pochard or redhead, which often mingles in the same flocks, and both species are very frequently promiscuously sold in the markets as canvasbacks.

In the plate are represented two males and a female. In the background is a view of Baltimore, which I have had great pleasure in introducing on account of the hospitality which I have there experienced, and the generosity of its inhabitants, who, on the occasion of a quantity of my plates having been destroyed by the mob during an outburst of political feeling, indemnified me for the loss.

AMERICAN ORNITHOLOGISTS' UNION.

THE fourteenth congress of the American Ornithologists' Union convened in Cambridge, Mass., Nov. 9, and continued until Thursday, the 12th.

The evening or business session was held at the residence of Mr. Charles F. Batchelder, the public meetings, commencing Tuesday, Nov. 10, being in the Nash lecture room of the University Museum.

The active members present were: Dr. J. A. Allen, Dr. Jonathan Dwight, Jr., Frank M. Chapman and William Dutcher, of New York city; Dr. A. P. Chadbourne, Charles B. Cory and H. A. Purdie, of Boston; C. F. Batchelder, William Brewster and Montague Chamberlain, of Cambridge; Ruthven Deane, of Chicago; Drs. Elliott Coues and C. Hart Merriam, of Washington; and John H. Sage, of Portland, Conn.

The associate members present during the sessions were: Mrs. Olive Thorne Miller, Miss Florence A. Merriam, Miss Helen A. Ball, Miss Harriet E. Clarke, Louis Agassiz Fuertes, George H. Mackay, G. S. Miller, Jr., Outram Bangs, Judge John N. Clark, O. W. Knight, Rev. H. K. Job, Dr. William C. Rives, F. B. Spaulding, William H. Phelps, J. D. Somborger, Edward A. Preble, Prof. F. E. L. Beal, Bradford Torrey, F. H. Kennard, Edward H. Forbush, Arthur C. Bent, Vernon Bailey, H. D. Eastman, Reginald H. Howe, Jr., George L. Toppan, Charles E. Ingalls, Joseph S. Bigelow, Jr., C. E. Bailey, John F. Ferry, F. Apthorp Foster, John M. Nichols, Philip J. McCook, Charles T. Carruth, Dr. Louis B. Bishop, Frank H. Hitchcock, W. W. Brown, Jr., Ralph Hoffmann.

William Brewster, of Cambridge, was elected president; Dr. C. Hart Merriam and Robert Ridgway, of Washington, vice-presidents; John H. Sage, of Portland, Conn., secretary; William Dutcher, of New York, treasurer; Charles F. Batchelder, Maj. Chas. Bendire, Frank M. Chapman, Chas. B. Cory, Drs. Jonathan Dwight, Jr., A. K. Fisher and L. Stejneger, members of the council.

Dr. Walter Faxon, of the Museum of Comparative Zoölogy, Cambridge, was unanimously elected an active member of the Union. Seventy-seven associate members were elected.

Mr. Wm. Dutcher, chairman of the Committee on Protection of North American Birds, read an interesting and most valuable report of the work done by his committee during the past year. This report will be published in *The Auk*, the official organ of the Union, and reprinted as a separate pamphlet.

The Union was honored during its entire session by the presence of Miss Maria R. Audubon, granddaughter of the renowned naturalist. In her behalf Dr. Elliott Coues laid before the Union some recently discovered manuscript journals of John James Audubon, including the one giving an account of his famous trip up the Missouri River. A vote of thanks was tendered Miss Audubon for her kindness in allowing the manuscripts to be exhibited.

Mr. Abbott H. Thayer's open-air talk, demonstrating his theory of the principles of protective coloration, was one of the features of the meeting. He was given a vote of thanks.

Resolutions were passed thanking Prof. Geo. L. Goodale and the Geological Department of Harvard University for the use of their respective lecture rooms for a meeting place of the Union, and thanking the Nuttall Ornithological Club for the cordial welcome and generous hospitality extended to the visiting members.

There was a good attendance of members and visitors.

It was voted to hold the next annual meeting in New York city, commencing Nov. 8, 1897.

The following is a list of the papers read at the sessions:

1. Original Manuscript Journals of John James Audubon. (On behalf of Miss M. R. Audubon.) Elliott Coues.
2. Ornithological Publications, Present and Prospective. Elliott Coues.
3. The *Fringillidæ* of Dodge County, Wisconsin. Will Edwin Snyder.
4. An Ornithological Tour in Yucatan and Mexico. Illustrated with lantern slides. Frank M. Chapman.
5. Some New England Birds' Nests. Illustrated with lantern slides from original photographs. William Brewster.
6. The Philadelphia Vireo (*Vireo philadelphicus*). Jonathan Dwight, Jr.
7. The Moult of the Song Sparrow (*Melospiza fasciata*) and of the Red-eyed Vireo (*Vireo olivaceus*). Jonathan Dwight, Jr.
8. Notes on the Black Rail (*Porzana jamaicensis*) in Southern Connecticut. John N. Clark.
9. Exhibition of Drawings of Birds, from Life. Louis Agassiz Fuertes.
10. Notes on the birds of Oregon. C. Hart Merriam.
11. A Demonstration of the Principles of Protective Coloration. Abbott H. Thayer.
12. Some Notes on the Nesting Habits of the White-tailed Kite (*Elanus leucurus*). With exhibition of eggs. Chester Barlow.
13. Two Curious Birds' Nests. William Brewster.
14. A Series of Redpolls. William Brewster.
15. On the Terns of Penikese Island, Massachusetts. George H. Mackay.
16. On the Terns of Muskeget Island, Massachusetts. George H. Mackay.

Adirondack Beavers.

WHEN the law was passed by the last Legislature to protect the beavers remaining in the Adirondacks, many considered that the time had gone by when any beavers were to be found alive requiring protection. That the theory was erroneous was shown yesterday. Hon. Jos. W. Russell, of the Saranac Iron Association, has forwarded to the Fisheries, Game and Forest Commission a branch of a tree which unmistakably shows that beavers have been at work upon it. Colonel Fox, superintendent of State forests, received the branch yesterday, and found that the industrious little animals had peeled the bark from the stick and trimmed off with their teeth all the little branches. The limb was found, a part of a dam built by beavers, in Gross Pond, Township 20, in Franklin county, near the Adirondack hatchery and the Saranac Inn.—*Albany Argus, Nov. 10.*

Opossum in Niagara County.

LOCKPORT, N. Y., Nov. 8.—A few nights ago J. S. Hollenbeck, of the town of Royalton, a few miles east of this city, was awakened by the barking of his dog. Thinking that some one was trying to carry off a few hundred barrels of his apples, Mr. Hollenbeck went out in the orchard and found that his dog (which Mr. Hollenbeck claims to be the best coon dog in Niagara county) had caught an animal which he at first thought was a coon; but found was an opossum. Mr. Hollenbeck brought it to me yesterday still alive, and although he has had it since Wednesday night it has not eaten anything. He thinks that the dog must have hurt its throat. Mr. Hollenbeck thinks it is an old animal, but I think it is a young of this year, as it weighed only about 8lbs. In color it is silver gray, much lighter than a coon. This is the first occurrence of this species in Niagara county that I have any record of. Is it not unusually far north? J. L. DAVISON.

Buffalo at Van Courtland Park.

TWENTY-FIVE buffalo from the herd of the late Austin Corbin were shipped from Blue Mountain Park, N. H., Nov. 15, to Van Courtland Park, in the upper part of the city of New York. In view of the scanty feed within the inclosure constructed for them it was deemed unwise to ship more at this time, but there is a possibility of fencing in additional land north of the present inclosure, in which case more buffalo will probably be brought on.

Dark-Colored Rattlesnakes.

PROVIDENCE, R. I.—Having seen the melanotic variety of our rattlesnake in Intervale, N. H., last September, I am interested to obtain more particulars regarding the dark-colored ones Aztec observed in the mountains near San Luis Potosi. Have any of your correspondents ever seen other dark varieties of rattlers elsewhere? No American author has noticed them apparently. A. S. PACKARD.

A Snake in a Grouse.

RUTLAND, Vt.—*Editor Forest and Stream:* Dr. C. A. Gale, of this city, on Oct. 17 dressed a ruffed grouse that was shot Oct. 12 that contained in its crop and gizzard a green snake fully 14in. long. About 2in. of the head end was in the gizzard. The rest was in the crop and the tail was still wiggling. The Doctor is preserving the snake and gizzard in alcohol. DALG.

Deer and Lilypads.

WE have several communications on this subject, which will be given next week.

The Sportsman Tourist.

IN THE CASCADES.—IV.

The Waldo Lake Country.

IT was late when we turned out Tuesday morning. All except Christy were more or less tired from the previous day's exertions, and as for myself I was pretty well knocked out. Physically Christy is a most remarkable man; in fact about the toughest, hardiest man I ever went with into the mountains. Mears insists that he is just as tough intellectually, and a whole circus under one tent, including acrobats and trick mules. But Mears is prejudiced. Christy seems to delight in physical exertions that would kill anybody else. If there is anything in the doctrine of transmigration of souls Christy may at some time in the future find himself bell-wether in a flock of mountain goats.

I believe that Mead was about *hors de combat* also, but he prides himself on his endurance and wouldn't give in. He is nearly as obstinate as Christy.

Being somewhat the oldest and fattest of the crowd, I claimed the privilege of looking after the camp and providing the fish. The fact that we had caught enough trout the previous night to last the camp for two days inclined the boys to the belief that I intended to put in the day sleeping, and I guess they were about right. However, the boys were generous and made no objection. The fact of the matter was that I had fully made up my mind that the country was entirely too rough for fat men to hunt in and that I wouldn't hunt unless I had to.

The boys struck out, but returned early empty handed. They all reported plenty of sign. Christy declared that in all his long and varied hunting experience in this country and British Columbia he had never seen more, but the dryness and roughness made it next to impossible to approach game. Bear tracks were innumerable and of all sizes.

At several places we encountered one in particular as large as the crown of an ordinary man's hat and with toe nail marks that looked decidedly grizzlyish. It is claimed and generally believed that there are no grizzlies in the Cascades. No reason has been given, to my knowledge, except that it is too wet a country. But Mr. Fox, the surveyor at Detroit, whom I mentioned in my first paper, told me afterward, when I spoke to him of the track we had seen at the lake, that he and his partner had on two different occasions seen an immense grizzly near Mt. Jefferson; once within a few rods. It is a pretty well-known fact that a grizzly has made his home at the headwaters of the Molalla for years, and a Mr. Clark, of Oregon City, told Mead and I recently that a young grizzly was killed there this summer and brought into Oregon City.

Undoubtedly there are grizzlies in the Cascades—not many, but some. The bald or mealy face has been killed both in the Coast and Cascade ranges. Brown and black bear, particularly the latter, are very abundant all through this country.

This was an uneventful day. Myers brought in the packs that had been ignominiously dumped at the foot of the P. Warmer, which completed the comfort and convenience of our camp. We fished some, but the fish declined to respond to our most seductive casts, so we spent most of the afternoon sitting around camp, taking it easy and watching the maneuvers of the mischievous camp robbers or whisky jacks. As all mountaineers only too well know, they are the most impudent and yet the most entertaining of all mountain life, and I for one never tire watching them.

When night came we went out and repeated our experience of the previous night with the trout, except that we went later and returned to camp earlier with somewhat less trout. But we had fished slowly, and returned the smallest to avoid waste. These moonlight trouting experiences at Waldo Lake were among the most delightful of my whole sporting life, and, as Mead remarked, leaving out the P. Warmer, one night on that lake was worth all the expense and discomforts of the whole trip.

I wish that I could describe one of those moonlight excursions as we saw and felt it, but I can't. Of course, I have fished by moonlight before, but never under such novel conditions. Standing upon a frail log raft of scarcely sufficient dimensions to sustain our weight, we would slowly drift out like specters upon the placid bosom of the pretty lake and cast our black flies upon its dark, unfathomed waters. No mirror ever reflected more truly than did Waldo Lake reflect every peak, every tree, every twig of its surroundings. Through the pure, rarefied air the stars and planets looked unnaturally large and luminous. They too were reflected back in all their splendor and we were made to feel that we were suspended in ethereal space, with stars above and below us, and that we were beyond the reach of the law of gravitation. Continuing the comparison, the surface of the lake was like the face of a polished mirror, hardly discernible except when some greedy trout came up from the depths and struck at some real or imaginary fly. Then silvery ringlets would spread away and die in tremulous light and again the stars would look up at us from below. The mountain peaks, bright in the moon's clear, full light; the lower forests, dark in the gloom of their own somber shadows; the starry lights above and below us; the all-pervading, death-like stillness—all made us feel that we had in some unaccountable way been spirited away from earth to those occult regions of nature's domain from whence no traveler returns. Then the sharp, vicious tug of some big rainbow would bring us back to a realization of our mundane environments. Our casts had to be made toward the moon, for behind us our shadows were indeed frightful to behold. They looked like ogres, wielding immense clubs with hawser attachments.

Next day Myers wounded a big buck which got away, and Christy killed three black bears within two miles of the camp. So we had plenty of fresh meat, such as it was; but b'ar meat—even such as this, berry fed—is not a meat that I hanker after to any great extent. We all carried .38-55 guns, Mears and Christy Marlins, Mead and myself Winchesters. Either make is good enough, and no better guns are made for all-round work in the mountains. I let Myers use my rifle and I did nothing but fish, and so we spent our time at Waldo Lake. We had all the game and fish that we could possibly use and more, but

the boys jerked some of the meat and dried some of the fish. Nothing was wasted.

The time came when it was necessary that I should return to Portland. I came home a few days in advance of the others. I dreaded the trip out, but Myers and I took the two pack horses and started. The little roan cayuse got out all right, but poor Flora, Ed's big brown mare, fell over a precipice and we had to shoot her and let her go on down into the Brightenbush, where the bears have doubtless found her ere this and feasted upon her poor carcass. Ed felt her loss sorely, for she was all he had, and besides, as he said, she had been a kind, faithful animal.

He actually shed tears—but they were manly, sympathetic tears.

I deeply sympathized with him, and told him that when the boys came out we would see what we could do for him. But when generous, kind-hearted Mead heard of Ed's loss he promptly paid him her full value as fixed by Ed himself. Only those who have hunted and fished with Mead for years, as I have, know how generous and sympathetic he is, and although he sometimes gets a little off color when he can't have his own way about everything, he always follows the good old Bible doctrines of do unto others as you would that others should do unto you, and let not your left hand know what your right hand doeth in charitable matters. He will kick when he reads this little tribute from his old sporting friend, but it will be too late then, and I am glad of an opportunity, for once, to tell on him.

The loss of the mare compelled Ed and me to lie out in the mountains one night, and so I missed the train at Detroit next morning and had to put in the whole day there. Politics was the all-absorbing topic, and strange but often forcible arguments did I hear. One old fellow clinched his argument for McKinley and protection with the following broad but doubtful assertion: "When Harrison was Pres'dent you could go right down to the Santiam hyar a'most any time and cotch a 2ft. trout; now you sca'cely ever see one over 1ft. long." Whether he meant that our good Democratic President had been fishing the Santiam, or that its trout needed Republican protection on principle, each reader can determine according to his political bias or education.

At Gates, twenty miles below Detroit, I observed over a saloon door this rather novel and suggestive name, "Gates Ajar Saloon." The hotel proprietor at the same place had neatly worked the word "hotel" in moss over his door, and an old timber cruiser who had been sitting near me and trying to entertain me all the way down took advantage of the circumstance to remark that while these people were all kind-hearted and generous, they were as a rule powerful ignorant. "Jist look at that hotel feller," he remarked, "he's spelled hotel with one l." Yes, we do meet some rather peculiar characters in the mountains, but no better people live on the face of the earth.

There is lots of game with plenty of fish in the Waldo Lake country, but the trail is too rough to ever make it a popular resort—for fat men.

Christy and Mead are already planning another trip to the same country. They have my sympathy unless they attempt to take horses in. In that case my sympathies are transferred to the poor horses. I shall never forget those delightful moonlight fishing excursions, and now whenever I look at the moon some way I can't help thinking of Waldo Lake.

Oh, lovely lake, deep buried in the hills,
Enshrouded in clouds! And in your jeweled grave
Lie secrets, too, which fickle nature gave
To your safe care from Time's relentless mills,
That grind full slow, but grind as nature wills.
Far down where your unfathomed waters lave
The walls of precious stone and emerald cave,
Where silence deep the heart of nature stills—
Yes, deep down in that grave of mystery
Lie buried secrets of the hoary past
That wrinkle Time, and in whose history
The elves and sprites in terror stand aghast.
But calm in this, your dark consistory,
Dame Nature hides her secrets to the last.

S. H. GREENE.

PORTLAND, Oregon.

THE RANGELEY LAKES IN OCTOBER.

RANGELEY LAKES, Me., October, 1896.—The past fishing season has been favorable both in number and size of trout, and fully up to the usual standard. A notable increase of visitors was occasioned by the completion this spring of the railroad from Rumford Falls to Bemis on the great lake, and the road is expected to run all winter in connection with logging interests.

While the State of Maine since Oct. 1 has been credited with a large influx of sportsmen with shooting irons, the Rangeleys have not in this respect been overcrowded, although the number is in excess of that of previous years.

Not a large number of deer have been slain thus far, although thirteen deer and part of a moose are at present hanging on the porch of the principal camp on the large lake, where fourteen hunters are domiciled.

Directly about the two Richardson lakes perhaps a dozen and a half deer have been shot so far, of which the writer with two companions shot three during the first week of the month.

Since the first week the condition in the forest has been unfavorable for stalking, owing to the great fall of leaves, which have been dry and crisp, and has made it almost impossible to get up within sighting distance. With a good, soaking rain and some following misty weather the condition would again become favorable, as the carpeted ground would become soft and noiseless for the stalker. This condition can be the only one expected favorable for still-hunting until the snow comes.

With the approach of cold weather deer become more timid than at any other season of the year.

During the summer, while the deer have been seen daily about favored localities on the lake and pond shores, they have been easily approached, and have allowed boats to come within a hundred feet or so without exhibiting much alarm. I have repeatedly during the summer approached within very short distance of them, finding them sometimes feeding along the shores and at other times well out in the water.

In some instances they would go off in a bounding, frightened manner when too nearly approached, and at others with a slow walk, and in some instances simply to retire in sight behind the fringing bushes of the shore and remain peeping through until the intruder departed, and then return to the water.

At one fishing place near a lilypad growth, which I frequented during the summer, I always found two or three deer about, and one doe with her fawn became conspicuous by her constant frequenting of the spot, and would allow a very close approach; but when I ventured too near would simply retreat a short distance, and as I retired return to the pads and grasses.

So for a number of days I had her company at my fishing, and on two occasions she brought out her fawn for inspection—a tiny kid, which paddled about the shore while its mother grazed in deeper water.

We often notice the inclination of animals and birds to frequent the immediate vicinity of human beings, and invite their companionship, evincing a disposition to be friendly if they could, but, alas, too often compelled to pay the penalty of death for their temerity.

One might consider, from the advertising of game in the State of Maine, that the woods swarmed with deer; they may in some parts, but not about the Rangeley lakes. They have visibly increased in the past few years, and the occasional visitor in the summer, by often seeing deer in the water at the retired ponds, might assume that the woods were full of them, but such is not the fact, as many sportsmen during the past few weeks who have been out daily will attest. A large proportion of the deer come to the water in the summer, and it may be doubted if they are much in excess of one to the square mile of forest. At this season they are doubly cautious and shy, and if observed browsing in the woods appear to be on the closest guard, and steal off upon hearing the slightest crackling of twigs or rustling of leaves, and generally before being observed by the sportsman. When lying down, they will often rest until sighting the intruder, sometimes allowing a close approach, expecting possibly to be unobserved, and when rising will immediately bound off at a rapid rate, and most adroitly take advantage of shielding trees or bushes to cover the retreat. Rarely they will stand a moment or so before the sportsman or bound off in the partially open forest, and occasionally, under favorable conditions, they are first observed. These are the opportunities sought for by the sportsman, and fortunate he is if his shot is a stopping one; for often, although fatally wounded, they will travel for miles.

It is undoubtedly owing to the rigid Maine laws that deer are increasing about the lakes, for the practically enforced regulations against shining and crusting give an opportunity to increase, and they do so slowly but surely when protected and free from wolves, as in this locality.

The feed is prodigal, as evinced by those killed, which are invariably fat and full, and there is room for many times more than those already about.

Trout are also well protected and plentiful, and no season has been better than the last, and if the fishermen who displayed their skill at the Upper Dam during the season could see the large trout on the spawning beds now they would hardly expect any diminution of the noble fish in the immediate present. The water below the Upper Dam has been drawn down about 2ft. since Oct. 1, and the shallows below are covered with large trout of 4, 5, 6 and 8lbs., who make great commotion and exhibit their immense backs and tails with prodigal profusion. Ornamented as they are now in their highest colors, they present a most fascinating sight; now swimming along in pairs at a slow pace, then whirling in great eddies, then plowing across reaches with speed and streaming wakes.

With cautious steps they can be approached to within 10 or 15ft. and most closely observed, and if disturbed and driven away to deep water will speedily return.

I have never in many seasons seen the beds below the Upper Dam more fully occupied by large trout than now. Many believe the trout to be less plentiful than before, and prophesy that in a few years trout fishing at the lakes will be a feature of the past, but I do not agree with either opinion, and my annual experience extends over nearly forty seasons, and I have been here during the last season from its commencement in May to the end, and short enough it has seemed.

Particular fishing places do undoubtedly become more or less depleted, as notably that below the Upper Dam, which has been constantly occupied, not only during the day, but far into the evening. The boats about the pool have been so thick that one could hardly fish any time there without being entangled.

Although many trout come in there, they bear but a small proportion to those in the lakes. They are well distributed, and the favored fishing localities but few. Probably nine-tenths of the trout have their spawning beds in retired places, in comparatively still water and entirely unknown to the average visitor. The larger proportion are already upon the beds or through, but many families and tribes will come on later and spawn beneath the ice in December, and as late as January. I have watched them many seasons through the ice.

I think next to man the blue heron (*Ardea herodias*) is the greatest destroyer of trout at these lakes. This bird is an incessant nocturnal as well as daily feeder, and of inordinate appetite, and although its principal food is chubs and frogs it destroys a great many trout and will get away with ¼-pounders, if not larger. They will have no hesitancy in striking and fatally wounding trout of over 1lb. in weight. Yearly I see trout swimming about which have been struck and pierced by this bird, and this year I caught two which were unfit for food, each over 1lb. in weight, having holes in the back nearly through them as large as pipe stems. It may be a question if this bird, of which hundreds frequent the shores of the lakes from the early spring to the ice, do not in the aggregate kill more trout, principally small ones up to ½lb., than all the fishermen. Aided by the loons, kingfishers and mink, they undoubtedly do. The latter, the mink, is a voracious feeder, and will destroy large numbers with the greatest ease from congregating pools and the breeding streams which feed the lakes.

A mink will kill a dozen 1lb. trout in a day when they are easily accessible, eating only the heads and leaving the bodies to decay. If one can get into a fisherman's car it will strip it clean of trout in a single night, even if there are several dozen, and carry every one off.

I had a car, which was accidentally left open, stripped one night last month of a dozen trout weighing from 1 to 2lbs. It was a very large car, having but a small opening in the top of about 8in. square, and was but half submerged, leaving fully 1ft. of raise from the water to the exit aperture. I could hardly see how so small an animal as a mink could haul out trout weighing more than itself; but a few days after, when I had replenished the car with ten or twelve more trout, one or two of which pulled above 2lbs. and one nearly 3lbs., I saw how it was done. I was sitting upon the shore when I observed a commotion in the car scarcely 40ft. from me. It was covered, but the trout were splashing about at a great rate; and presently I saw a mink appear on one side of the box, swimming about and beneath it, endeavoring to find entrance. I watched him for some minutes with great interest and amazement. He would swim around the box several times, then beneath, then crawl up the sides and inspect the top, then dive down beneath again and appear up on the other side, then hesitate apparently on top for reflection, and then in the most active manner commence his journey around and about the box again. He paid no attention to me whatever, as I remained perfectly quiet. He finally dove into the water and disappeared. Interested to know how he would act in taking the trout, I took advantage of his absence to go to the box and remove the cover, and returned to my previous sitting place. In a few moments I saw him appear at the box again; he swam about several times before mounting. On top he immediately discovered the opening, down which he disappeared. At first I thought I would run up and replace the cover, but then it occurred to me that I should perhaps catch a tartar; and besides I wished to see how the work was done, as I had been the victim of several losses of this character. The splashing in the car indicated his entrance, and in half a minute he appeared at the top dragging out a struggling 1lb. trout. But the struggles were comparatively faint, as the mink had evidently given the fish a distinctive quietus. Down into the water he slid and disappeared. I saw him soon appear along the shore above, when I lost sight of him. In less than three minutes he appeared again at the box and repeated his first act with a second trout, which he disappeared with as before, and returned after about the same lapse of time. The third act was more prolonged, as he attacked the largest trout in the car, heavier than himself but finally dragged it out and carried it off. I concluded it time to put the cover on the box and end the play, well satisfied that otherwise all the trout would soon disappear.

Now, the latter part of the month the blueback trout (*Salmo oquassa*) are spawning, and swim in large quantity in the shallows below the Upper Dam. They are not visible during the day, but at night come on in large numbers, and do not appear at any other season of the year. They are said to be an Arctic trout, and not found, that I am aware of, south of the region of the Rangeley lakes. They never take the fly or bait, and when taken at the spawning grounds are invariably with empty stomachs. They are very handsome, with very pretty heads and large eyes, are swallow or forked tailed, and carmine spotted, with blue backs. They average about 7in. in length, and about five to the pound. Occasionally one weighs ¾lb., and one has been caught this season of ¼lb. and 11in. in length. They are caught by wading in the shallows with a lantern and dip-net. They are much more tenacious of life than the ordinary trout. I have had them out of the water an hour, and apparently lifeless, and resuscitated them by putting in the water again, and a number will live in a barrel of water without change for weeks, which would be fatal to the ordinary trout. For food they are passably good, but not superior. Their teeth are very fine and plentiful, and they evidently live on ground feed and the variety of infusoria which are so plentiful in the lakes. The large trout feed on them more or less, and they are occasionally found in them.

They undoubtedly inhabit the deepest water in the lakes. The only one I ever saw out of season I picked up some years ago on the surface, which was in a dying condition, having been wounded evidently by a loon, as evinced by a large hole through its body.

They remain on the spawning beds during the nights of about a week in the latter part of October, and sometimes swarm in such quantities that barrels full could be taken if nets were used.

J. PARKER WHITNEY.

MASSACHUSETTS AND MAINE.

BOSTON, Nov. 14.—Some remarkably good shooting has been enjoyed right in Massachusetts by those well posted on the grounds, and having good dogs and the opportunity to go after birds when the weather has favored. A number of coveys of quail have been located in Dedham, and Boston hunters have got some of them. G. H. Smith got half a dozen the other day. In Reading also a number of quail and partridges have been taken lately. In Byfield the shooting has been excellent. C. H. Tarbox and the Baileys have had their share of them. The other day they started several bunches of quail, with thirty or forty in a bunch. One day last week Mr. Tarbox, with the aid of his dog, started seven partridges at one outing, and within a short distance of his home. He was fortunate enough to get four out of the seven. Black duck shooting is also good in that section. A local gunner got twenty or thirty birds out of one flock the other day. The Plymouth county lakes and ponds are being worked for both ducks and geese, and with considerable success. The clubs having shooting camps, blinds and other privileges are the best off. Some Boston club sportsmen got twelve wild geese at Pleasant Lake the other night.

Dr. Heber Bishop, who has the best moose record of any sportsman in New England, if not in the world, is out of the woods again from the Moose River Valley. He was accompanied by a friend, Mr. Arthur Wilson. They brought out four buck deer and a bull caribou. One of the deer was the largest on record, Dr. Bishop thinks, and his opinion is good, coming from much experience. It weighed, bereft of everything but meat, hide and horns, 282lbs., the exact weight the American Express Co. charged for the transportation of it. In its state as killed it must have weighed over 350lbs. Dr. Bishop is skeptical about the weight of deer as well as moose, having found the latter oftener under 150lbs. than over. Frequently a large deer is killed. The guide declares that it will weigh 250lbs., but put on to the scales the sportsman is disappointed at finding that it barely tips 150lbs. The weight of moose the Doctor finds to have been greatly exaggerated. He has killed a large number and seen a large

number, but scarcely ever seen one on the scales above 475lbs. He says that a moose weighing 900lbs. is a big one.

George Cherry, of Essex street, is out of the woods with a fine moose, which was displayed in the window of his restaurant. It was shot at Cherryfield, Me., or in the vicinity of that town. He has in his refrigerator a number of deer and four bears. Speaking of bears, the number coming in to the Boston markets is unusually large this fall. Two were sent in for sale to Messrs. Hyde & Wheeler the other day. They were from Bethel, Me., and killed in that vicinity. The shipper informs Mr. Wheeler that some twenty bears have been killed already in the vicinity of Bethel or north of that town. They have visited the apple trees near to the forests or on abandoned farms, and have actually broken down great limbs in order to get the apples. They are generally taken in traps.

Mr. James B. Jones is another sportsman who has been remarkably successful near home. Early in the season he had several broods of quail located in the town of Topsfield. The first day of the open season he could not get away; but the second day he was there, with a friend and dogs. Twelve quail and a woodcock resulted from the day's shooting. Mr. Jones says that he never had better sport in his life. He will try the same location again at Thanksgiving.

From 4 to 6in. of snow in the woods of Maine and New Hampshire has started a number of sportsmen after big game, but the weather is too mild and the snow is likely to depart before the moose, deer and caribou suffer too badly.

A Worcester, Mass., party, consisting of F. M. Harris, Calvin Macomber, Ralph Morgan, Samuel Alden and O. C. Ward, returned Saturday night from the Moosehead Lake region, where they killed in three weeks ten bucks and three does. Moose were seen and a shot got at a bull, but he escaped. SPECIAL.

Game Bag and Gun.

Our readers are invited to send us for these columns notes of the game supply, shooting resorts, and their experience in the field.

WATER KILLING DEER.

Editor Forest and Stream:

Deerslayer claims that the gentlemen who wish to prohibit hounding are fancy shooters, etc., while he is an old-fashioned hunter. This phrase suggests to me the species (rapidly becoming extinct, praise the Lord!) whose habit it was to shoot two dozen partridges in one shot as they sat on the ground in a bunch. Deerslayer claims that 5,000 deer were killed in the Adirondacks last year, and that therefore they are not becoming scarce. This is an absolute reason that the deer are becoming scarce; no circumscribed piece of country can stand such a drain. Deerslayer says that they will last his time. It is hardly necessary to suggest his sublime disregard for posterity, even for that courageous chip of the old block who succeeded in slaughtering a deer after a guide had it tied up for him to murder.

By his own account the deer has absolutely no chance, and the method has wonderful advantages, for it could be executed by an infant or an invalid. The sportsman-butcher has absolutely nothing to do except to point a shotgun and pull the trigger. The guide rows after the deer, ropes it and holds it while it is shot. Mind, the imbecile is not even expected to use a rifle.

One suggestion would not be out of place. This is that Deerslayer confine his sporting instincts. If he would shoot calves in his back yard, we are sure it would be more pleasant for all concerned. PINEHURST.

SOUTHERN MASSACHUSETTS.

Editor Forest and Stream:

My hunting days have long been over, for I am past four score and my sight has failed so that I can no longer shoot, and reading is so difficult for me that I rarely attempt it, and I have become so deaf that no one can read to me for any length of time. Occasionally, however, when my son meets with anything of special interest he brings it to me, and he has just called my attention to the letter of Deerslayer in your paper of Oct. 31.

It has stirred my blood to such a degree that I cannot restrain the expression of my indignation that anyone who pretends to be a sportsman should advocate such a sneaking method of killing deer, worthy only of the meanest pot-hunter. Such a man would shoot barn-door fowls in a barnyard and think it legitimate sport; and then to assume the pseudonym of honest old Natty Bumpo—that model of a sportsman! It's enough to stir his bones in their grave!

He asserts that game laws are needless; that there is no danger of exterminating game; that all the talk about "still-hunting" and "shooting on the wing" is nonsense. If one wants real sport let him put his dogs into the wood and lie close till they drive a deer into the lake, then chase him in a boat and put a rope over his antlers and hen put a charge of buckshot into him! The man who would kill a deer in such a way is no better than a murderer, a sneak thief or a pickpocket. He is precisely the kind of cockney sportsman who make game laws necessary. A mere sensualist, whose only object is to gratify his palate. In reply to his assertion that there is no danger of deer becoming exterminated, I need only point to notorious facts. Have they not become exterminated from all the settled portions of New England except a few preserves? Have not the buffalo which once roamed in countless millions on the prairies been so completely exterminated that the only representatives left are the few that have been domesticated in private herds? And finally have not the Indians themselves—the wild men of the forest—been exterminated, with the exception of the few scattered remnants of tribes that have adopted the dress and habits of the white men?

Writing has become so much of a task for me that it has taken me two days to write these few lines, and this is probably the last contribution I shall ever make to your columns. But with my latest breath I would denounce the man who would resort to such unsportsmanlike shifts, and I trust there are men enough left who share my feelings who will cry out against such contemptible theories as are advocated in the letter of Deerslayer. H. W. S. CLEVELAND.

CHICAGO, Ill.

Editor Forest and Stream:

In am somewhat surprised at the reception given my note respecting the hounding of deer. The character of the responses is not at all what I had anticipated. Just review the epithets that have been bestowed upon me. The *Mail and Express* editor calls me a human fiend, a cheerful assassin, a diabolical Kurd, a creature whom an inscrutable Providence permits to live, a brute, butcher, deer butcher. My son is called a precocious cub. I am advised to run a slaughter house, to take a place in the Union Stock Yards at Chicago, and one correspondent exhorts me to set my old grandmother afire and kill her with a crowbar. (This, naturally enough, comes from the grand old Commonwealth of Massachusetts, with its record of twenty human beings, mostly old women, and two dogs executed for witchcraft.) Another writer, more humane perhaps than the rest, would annihilate me at a stroke by calmly denying to me any existence at all; he appears to think me a myth. The whole thing reminds me of what I've read of the old days, when you put into the pillory the writer whom you didn't agree with, and cropped his ears and plunked him with rotten eggs.

I beg to extend to all these kind critics assurances of my most distinguished consideration. I shall not return their compliments, not on such short acquaintance. A true deer hounder will not resort to blackguardism. He is able to conduct a discussion in a gentlemanly way. But does it not occur to you that this reverting to the old system of putting in the stocks one who does not agree with you is a very poor makeshift for real argument? And is it surprising that I am not converted by your calling me bad names? That I fail to find in any of the communications printed any one thing which could possibly be dignified as an argument to appeal to sensible men?

Let us consider some of the propositions advanced by the advocates of the system of still-hunting. First comes the grotesque notion of the *Mail and Express* man that the only truly sportsmanlike way to hunt deer is to shoot at them from long range, and he implies that he thinks that the longer the range the more sportsmanlike the act. Now if there is any one thing in the whole realm of sportsmanship which disgusts me for the diabolical cruelty it involves, it is this very same long range shooting at game. It stands to reason that the longer the range the greater the opportunity to wound without killing, and the more then is the cruelty involved. Long range shooting is not sportsmanlike; it is the kind of work indulged in by novices and greenhorns who are making their first warfare against game. These long range fellows have more to answer for than all the rest of the sportsmen community put together. It is they who pump lead at fleeting bands of elk and bunches of antelope, hurling after the game their bullets, where they can do nothing but to maim, with not the slimmest chance of recovering their victims. It is the tyro who shoots at ducks or quail at distances where no man with any brains in his head could expect to do anything more than to wound. These are the maniacs, who shoot without sense or reason. All through the woods you can find the disgusting evidences of their work in the game "shot down and left to taint the blessed air," as Nessmuk puts it.

Now, Mr. *Mail and Express* man, the next time you have wounded your game at long range and have followed it for awhile, and then, becoming tired of the weary pursuit, abandon it to its fate, while you sit down on a rock to exult over your only truly true sportsmanship, and to swell up with pride in your self-adulation at being so much exalted above the fiendish deer hounder—just let your conscience talk to you about the poor beast which has escaped from you, sorely wounded, and to suffer for no one knows how long, and then—but why talk about this? The long range hunter probably is blessed with a long range conscience. If the deer could talk they would probably tell us that from their standpoint the practice of the man who makes short work of them with guide and boat (and noose, if you please) is a less terrible being than the long range hunter who wantonly wounds to gratify his idiotic pride in fluke marksmanship.

Another thing that makes me tired is this still-hunter's cant about "giving the game fair play" and "pitting one's skill against that of the deer." What is this much vaunted fair play? Why, a still-hunter simply sneaks up on his game and kills it before the poor thing suspects his presence. Did you ever hear of a still-hunter, when he had come up on his deer, whooping and hurrahing and waving a red flag, and getting it on the jump, to give it "fair play" before he shoots? Not much. Of all sportsman's cant, say I, this of "fair play for the game" is the thinnest, silliest and most pharisaical.

Yet this talent for sneaking possessed by a few they present as the only simon-pure, correct and refined sportsmanship, and this in language foreign to sport, by denouncing the other fellows as fiends and Kurds.

And what does "pitting your skill against the game's cunning" actually mean? It means that you put not your skill against that of the game, but the skill of the man who made your gun, of the boy who loaded your cartridges by machinery, of the guide who takes you to the woods and puts you on the trail, and who, if you are a moose hunter, calls up the game for you and tells you "Now shoot." It is pitting not your "skill," but fire and lead against the game. You might as well talk of pitting the skill of a commander of a warship against the cunning of the helpless women and children in the town he is bombarding with dynamite guns. If the deer too had a gun and knew how to use it, there'd be some "pitting" for sure—that is, if your valiant still-hunter ever ventured in the woods looking for "fair play."

What rubbish to talk of the cunning of a deer when it is sneaked upon by the still-hunter, and when it is shot without even knowing it is in danger. What rubbish to talk of an equality between the cunning of a deer and the cunning of a man armed with a repeating rifle. Can the deer have a cunning equal to that of the man? No. Were it a thousand times more cunning, man is more so; and yet we are told that the deer's cunning opposed to the infinitely greater cunning of man, reinforced with a rifle, is an equality.

Now don't you think that you are overworking dear old Nessmuk when you quote him as a patron saint of your style of still-hunting? If I remember rightly, Nessmuk used to go into the woods with just three bullets. He said that that was enough for him. Is there one among you who would follow his example? Why, in this same issue of FOREST AND STREAM containing your letters I find a story from a correspondent who went into the Rockies and took with him 200 cartridges. Not long ago some one else told about his party taking 500 rounds of ammunition apiece. In heaven's name, for what? To give the game a chance? Nessmuk was a little man, not a giant; honest now, wouldn't he have staggered helplessly under the modern up-to-date still-hunter's load of 500 cartridges? My notion is that he would have fallen down. Faugh! what would Nessmuk (honor to his memory) say to your calling him to witness for you? It reminds me of a story I read the other day about a dramatic company's playing of Hamlet. "We could settle the Shakespeare-Bacon controversy right now," said one who was present. "How?" "Just go and see which one turned over in his grave last night." Poor Nessmuk!

Do not misunderstand me. I am not criticising your methods in the least. If you prefer to sneak up to your game as an assassin on his victim, that is all right—so long as the game holds out and there is enough to go around, so that we can all take some in our own approved ways. For my part, I like the music of the hounds, the exultation of the chase (particularly if there are half a dozen boats heading for the same deer), and the satisfaction of knowing after I have gotten my game that it was taken expeditiously and without flummery, and that there is no chance for it to go off in the woods and lie down in prolonged agony, as it might have done if wounded by one of you long range sportsmen. Moreover, after I take my one shot and kill my deer I do not feel that I am less of a sportsman than he who goes about with a gun stuffed from end to end with cartridges, whose belt around his waist is stuffed with many more and whose baggage is overweighted with hundreds more.

Now, I repeat that in all the letters printed in the reply to mine there is not one word of argument to show why the Legislature should forbid the hounding of deer in the Adirondacks. You surely do not expect the Legislature to be influenced by your wholesale denunciation of me as a bogy man. I am not likely to appear in the eyes of the men at Albany such a monster that they must needs enact a special law to deal with my particular case. The whole substance of your argument is that you kill your deer differently from how I kill mine, and that the ego and the right are the same thing.

The editor himself concedes that game laws are not passed to require so-called "sportsmanlike" methods of game killing. Game protection is only a question of keeping up the supply. It rests therefore with the opponents of deer hounding in the Adirondacks to show that deer hounding decreases the deer beyond the recuperative powers of the stock. We deer hounders have on our side the authority of Chief Fish and Game Protector Pond, that hounding is not injurious in its effect upon the deer supply, and I cite his opinion as worth more than all the hysterical statistics given out by the men whose arguments are four-fifths emotional denunciation and one-fifth statistics. Horace Greeley once said that there were three kinds of lies—lies, blank lies and statistics.

Most deer killed in the Adirondacks are killed by hounding. The same is true of Maine. And yet in both regions the game is on the increase.

To sum it all up, deer hounding is more humane than still-hunting; it gets the deer without unnecessary cruelty; it does not ruinously deplete the supply; it is a method in which more hunters can take part than in any other. There may be two hundred hunters out about a body of water where only one deer is killed. Hundreds and thousands can take part in deer hounding who cannot still-hunt. The rights of the majority should be respected in this as in other things. That is the true American doctrine. The deer hounders can as justly claim that their rights and privileges shall be protected as can the still-hunters.

Now, gentlemen, just one last word, more in sorrow than in anger: Denunciation is not argument.

DEERSLAYER.

The *Record*, of Wells, Hamilton county, declares that 1,000 deer were shipped through that village during the last week of the hounding season.

THE MAINE MOOSE SITUATION.

BOSTON, Mass., Nov. 6.—*Editor Forest and Stream:* In your issue of Oct. 31, under the head of "Parting Shots at Maine Moose," is an article which I have read with much interest. Growler is very much to be commended for the interest he takes in the preservation of the moose, but I cannot agree with him that it is necessary to make a close time for ten years, or for anything different from the law as it stands to-day. If the present law was enforced to the letter, moose would be well taken care of, and in my judgment would rapidly multiply. In making this assertion I desire to say that I am casting no reflections on the Game Commissioners or their Assistants, or on the work that they have done, and from what I have been able to learn this work has been more thoroughly done this year than ever before, and they should receive nothing but praise from all sportsmen.

The hunting grounds of Maine cover many miles, and I imagine that the Commissioners have not sufficient funds at their command to thoroughly cover all the points as they should be for a proper protection of game.

Growler says, "Another reason why bull moose of more than two years of age are getting scarce in Maine is that all the large males can be called in the love-making season," etc.; but he neglects to say that this love-making season is in close time when game is protected by law. The rutting season is at its best early in September and is practically over by the first of October, and my own experience, with one of the best moose callers in the State as a guide, is, that it is next to impossible to call out a large bull after that time; and if my experience is the same as that of other hunters there seems to be no occasion for a closer season for this reason given by Growler, as October first is the earliest time when game can be killed lawfully.

The assertion that few large bulls are seen is accounted for by the fact that a larger part of the hunting is done in canoes, and while small bulls and cows frequent the streams and meadows, the large bulls usually are back on the bogs and out of sight; thus giving the impression to anyone who has not carefully looked into the question that, while there are plenty of cows and yearlings, there are no large bulls. I have just returned from a two weeks' trip in the Maine woods and have seen more evidences of the increase in moose than on any trip I have

before made. I had the good fortune to run across two bulls who were quietly feeding. I found them quite tame, but inclined to dispute my right to land from the canoe, but they finally concluded not to do so, and leisurely trotted off. I could have shot them both without difficulty, but as I had already killed one, I refrained from doing so, although the temptation was strong.

On my way home I met a gentleman who run on to three bulls together, and leisurely picked off the largest. These two experiences will show that there are a few bulls left.

It is undoubtedly true that there have been many bulls killed this year, probably more than were killed last year, but I claim that the larger part were killed in the close season. I have hunted in Maine for many years, and have an intimate acquaintance with many of the best guides, and they all assure me that it is a fact that nineteen out of every twenty bulls that are killed are killed in September during the rutting season, the "sport" remaining in camp over into October long enough to be able to claim, if questioned by a game warden, that his bull was taken in that month. To confirm the assertion that I have just made I desire to state a case that came to my notice this season. I started into camp Oct. 2, and my first day out I met a party on the way home with a head, and the skin and particles of flesh on the skull were as dry as though baked in an oven; the hair was of a very peculiar color, different from any that I had seen before. Two days after this time, while hunting in the locality where this bull was shot, I was attracted by a strong smell coming from a certain point, and on an investigation found portions of a moose hanging in a tree, hide on, and with this same peculiar colored hair as seen on the head, showing that they without doubt came from the same animal; the meat had been taken possession of by maggots, showing conclusively that the animal had been shot in September, and during the early part at that.

It is a fact that is unquestioned that many thousand dollars are spent each year in Maine by sportsmen which would not be spent if there was a close time on moose for ten years or less, and this fact alone should be enough to induce the Maine Legislature to appropriate money enough to enable the Commissioners to properly enforce the present law; and if this was done, in my judgment, the problem of the increase of game would be solved.

I have thought for some time that if the Commissioners could devise some plan to interest the guides in the protection of game, they would receive very valuable assistance from them. At present, however, the average guide looks upon a game warden as his enemy, and is therefore indifferent. This has been largely brought about by the employment in the past of incompetent wardens; but I am inclined to think that the weeding out process has commenced and that more intelligent men are now employed and probably in time. When the guides realize that the warden instead of being his enemy is his friend, and is working for that which will benefit his pocket, he will prove a valuable assistant to the Fish and Game Commissioners.

In conclusion I desire to repeat what I have said before, that in my judgment, if the present game laws are enforced, they are strong enough to protect game and to allow it to increase; but to do this the Commissioners must;

First—Have sufficient funds to carry on and enlarge the good work that they are now doing, and

Second—Interest the guides and secure their co-operation. X.

[We have further a communication from Mr. Jonathan Darling on this type.]

HUNTER'S LUCK.

I SEE from the various reports in your columns that the sportsmen are returning from their trips, and as a matter of interest to all of your readers their experience and successes are being recorded. Let me add my quota:

Mr. H. S. Clark, first teller in the Lincoln National Bank, of this city, who last year had such good luck with caribou, securing two fine heads to his own gun, being anxious to add an elk or big-horn to his fine collection, started with a party under fine auspices for the big game region of Colorado, as we mentioned in a former article in this paper. They went some fifty miles by buckboard and then forty more on horseback and on foot up the mountains beyond civilization to a substantial camp. They report a delightful time in camp, plenty of antelope, some blacktail, and grouse without number, but no elk antlers adorn Harry Clark's dining room this season. They saw several herds of elk (one quite large one), but not a horn among them all; all had been thinned out by market or head hunters. Clark will try it again next season.

Dr. P. W. Levering, Dr. Z. P. Fletcher, John Polhemus and James Earl, of Jersey City, sojourned around Porter's Lake, some fifteen miles up the mountain in Pike county, Pa. They brought back a box of grouse and one of the finest four-year-old does we ever saw, very fat, weighing 168lbs. when paunched. We had some of the steaks and they were delicious. The party were met at Canadensis by Geo. Crane with his double team, who introduced them to Mr. Aug. Rabourdin, of Mount Hope, the hunter and guide of the wilds to be prospected. Mr. Rabourdin is an old French soldier, a man of more than ordinary intelligence, loves the woods and is posted in regard to its localities, and is a very companionable man.

The first day they secured several grouse only. The second day (and how singular things turn out!) Mr. Polhemus owed his lucky shot to tumbling off a log into the river. At the Bushkill River a tree had fallen across, over which the party had crossed in safety with the exception of Mr. Polhemus; for some reason or other when in midstream he lost his equipoise and went over. Dr. Levering rushed back and helped him back on to the frosty log, only to see him go over again; but he finally reached the other shore a very wet and demoralized individual. Hunter Rabourdin, after taking the party up some distance on a ledge that overlooked considerable country, said: "This is a fair runway for deer. I expected to put Levering here and you further on; but as you are so wet, you had better stop here; build a fire and dry yourself, as it may be a couple of hours before we start a deer." Polhemus had got nicely dried, had a good smoke, and was feeling on good terms with himself and mankind in general, when he heard the hound's full tone bearing up the ravine, and a doe came bounding along which he stopped eautifully. Moral: If you want to get the best runway for deer tumble into the brook for it. Don't believe it, and don't want to try it.

The best episode in the whole trip was Doc Levering's bear experience. The guide had come around and posted the different stands that there was a bear in the swamp, and the dog might drive him out by either one of their stands. The guide had with him when he first started out a large black Newfoundland dog, which he kept in leash beside him.

Levering, having eaten his lunch, was taking things coolly when he happened to look over toward a large rock some 40 or 50yds. away, when he saw the guide's black dog stick his head above the rock, his paws in front, gazing at him. Levering with his Winchester at his shoulder, his elbow on his knee, took deliberate sight between the eyes of the dog, saying to himself, "Oh, if you were only the bear, how I would spoil those eyes!" The dog dropped back out of sight. Soon the hound came bellowing along that way; then the guide followed. "Didn't you see anything of the bear?" "No," says the Doctor, "I saw your black dog over there by that rock." "Why, my dog has been with me all the time." On investigation the mark of the bear's paws with the black muck from the swamp was plainly discernible on the rock. Levering don't like to hear this story told, but then you know, history is history. He says it is bosh, that he knows the difference between a dog's and a bear's ears.

Richard Dyne, of Jersey City, has just returned from Pike county. He went for grouse. Dyne is, we think, one of the best if not the best brush shot (for grouse especially) in the whole State of New Jersey; and we will not bar Jack Brewer, Sam Castle, Big Terrell, or any one else. We got the cartridges for Dick. He said he wanted no boy popguns; that when he went for grouse in the brush he wanted something that he could depend upon to kill. We got him from Squires some Winchester reinforced-base shells, loaded with 3¼drs. Walsrode and No. 7 chilled shot. Dick expected to bring back from fifty to 100 grouse, but alas! upon arriving at the grounds up the mountain (they drove some twenty-five miles from the railroad) they found miles of the best hunting ground a blackened waste. Some fool hunter had carelessly or intentionally fired the forest, and of course the birds had left. They only put up nine, eight of which they secured. In the swamp where the fire had not reached they found a few woodcock, and knocked over a half dozen of what Dick calls jack rabbits (big fellows). They were, we suspect, the northern hare (*Lepus articus*), as we have no jack rabbits wild around here.

Dick made a double shot which is worth recording. He had followed a big cock grouse some distance, the wary bird not lying for the dog, but getting up with a whir beyond shot range, but at each rise lying closer. At last Dick marked it down to a nicety and his dog drew and then came to a stand; the bird got up and was promptly knocked over, when to Dick's amazement at the crack of the gun a buck deer sprang up and bounded off, giving him a fair side view, some 20 or 25yds. distance. Dick is always cool and he held for just back of the shoulder and down came the animal, a spikehorn buck, the No. 7 chilled cutting the heart in two, and the shot going through the body even to the skin in the opposite side. The deer weighed 158lbs. when dressed. Dick has great faith in Walsrode powder for penetration.

And lastly, as to your subscriber, who essayed to try the swales of Dutchess county, where he had such sport last fall, an account of which appeared in your paper. We were met at the depot by Coz Will Boardman. After supper we were heartily received by the boys at Numan's, the sportsmen's headquarters of that region. They thought there were some birds around. We were much disappointed to learn that we could not secure the services of Jack Fitzpatrick, who was engaged night and day running the engine of a cidar mill in the neighborhood. This is a great year for apples, and it did seem too bad to see thousands and thousands of bushels rotting on the ground; it would not pay to gather and barrel them for market. This cider mill, with a 15 horse-power engine, would cider up from 100 to 250 bushels of apples in a day. Connected with the mill was an "evaporator" they called it—a commodious house where apples were pared, cored, sliced and dried with the aid of some half dozen bright-eyed lassies and as many boys. We regret that we have lost our notes, but we thought at the time it was all very interesting, if not really connected with sport. But then, you know, sweet cider is awful good.

Bright and early, with Mike Fitzpatrick (Switzer, the boys call him) and his dog Cute, we climbed the hills. We found the birds few and very wild; would not lie to a dog until after having been put up several times; and it was hard work climbing those ledges. Mike didn't seem to mind it a bit, but Jacobstaff's three-score years and five told on him after the first few hours, and he was glad to take to the squirrel woods, where he had some good old-fashioned sport with the bushy tails. They are quite plenty around there this year and they make an elegant pie; beat a hare or rabbit all hollow.

The next day Mr. W. H. Bartlett, ex-Sheriff of the county, and one of the proprietors of the Amenia brick yard, very kindly took us in his buggy up the mountain some eight miles to the gold mine recently discovered, and from which good things are expected. The shaft is now sunk some 150ft. (116 perpendicularly), and they expect to strike the mother vein of rich gold-bearing quartz at about 300ft. The ore that they are taking out now contains, among other things, iron pyrites and what they call arsenical gold, assaying from $10 to $60 a ton, averaging so far about $27 per ton. We lost all our notes during the excitement of the election and regret we cannot recall the very lucid explanation given us of ore veins, etc., by the practical miner, an experienced man from Denver, sent for by the company. He has great hopes of the future development of gold in Dutchess county, as several of the farmers have, as claims are being made and staked out; but all are waiting for this first experiment.

Among our trophies bagged by Jacobstaff was a big black woodchuck. We wished we had him home, for we recall that in our boyhood days baked woodchuck was not bad. But Cousin Kate didn't seem anxious to cook the animal and Coz Will didn't urge the matter very hard, so we presented it to friend Numan, which I don't believe he really appreciated either.

Well, we had a good visit, made some desirable friends and got some game, not much; but, as Shakespeare says of the wound, "Not as deep as a well or as wide as a door but will do," or words to that effect; and so ends trip second to Amenia.

What capital articles Fred Mather is giving us! His notes on trapper life are graphic and to the life; we know, having been there, and his article on Chas. H. Raymond, whom no one knows but to love, was peculiarly felicitous. I trust he will keep up the series down to modern days, when we can recognize familiar faces in his splendid portraits—Gen. Arthur and others. JACOBSTAFF.

PROTECTION IN ALABAMA.

BIRMINGHAM, Ala., Nov. 14.—*Editor Forest and Stream:* Last night in the Commercial Club a number of well-known gentlemen of this city gathered pursuant to a call, and steps of an initial nature were taken to have laws drafted and carried out, whereby the fish and game of this State will be better protected. Mr. H. K. Milner was elected temporary chairman, and Mr. John B. Rosenstihl temporary secretary. The chairman stated the object of the meeting, and the matter was discussed with an earnestness which indicated success.

On motion of Dr. J. H. Allen, a committee of five was appointed to draft general laws and plans whereby they might be carried out, looking to the preservation of fish and game in the State. They were Dr. J. H. Allen, Judge W. W. Wilkerson, H. Perry, J. T. Glover and Dr. Alf Eubanks.

On motion of Dr. Allen the chair appointed as a committee of three to request the press of the State to let the citizens know of the meeting, its objects, etc., and to add a request that all in sympathy with the movement signify their willingness to participate in it by communicating with the secretary, Hon. F. P. O'Brien and W. A. Porter and Dr. George Eubanks.

Major W. J. Milner moved a committee of three, the chair included, be appointed to draft suitable constitution and by-laws and report permanent officers to a subsequent meeting. The chairman named T. T. Ashford, Dr. R. G. Jones and himself as the committee.

The meeting adjourned subject to call.

We are very much in earnest over this question. Our State is in a deplorable state in regard to its game; in brief it is virtually without protection, as there is no officer whose duty it is to look to the enforcement of the laws now in existence, and one citizen will not inform against another for many personal reasons. Hence the old axiom holds good, "What is every one's business is no one's." The sentiment is such that I don't think it possible to create officers for the special purpose of game protection and pay these officers out of the State fund as it now stands, and we would be sure to raise a howl if it should be tried to raise this fund by ever so slight an increase. I can see but one way, which is to make these dual. Invest the Commissioner of Agriculture with State wardenship, and one constable in every beat with the office of deputy warden; these to be paid only a nominal salary by the State and half of the fine through any conviction they bring about. J. H. ALLEN, Chair. Com.

THE .30CAL. SMOKELESS HUNTING RIFLE.

Editor Forest and Stream:

The newspapers lately have with their customary acumen discovered a chance for a sensation in the exploitation of the dangers of the small-bore smokeless powder rifle as used by hunters.

I confess that I should not care to hunt on the Long Island deer grounds with such rifles in use, but for that matter there is no pleasure in hunting there anyhow. Under ordinary hunting conditions, however, I do not believe that the use of the small bores adds greatly to the dangers of the woods, and given an equal number of hunters I doubt if it actually makes any difference as far as danger to human life is concerned whether they be armed with the small bores or black powder rifles, or for that matter shotguns loaded with buckshot. Theoretically it can no doubt be satisfactorily proved that the .30cals. are 50 or 100 per cent. more dangerous than the other guns, but then expert arguers have frequently proved that this same rifle has no killing power at all, and that, as was actually stated, a man can "walk off with seven bullets through his body."

If seven bullets didn't phase the man whose body received them, one bullet would be a trifle hardly worth noticing. But such argument is of course foolish, and as an actual fact a single .30cal. bullet at ordinary ranges kills a man as dead as one of Zalinsky's dynamite guns.

It never settles any question to debate upon it, and practical experience is the only final court of appeal. The small-bore rifles are winning many advocates among hunters, and I have yet to learn of anyone who has been accidentally killed by a rifle of this character at long range.

Following the line of argument adopted by those who condemn on this score the small bores, it would naturally appear that long range rifles of any pattern are vastly more dangerous to human life than short range rifles, and that both are more dangerous than shotguns. This is theoretically unanswerable, but to descend to actual fact, how many men are accidentally killed at long range? Can a single instance be mentioned aside from accidents occurring in rifle ranges? Then consider the number of men killed each hunting season with buckshot and you will acknowledge that the shotgun is actually the most dangerous weapon of the two. By the most dangerous weapon I do not mean "theoretically most dangerous." The ghosts that our nurses used to scare us with were to us theoretically more dangerous than the buzz saws that our infant fingers monkeyed with; when I say most dangerous I mean the guns that actually kill people, not the guns that scare them when they read about them in the papers.

My wife read one of the sensational articles the other day and said:

"John, I don't want you to go on that hunting trip. I am afraid you will be killed by one of those guns that carry four miles and a half."

"Don't you worry, my dear," I replied. "Every man who has been killed where I am going has been shot with buckshot."

If I had wanted to still further allay her fears I might have added that hunters in wooded countries are never killed by stray bullets at long range. Whether they are hit by rifle or shotgun it is always at short range, and in

nine cases out of ten by men who aim to kill, imagining that they are shooting at four-footed game.

These newspaper alarmists gravely affirm that the range (and when they say range they apparently refer to point blank range) of the small-bore smokeless powder rifles is four and a half miles.

As a matter of fact the extreme range is about 4,000yds., or two and one-third miles. This great range, however, is only obtained by elevating the muzzle of the rifle at an angle of 45°; and owing to the resistance of the atmosphere and light weight of the bullet, which soon loses its velocity, the bullet strikes the ground almost vertically, the fall being much more rapid at the latter part of its trajectory than at the start. It then has a striking force about equal to that of a spent bullet fired by a .32-20 rifle, which is very trifling.

But as a matter of fact very little big game is shot at in trees or on any rise that would necessitate such an elevation, and firing point blank over level ground without obstructions the bullet would not be apt to go more than 200yds. Accordingly the statements of Mr. Johnson and W. W. Leonard (I wonder if he is the man of the bullet-proof coat) that there is danger to human life at a distance of three miles from the firing point is unqualifiedly absurd; as absurd, in fact, as if they should assert that the guns with steel-jacketed bullets—which, by the way, are of no earthly use for hunting—would shoot through three miles of standing timber. And some of their remarks seem to admit of such a construction.

Steel-jacketed bullets should never be used in hunting, in the first place because they do not have the stopping powers of the soft-nosed bullets except within limitations; and also because in a flat, open country, such as some of the antelope ranges, they would ricochet and would actually prove dangerous. The lead soft-nosed bullet is not open to this objection, and in a wooded country neither bullet will go a rod further than the ordinary bullets fired by ordinary hunting rifles.

Aside from antelope, there is practically no game in the United States to-day that is commonly hunted with rifles in a flat, open country.

In a mountainous country bullets are stopped by the ground within very short distances of the game at which they were fired. And similarly in a wooded country the flight of the bullet is checked by the trees around or behind the game. When shooting in a wooded country I have sometimes hunted up my bullets for one reason or another, and I always found them within a few rods of the point where the game stood. Of course there are cases where bullets will travel long distances without bringing up, as along lakes or streams; but a stray bullet has a big piece of the atmosphere in which to seek a resting spot, and the chances are that it will not find a place in a human being. Just for the sake of theorizing a little, there are about 28,000,000 square feet in a square mile, and the chances of a bullet fired at random by a man within that square mile hitting another man situated say half a mile from him are proportionately infinitesimal.

Any kind of gun is dangerous under certain conditions. Rifles are not adapted for hunting near cities. Where large game is killed, however, they become a necessity. Here the smokeless powder rifle has its proper sphere, and its use is not to be condemned simply because it has a flatter trajectory than the black powder guns, and a greater striking power than any other gun of similar caliber.

The small-bore smokeless powder rifle has decided advantages in several respects over any of the black powder rifles. Some of these advantages, such as freedom from smoke and fouling, and flatness of trajectory, are well known and admitted. Some of the more important points of superiority are, however, frequently overlooked. The two distinctive advantages possessed by this class of weapon are, first, the high velocity secured at ordinary hunting ranges, and secondly the greatly reduced recoil.

The first of these permits the use of a much smaller bullet for effective killing of game, and the second the use of a lighter gun. Weight of metal is no longer necessary, as it is in black powder rifles, to compensate for the excessive recoil of a charge sufficient to kill big game.

As an instance in point it may be stated that I shoot a .30-30 smokeless weighing but 6lbs., which has not one-quarter the recoil of my last black powder rifle, a .40-82 weighing 9½lbs. I not only save a great deal in the matter of weight, having a gun easier to carry and easier to shoot where quick shots are necessary, but I also can kill cleaner with it because I am not afraid the tang sight will take out one of my eyes at the moment of recoil. I have never shot more than 90grs. of black powder, and I have no wish to try 140, which some of the black powder exponents seem to think necessary.

To return to the first point, namely, that the high velocity of the full-strength smokeless powder permits the use of a smaller bullet than can be effectively used with black powder. The stopping power of a bullet depends to a considerable degree upon its velocity. A .22 short will frequently pass through a squirrel without killing it. The .22 long rifle, however, with increased velocity, kills cleanly in most cases.

Take all the powder but a few grains out of a .45 90 shell and shoot a partridge with it. The bird will not be torn; but shoot the same bird with the standard cartridge and little will remain besides the feathers. Of course these are rudimentary principles, and every rifleman knows them.

Now turn to the .30cal. rifle. Load the shell with black powder and the steel bullet, and try the result. The effect will be less than if a .32-40 black powder rifle was used. Replace the black powder with the regular smokeless load, which doubles the velocity, still using the steel bullet. At short ranges, if bones or anything offering great resistance are struck, the effect will be exactly as if an explosive ball had been used, and the wound will be a shocking one. When the Cubans were using similar ammunition at short range the Spaniards thought they were firing balls filled with fulminate, and their surgeons reported that they had never seen such wounds.

But try the steel bullet at longer ranges, where it has lost something of its initial velocity and settled to a regular flight without the buzz-saw motion that it first possessed, and the small, cleanly punched holes so frequently mentioned will result.

Now make a still further change. Load the ammunition with a soft-nosed bullet, in which the steel jacket covers not more at most than that part of the bullet where it bears on the rifling, and try the effect. This ball expands when it first strikes the game, and imparts to what is hit the whole force of the tremendous velocity behind it as well as its tremendous rotary force. The bullet where it passes out on the other side frequently makes a hole that a man could put his hand and arm in. As Ira Dodge expresses it, when the inwards are taken out of an animal struck by this bullet "you can see daylight through."

One reason why we see so many conflicting statements about these small bores is that unsuitable bullets have been used. Frequently steel bullets have been tried, with the result that little shock was imparted in most cases, while once in a while a terrible wound would result. (These latter were always at short ranges.) Later, before our own cartridge companies began loading the ammunition on a large scale, cartridges used on tough-skinned animals in India or Africa were tried. These had a hollow in the front end filled with wax, and were not suitable for our game because they passed through too easily and required too much to make them expand.

The ammunition as loaded by our American companies at present seems to have obviated this difficulty so that the great velocity of the bullet's flight is fully utilized, and imparts a shock to the game that is hit fully as great as most of the black powder hunting rifles now in use.

I would not have taken up so much space in writing about this matter but for the fact that I see so much plausible nonsense printed on the other side of the question, apparently written by men who never saw one of the guns they condemn.

Take, for instance, the case where a correspondent argued that the rifle lacked accuracy. He based his statements on the tests of the New York Board for the Selection of a Militia Arm, and gravely quoted results obtained on the target in a test of rapidity of fire, as though they had been made for accuracy. His deductions from his false premises were that the gun was inferior in the point of accuracy to any black powder rifle. Later he must have discovered his mistake, for one of the rifles criticised won an unusual showing of prizes at Sea Girt in competition with black powder rifles fired by some of the finest marksmen in the country, but he failed to come to the scratch and acknowledge his mistake.

There are undoubtedly better hunting rifles for certain uses than the new small bores, and guns that will kill more surely, but for a gun that I am willing to carry and shoot the .30cal. is away ahead of anything I have seen.

J. B. B.

Editor Forest and Stream:

In your last issue I notice a statement signed .44, toward the close of which the writer affirms that the modern small-bore smokeless powder rifle is n. g. for game shooting. In support of his theory he says that Gen. Flagler in the ordnance report shows that the steel-jacketed bullet has no stopping power as compared with the .45cal. Springfield rifle, and that the soft-nosed bullet lacks accuracy. Therefore, the writer argues, the gun is not a desirable hunting weapon, lacking the deadliness of the larger calibers.

Judging from these remarks, it is safe to assume that the writer has not seen Gen. Flagler's report, but bases his remarks upon some newspaper summary. He falls into the error, which is common with those who have had no practical experience with the arm in question, of assuming that because the rifle with steel-jacketed bullet lacks stopping power at long ranges, this also applies to short ranges, including the distances at which game is commonly killed. In this he is mistaken, for Gen. Flagler expressly acknowledges the great tearing qualities of this bullet at short ranges, specifically mentioning its well-known "explosive effects." It is only at mid range and long distance shooting, which in the army means a great deal more than the same terms applied to the hunting world, that the cartridge and weapon are found to lack stopping power. And it was for these ranges that the army experiments with soft-nosed bullets were made. The half mantled bullets were found to have ample stopping power at any range, but conversely they lacked penetration, and were useless for dislodging troops behind fortifications, and for this reason it was deemed better to stick to the full mantled bullet as the standard for service ammunition.

Thus it becomes evident that what is in reality a strong argument in favor of the use of the small-bore smokeless powder rifles for hunting has been perverted to do duty for the other side of the argument.

The fact of the matter is that these small bores, with the soft-nosed bullets—for no one who hunts thinks of using the steel bullets—have a stopping power sufficient for any game on the continent, and tear worse than the larger calibers. It is easy enough to argue theoretically that they are all wrong, but I have noticed that men who take this side of the argument generally change their opinions when they actually come to use the gun.

.30-30.

The Bowley's Quarter Pheasant Poisoner.

BALTIMORE, Nov. 20.—*Editor Forest and Stream:* It will no doubt be interesting to the many readers of the FOREST AND STREAM to know that James T. Butler, charged with poisoning 3,000 English pheasants at Bowley's Quarter Ducking Club, was pronounced guilty and sentenced by Judge Burke, of the Circuit Court of Baltimore county, to three years in the House of Correction. House of Correction sounds rather mild for so diabolical a crime. Let me say to the readers of the FOREST AND STREAM that the House of Correction is the most despised prison we have in Maryland, not excepting the Penitentiary. The treatment is just as severe as in the Penitentiary, and the prisoners are made to work. Under the statutes of Maryland Butler could only be tried for cruelty to animals, which is a misdemeanor. Judge Burke imposed the severest penalty that could be imposed.

GEORGE W. MASSAMORE,
Sec'y-Treas. Maryland G. and F. P. A.

To Whom Does the Guide's Game Belong?

UTICA, N. Y.—It has been my experience in shooting with guides that they considered the game shot as the property of the employer. But some guides I know have two prices for their services. For one price you have all the game shot and for the other you only have what you yourself shoot. If this fact is thoroughly understood when you start out, it makes little difference which plan you follow; in either case you are not apt to get too much game.

MODERATION.

CHICAGO AND THE WEST.

In Old Mississippi.

CHICAGO, Ill., Nov. 6.—Years ago, when I was just starting out in life, I was taught that it was one of the duties of a gentleman never to use in any public way information which he received in his private correspondence. Some years since, however, I gave up the business of being a gentleman, because I found there was nothing in it, and since then as a newspaper man I have used information whenever I got hold of it, this being as I understand it a very cheerful and pleasant way all around, especially since it is all in the FOREST AND STREAM family, where there are no secrets. These words of apology I do not consider strictly necessary as prelude to a good slice stolen out of a letter from Mr. T. A. Divine, of Memphis. Should he object he must remember that to be great is to be public. It seems that Mr. Divine made a visit to his old friend, Capt. Bobo, the bear hunter, and in the absence of the owner went wandering over the place as is the custom of the land. He says:

"I got to thinking that it was on the 25th day of October, 1883, that I met Bobo for the first time, within 200yds. of where his house is now located. I was with an engineering party who were then locating the present Mississippi Valley R. R. Like all good railroad men, we were keeping the Sabbath, when Bobo rode up on a little country-raised horse, with a bear's leg dangling down on either side of his flank. He deposited the bear in our camp, and we sat there together. That was the beginning of the acquaintance of Bobo and Divine, and as I walked over these grounds and looked at the acres in cultivation I couldn't help noting the difference between the present picture and the picture as it was shown to me on that same day nearly fourteen years ago. Where I was walking on that glad October day was a dense thicket of vines and cane, and struggling up through this the most magnificent gum, ash and hickory man ever looked upon. Under this grew grapevines and muscadime vines festooned from tree to tree. There was no sound save the woodpecker's tune on the dead limb above us, and the sigh of the great swamp. To-day these trees and vines have all gone, and in their stead is growing the most magnificent corn, cotton, potatoes, barley, rye and wheat that one ever saw.

"I stood on the eastern end of his house and gave one blast of the horn, and Jas. Fitz. James may not have been more surprised at the response which greeted the whistle of Bob Roy than I was when from the gardens came and greeted me about 100 tried and true bear dogs. This was a singular picture; the garden overgrown with beautiful roses, neglected so much as to leave the ground covered with soft grass, in which the hounds were lazily enjoying themselves, waiting for the sound of the horn they know so well.

"Bobo returned at night and we talked over the various things of our lives, the many changes that had taken place, and spoke particularly of you and Money. You know, Noel Money sent Bobo several fine English hounds. Among the lot were some young puppies, two of which died before they were christened. The others' names were respectively Hough, Money, Foster and Divine. Dear me! I wish you could see Hough and Foster! They may be fine hounds, but they are the sorriest looking ones I ever saw; and somehow I consoled myself with the fact that the one named for me had died, and I feel sure that Money will be glad to know that the one which was named for him went mad and had to be killed. Foster, like the man he was named for, seems to be willing to do a great deal of sleeping, and when he was called up by the blast of the horn he put down one leg and carried three, or tried to do it. Bobo says that Hough is a very fine dog! The following dogs of this pack which you knew are still there: Bad Eye, Good Boy, Ball, Jolly, Fly, Ronco, Dan, Dollar, Ben and Alcorn. Strange to say, Alcorn's jaw is entirely well and he is able to go in the chase as good as ever. In fact, in a big bear fight which they had last week, where they killed a 400-lb. bear, Bobo tells me that Alcorn showed himself to be as good as ever he was in his life. (Alcorn is the dog that had his jaw shot off last year in our bear hunt.)

"'Bill Bobo,' our colored hunter, is here. Bill has more clothes than a New York dude, of various colors and fit, because they comprise a part of yours, mine and Money's wardrobes. The next morning Bobo and myself concluded to have a little drive for deer, and as I was not prepared with hunting clothes, I asked Bill if he couldn't fix me up. He said he had a pair of breeches belonging to Mr. Money. I said, 'Well, Money's pants fit me exactly, except the legs are too long.' He said, 'By Gad, sir, they are knee breeches.' I told him to bring them in, and they were fine white English corduroy knee pants, that fitted me to a T, full length, and Bob Bobo was unkind enough to say to Bill, 'Negro, you had better watch your pants or that fellow will take them home with him,' and Bill laughed his great horse laugh and said, 'That's what they said he wanted to do with Mr. Money's buckskin pants.'

"All this comes, you know, from bad association. In fact, between you and Money, I have very little reputation for veracity left; but thank God! there are millions of people who do not read your articles and do not follow your footsteps.

"James Whitcomb Riley makes one of his characters somewhere say, 'I just like to go in the kitchen and sit by the fire and see them make batter cakes, like your mother used to make them—it rests you so!' That thing kept running through my head all day. 'Great God, we thank Thee for this beauteous land, this birthright of the free,' where we can just go right out in the country, sit on the kitchen stool and watch Lula make cakes, and Lord! how it rests you, how it rests the heart, after the cramped streets of the city. Your heart throbs with a new vigor, and your mind is fresh. Excuse me, I am only trying to make you feel badly.

"Come and see us. We are with you, like all true Mississippians, whether you are right or wrong, and I want to say that if you do not come to Bobo's this fall you are an ingrate of ingrates. Come down here in December, and we will go up to Dr. Taylor's and shoot a day or two, and then go to Bobo's and kill a bear. Easy, nice work, and the music of the hounds will make you a young boy again.

"Irby Bennett will be here Sunday. On the 20th he leaves for New Haven for good. Too bad! I am ruined. Such a companion I will never have again.

"On Nov. 20 the following go into camp twenty miles west of Canton, Miss., for a week's bird hunt: Dr. John E. Owens, of Chicago; Mr. James, of Maryland; Gen. Fred Myles, of New Orleans; Mr. E. Hough, Chicago; Mr. J. M. Aldrich, Michigan City, Miss.; Mr. R. W. Foster, New Orleans; Mr. L. J. Lockwood, Memphis, and T. A. Divine, Memphis. I wish Roll Organ would come. Tell him to steal off."

Now, the odd part about the above letter is that before I had finished my thefts from it there came into my office the writer himself! It snowed yesterday in Chicago, but immediately on Tom Divine's arrival the snow began to melt in front of his beaming smile, and at this time is entirely gone in the vicinity of the city. Mr. Divine says that quail shooting has begun in his State of Tennessee, and that last week he and a friend had a nice day's sport. The birds were full grown and strong of wing. He reports that Capt. Bobo is now absent on a two weeks' bear hunt further down in Mississippi. Mr. Divine promised to send up large quantities of venison, wild turkey and quail for the Thanksgiving dinners of his Chicago friends. He insists that the camp hunt mentioned in his letter is going to be the most pleasant affair which he and his friend Foster have ever pulled off. There will be no shooting at all, except on quail (called in the South partridges), and a daily limit will be put on each man's gun, so that the camp will not be over-supplied with birds at any time. It would be hard to devise a more pleasant or sportsmanlike way of passing a week than these gentlemen will have. Mr. Divine is in Chicago on hurried business, but will remain here a couple of days until he has melted all the snow off the upper portion of Illinois.

CHICAGO, Ill., Nov. 14.—The tarpon fishing on the Texas Gulf coast, near Aransas Pass, has this fall been exceptionally good. The fame of this new tarpon locality has gone swiftly abroad since it was first called to the attention of the angling public in the columns of FOREST AND STREAM. Hundreds of anglers have come from all parts of the country to enjoy the sport of tarpon fishing, and so great has been the demand upon the supply of tarpon that it has been thought necessary to take early steps for protecting the fish against the too ardent anglers. It is asserted that over 400 tarpon have been taken in Aransas Pass waters this season. One party in a few days killed forty-two tarpon. These Texas fish are gamy as any of their kind, and it is estimated that not one fish is brought to boat out of every ten hooked. The Aransas Pass Railway Company is making consistent efforts to bring this Texas coast country into popularity among the sportsmen of the United States, and it would be very wise of the management of this road to aid in all ways in its power every protective effort which shall look to a conservation of the sporting riches of this wonderful country. The railroads of this country have destroyed the game. Yet the railroads of the country are able to preserve the game to a greater extent than any other one agency if they cared to do so. It would seem an easy proposition that a species of traffic enduring for twenty years is of more value to a railroad than a trifle heavier traffic lasting only four or five years. It is presumptuous to undertake to tell another man how to run his own business, and I do not recall that the personal opinions of one man ever changed the business policy of a railroad company. Yet for one who has seen the havoc in Northern game and fish in the recent past the prospect is not a pleasant one of the havoc which will be wrought upon the game and fish of the South in the early future.

Death in the Water.

Jack Paynter, a trapper plying his vocation on the waters of Lake Koshkonong last week, had the misfortune to capsize his boat, and was unable to get ashore. He clung to the overturned boat for over an hour, and his cries were heard by another trapper, who paid no attention to them. Some members of the Blackhawk Shooting Club finally pulled Paynter out of the water in a frozen and exhausted condition, but he died soon after they got him to the club house.

Dove Slaughter in the South.

The daily papers of the South are beginning to agitate the question of action against the senseless and beastly butchery of doves indulged in by some shooters whose ammunition credit is greater than their store of brains. From a daily paper in Chicago I take the following:

"In a recent interview Judge Fish, of the Southwestern Georgia Circuit, expressed the hope that the Legislature at the present session would do something to protect doves from indiscriminate slaughter. Judge Fish has called attention to an abuse which demands immediate attention. He tells of one party which killed 12,000 doves in a few days last season. On the day after this slaughter the negroes picked up in the vicinity over 300 doves which had been wounded and died near the baited field in which they were shot. In South Georgia fields are frequently baited, and when great droves of doves get used to feeding in them it is easy for a few hunters to kill thousands of them. Many of the birds thus slaughtered are left on the ground. A rivalry has grown up among those who indulge in this cruel business. Single hunters have been known to kill 500 in a day."

Milwaukee Hunters.

A number of Milwaukee sportsmen met at No. 701 Chestnut street this week to talk over protective matters, and a little society was organized for the purpose of protecting hunting dogs. The Wisconsin Legislature will be memorialized to this effect by the sportsmen. A bill will also be introduced prohibiting the use of ferrets in rabbit hunting. The wiping out of the Wisconsin game laws for 1895 gives the sportsmen of that State a grand opportunity to frame a model game law. They have in plain view all the mistakes in the game statutes of other States, and moreover have the benefit of the most modern enlightenment in protective matters. Certainly the new Wisconsin law, whatever it shall be, should abolish all spring shooting whatever, and should prohibit absolutely the sale of game at any season. These two measures alone, if enforced, would insure a splendid permanancy in the Wisconsin game supply, which is one of the most considerable in the entire West.

Ducks.

Mr. A. C. Patterson and his friend, Mr. Lamphere, on last Tuesday and Wednesday, at the Calumet Heights Club, had the great good fortune to meet the south-bound flight of fowl, and made the tidy bag of sixty-five ducks between them; certainly a very satisfactory showing, since the shooting was less than thirty miles from the Chicago post office and main store.

On Tuesday word was wired from the Lauderdale lakes, of Wisconsin, that the ducks were there in thousands, and several parties departed for that point or others of that vicinity. At Koshkonong Lake on Monday it was thought the birds were leaving for the South, as the weather was very cold and ice was forming. It is possible that some of the Koshkonong birds had dropped into this series of waters, the first below Koshkonong; but no doubt the bulk of the flight there was made of birds fresh down from the further North, part of which dropped also into Koshkonong. It seems now sure that the birds are all in this latitude or south of here, and that they are scattered from here to Arkansas and Texas. I should look for heavy shooting on the Texas waters within the next week following.

Dogs.

This week Chicago had a little fire out in the packing house district, in which the gallant firemen showed their skill and their humanity alike by saving the lives of five creatures, not human beings, but dogs. These dogs belonged to the owner of the building, and had been imprisoned in the house by the swift spread of the flames. All of the dogs were overcome by the smoke, and were carried out by the firemen in their arms and later revived after patient effort, *à la* heroine in the novel. A singular part of the story is that the entire building and also neighboring ones would have been destroyed but for these same dogs, which attracted attention by their barking, and so led a neighbor to turn in an alarm. The dog is man's best friend.

Quail.

Mr. E. H. Bisby, of Deer Park, Tex., a very successful and practical handler of shooting dogs, writes to Mr. Wm. Werner, of this city, for whom he has been training some dogs, to the effect that Mr. Werner would do well to pack his grip sack and come to Texas for a quail shoot. He says: "I will show you more quail than you ever dreamed of, and the greatest duck shooting in America, not 1,000 miles away from where I am. At times there are thousands of snipe. To show you how abundant the quail are I would say that yesterday I found with four young puppies twenty-nine different bevies of quail within a mile of my house. Come down and have a Christmas hunt." If Mr. Bisby can get Mr. Werner down into that promised land I can assure them both that they will both be glad of the trip and the meeting.

Mr. Bisby, by the way, mentions the fact that he lately had a young puppy bitten by a moccasin snake, one of the Southern poisonous snakes. He states that the swelling was severe for about two hours, and that the dog then got better, and never stopped hunting at all.

Deer.

Messrs. John Densmore and John Henry, of Tomak, Wis., two weeks ago killed near City Point, Wis., a deer which is thought to be one of the largest of the season. It was a fine buck, weighing 263lbs.

Leopard.

Sportsmen who attended the Sportsmen's Exposition two years ago, and who of course saw the FOREST AND STREAM exhibit there, may perhaps remember the fine specimen of taxidermist work shown in the mounted deer head known as the "Challenge." This was the work of one of the very best of the Western taxidermists, Mr. Carl Akeley, at that time of Milwaukee. Mr. Akeley afterward came to Chicago—where all good people go after they die, if they are not happy enough to get there before that time—and became the taxidermist for the great Field Columbian Museum. He was with the African expedition of that concern, which within the year went to the Dark Continent for a complete set of specimens of the African big game. Of all this we are to have a story, but I cannot refrain from mentioning a little adventure which a current Milwaukee paper mentions as having befallen Mr. Akeley during his African trip. It seems he was out hunting one day with a native hunter, and while taking a rest under a guava tree heard a rustle in the underbrush and the next moment saw a leopard in the act of springing upon him. Quick as a flash he fired his rifle, but only wounded the beast in one of its hindlegs. The next moment the hunter and the beast were engaged in a death struggle, Akeley finally coming out victorious by simply strangling the animal to death, though the leopard lacerated Akeley's arm with his teeth.

Change.

Mr. H. B. Jewell, mayor of the pleasant little city of Wabasha, Minn., writes as follows in regard to the change of habits sometimes shown by wildfowl of late years. Mr. Jewell is a close observer of the habits of birds and what he says has interest. I recall also in this connection a mention I made some years ago at the instance of a member of the Nee-pee-nauk Club, of Wisconsin, who said that the shooters on Puckaway Lake were confident that the mallard ducks there had so far changed their habits as to cease to a great extent their usual feeding system on the marshes, and to take to the open water, where they could not be disturbed. This gentleman said that the mallards of those waters would dive in 3 or 4ft. of water like the deep-water ducks. Of course all shooters know that the mallard is not a diving bird by natural habit, usually feeding in water shallow enough to allow the bird to reach its food by simply plunging its head and neck under water, and never diving unless wounded or closely cornered, or when its wings are frozen fast so that it cannot rise quickly. As to his mallards Mr. Jewell says:

"Your mention in a late number of FOREST AND STREAM about mallards changing their habits is true. I have been noticing it for several years back. They roost daytimes on sand bars and other exposed or inaccessible places, and fly in to the feeding places after dark, and the first gun in the morning scares them out, and they don't come back until night. Duck shooting has been very poor in the Mississippi Valley this fall."

Out.

There are some deluded folk who train up their children, or try to train them up, in the belief that there is no such thing as luck, whereas even a common gambler knows better than that. If there were nothing in luck, I should be pleased to know why it is that I am always in my office when the crippled beggars, and match peddlers, and widows with seven children, and life insurance people, and Salvation Army girls peddling the *War Cry*, and also hobos just in need of a plain drink happen along, and how I always manage to be out of it at the time when good people—for instance, like Harvey McMurchy, of the Hunter Arms Co., whose card I find on my desk just now—chance to come in. I am sure Mr. McMurchy does not classify under any of the above heads, and therefore I should have been glad to see him. Or I should have been glad anyhow, without any therefore. There is something in luck.

E. HOUGH.

1206 BOYCE BUILDING, Chicago.

HOW THE NEW JERSEY LAW WORKS.

TURNERVILLE, Gloucester County, N. J.—I wish to say a few words in condemnation of the New Jersey game law. As it is to-day it will only be a few years when the game will be a thing of the past. What we want and what is needed is a uniform law. I have noticed in the beginning of August and September quite an increase of quail and rabbits; but the season coming in for gray squirrels and pheasants has given all a chance to roam the woods and fields with dog and gun; and all kinds of game birds have been shot. Rabbits have been killed by parties coming from Philadelphia on Sunday with their dogs, as many as a dozen after one little rabbit. This happens almost every Sunday; and not only these, but others from Grenloch and Turnerville. Box traps have been set along the swamps and springs a month back by people who pay rent for a farm and say they have a right to set them. A deputy should be appointed to look after this part of Gloucester county, and also Camden county. Yesterday I could hear the hounds running and the report of the gun. It is not the people who live here, but people who come here and think they have a right to do as they like when they get in the country.

Again, all this summer dogs have been running at large and eating up the young rabbits.

The laws should open for all kinds at once, at then no one would have a right to go out with his gun before. Again, the season opening, as it does this year, ten days after the Pennsylvania law, gives them a chance to kill off their own game and then flock across the river and slaughter what is left of ours after the pot-hunter has had his share. I hope the law will be changed this coming winter so it will help some of these evils. It is the same way with trout, bass and pike.

S.

[You should communicate your information of game law violations to Fish and Game Protector Chas. A. Shriner, Paterson, N. J.]

Carp and the Tolleston Marsh.

Editor Forest and Stream:

The Tolleston Club, of Chicago, of which I am a member, has a most admirable natural duck marsh containing about 2,500 acres near the town of Tolleston, Lake county, Ind. Up to within a few years there has been on this marsh an exceedingly rank and heavy growth of wild rice and other natural food for all varieties of ducks. Unfortunately by some means carp have gotten into it and have nearly ruined the feed, having eaten out all of the wild rice, wild celery and much of the smart weed. They grow to an enormous size, and have increased in numbers to an incredible degree.

The Little Calumet River runs through this marsh, and when the water is low the river seems to be absolutely full of them. When the water is high they spread over the marsh and eat everything that comes in their way. I write this in the hope that it may lead to some information as to the best means of getting rid of them. They are a nuisance of the worst possible description, and if every carp in the United States could be annihilated it would be a matter of congratulation to everyone who is fond of shooting. I have heard of their destroying other marshes as they have ours, and it seems to me that there ought to be some method of exterminating them.

I have been a subscriber to FOREST AND STREAM for several years, and hope that I am not asking too much in requesting information on the above subject.

EDWIN T. DANIELS.

[We can suggest no remedy, for no practicable method of exterminating carp has been devised except in ponds or streams which it is possible to drain off, when the fish can be pitchforked out, or in private waters, where they may be limed. A marsh such as that of the Tolleston Club, with a river flowing through it, is at the mercy of these water vermin.]

As Many Hunters as Ducks.

WALKER, Ia.—I have been on a shooting trip through Iowa, Minnesota and Dakota. Game in these States is not what it used to be. Many of the small lakes and sloughs are dry on account of dry seasons. Another great drawback in the game country is that there are so many hunters. I have been at several lakes where hunters were as thick as the ducks, one especially, Lake Geneva, in southern Minnesota; at a narrow place in the lake there were upward of fifteen tents of campers, and the shooting in the morning and at night sounded like the rattle of musketry when a flock showed that way. Hunters say that the supply is steadily decreasing.

K.

A Maine Ruffed Grouse Dearth.

BREWER, Me.—In over fifty years of gunning I have never known ruffed grouse so scarce over so large a part of our State. Sometimes they are locally scarce, but this season the same reports come in from everywhere. It takes extra luck for a man and dog to average one a day and more than three-quarters are old birds. We never had any snaring here, and no market gunning worth mentioning. Hawks and owls are also always scarce near here.

M. H.

Michigan Partridge Shooting.

SAGINAW, Mich., Nov. 11.—The partridge shooting is fine around Saginaw. I have been out three times since the season opened, Nov. 1, hunting a day or part of a day each time, and have brought in just thirty birds, averaging about ten for each trip. Not bad, is it? Besides, the bag has been sweetened up with half as many quail.

Our Dakota trip was a grand success; more birds than I have seen before in years. We had splendid goose shooting, and any quantity of ducks to be had for the asking.

W. B. MERSHON,

Proposed New York Game Sale Seasons.

Editor Forest and Stream:

THE New York (city) Association for the Protection of Game have met with the president of the Marketmen's Association and have drafted a law to suit both parties. The main features are: Leaving the seasons of killing game as at present; extending the season for having quail, grouse, woodcock, venison, rabbits and hares and squirrels until March 1; permitting sale of plover and bay birds all the year; of wildfowl from Sept. 1 to April 1; and sale of quail in addition during the month of October. All possession after the closing of the open season to require proof of lawful killing during the open season or without the State. The restricting of the spring wildfowl selling to April 1 is a gain of a month, if the open season can be restricted also, as it should be. The marketing of qual in October, in my opinion, ought to be followed by permitting the shooting within the State from Oct. 1 to Dec. 31, otherwise our birds will be killed and marketed before lawful sportsmen can go after them. The repeal of Section 249 is what we get for these concessions, and I think it a decided step in the right direction. It will be a great gain to have the marketmen with us. MANHATTAN.

A Justice of the Peace who Breaks the Law.

EAST HAMPTON, N. Y., Nov. 12.—*Editor Forest and Stream:* May I ask if it is legal to ship quail, partridges, rabbits, gray squirrels, etc., from here to parties in New York city. Game such as above is being shipped almost daily. One party in town, by name of A. M. Payne, is shipping. Also one of our (worthy?) justices of the peace, John Mulligan, is shipping. Mulligan shipped a box yesterday afternoon to a certain commission house in New York city.

As I'm in business, I don't care to have my name in this. But I do think they ought to be stopped if it is against the law, as I think it is.

Any of this you may publish if you wish, but not my name.

[It is against the law to ship quail and partridges unless they are accompanied by the owner. We have advised our correspondent to communicate with Chief Pond.]

Currituck.

NEW YORK, Nov. 5.—A few lines in regard to reports from Currituck may be of interest. The outlook is simply immense for wildfowling. Letters to hand from Leon White report the ducks and geese in large numbers, with a good many of the different clubs' members down enjoying the sport. Jacksnipe have been unusually plentiful, also wood duck, while the bay birds, principally winter yellow-legs, are still with them—later than usual. White has an entire new outfit of live decoys and says they are acting well. He reports over 500 geese since the opening of the season, and other letters from natives confirm this. I am getting anxious to be there. Have four already for my party and want two more. Are there not two readers of FOREST AND STREAM who will join me? I will gladly give any one all information and guarantee them a royal good shoot. We propose to start Dec. 10 to 15, so as to be late enough for the swan. W. E. SAWYER.

Barneget Bay Ducks.

TOM'S RIVER, N. J., Nov. 13.—Gunning in Ocean county is excellent. Old-timers say that never in their recollection were there such large flocks of ducks on Barnegat Bay as during the past week. A sail boat would make them rise from their feeding ground in great clouds. However, but little luck attend the gunners, as the fine weather allows the birds to stay in the middle of the bay, where they are comparatively safe. Large flocks are also seen in the ocean, outside the surf line.

Some very good bags of quail are made by the gunners of the island, the largest being made by Longstreet Irons, of Jersey City, who bagged twenty-seven in half a day's outing. Rabbits are also very plentiful.

South Carolina Quail.

ROCK HILL, S. C., Nov. 7.—*Editor Forest and Stream:* I notice in the office of the Carolina Hotel a placard reading: "Report your luck to FOREST AND STREAM." In compliance with this request, and for the information of those who are fond of quail shooting, I beg to say: I left the hotel about 10 o'clock on the morning of the 4th and reached the hunting grounds about 10:30; found birds plentiful and bagged thirty-five, returning in time for supper. I would have had no trouble in making a bag of fifty had I been on the grounds in time for the morning shooting. ROBT. B. JONES.

Some New Jersey Covers.

ASBURY PARK, N. J., Nov. 14.—I have just returned from a tramp through some of old Monmouth's famous covers and find game of all kinds fairly abundant. Particularly is this true of quail; not in years have they been so plentiful, and all we found were good, strong, well-grown birds, tasking the skill of the shooter to the last degree, as the foliage is too much on tree and bush to make shooting easy. Still we secured enough of both fur and feather to satisfy the average mortal, not to speak of the gloriously bracing effect on mind and body which woodland rambles always bring. LEONARD HULIT.

New York Association.

ROCHESTER, N. Y., Nov. 12.—The annual meeting of the New York State Association for the Protection of Fish and Game will be held in the city of Syracuse, Thursday, Jan. 14, 1897, at the Yates House.

I trust that every club will send a good representation.

If you have any proposed amendments to the game laws to secure consideration at this meeting, a copy of same must be in the hands of each member of the legislative committee on or before Dec. 14.

F. J. AMSDEN, Pres.

Ducking in Wisconsin.

CHICAGO, Ill., Nov. 11.—Duck hunting at Shawano Lake, Wis., is good. Mr. Theodore A. Thomas, of Milwaukee, in three days this week shot 255 bluebills and redheads; weight, 485lbs. W B. K.

Sea and River Fishing.

MEN I HAVE FISHED WITH.

XXI.—Tay-bun-ane-je-gay.

WE named him—Henry Neaville and I. We had to call him something to distinguish him from other Indians who begged about our camp, and we did not think the name he gave as his own, Ah-mik-wash, "a beaver house," described him as well as the one we concocted, which means: "He takes so much at a mouthful." Ours was a perfect fit and before long I'll tell you how he got it.

Mr. James McBride, then living in Potosi, Wis., but now in Washington, D. C., had a contract to subdivide some townships in what is now Crow Wing county, Minn. The township lines had been run, each township being six miles square, and these were to be crossed by lines a mile apart into square miles, with the half miles marked on both north and east lines. The northern line was near where Brainerd now stands, the Mississippi River was the west boundary and the survey took in the village of Crow Wing, which was then an Indian trading post.

The party included Thomas Davies, now living at British Hollow, Wis.; Pierre Gibbs, of Dubuque, Ia.; —— Crosby, I think originally from Boston; Henry R. Neaville and the writer, both of Potosi. We started by steamboat from Dubuque, in September, 1856—I forget the day, but Tom Davies thinks it was the 12th—with two horses, wagon, pack saddles, tent and camp equipage and a supply of provisions that surprised me: Half a dozen barrels of flour, 3lbs. pork, a 10-gallon keg of molasses, 1-gallon keg of vinegar, sugar, beans, rice, grain for the horses, and all in profusion. At St. Paul half the provisions were stored and we took a wagon load, all but the driver walking up the big military road that led to Fort Ripley, about 100 miles north of St. Paul. Our first night out we camped on Rum River and Henry Neaville tasted it and said: "Hum! it's nothing but water." From Fort Ripley to Crow Wing the road was not so good. Making a base of supplies at the trading post, we struck into the woods and afterward Tom Davies drove back to St. Paul for the food left there. We took camp and grub on our backs. At the place to begin work I made camp and Neaville went back for more supplies. There was about 4in. of snow and this lay without thaw or addition until we left the woods late in December.

I had expected to furnish game for camp and took my rifle, naturally thinking that this far-off region abounded in game as the Bad Ax country, where I spent the previous winter, did. I lugged that rifle for two months and only killed four ruffed grouse. I saw one deer and two rabbits, but did not get a shot at them. The country was destitute of game. Indians swarmed all over it. At Crow Wing the great trail of Lake Superior crossed the one coming down from the Red River of the North, and the trading post was visited by scores of Indians every day from each of the four branches of the trails.

It was on the second day out. Henry had returned quickly, as we were not yet far from our base, and I was baking bread and getting dinner for two, as the linemen had theirs with them and would not return until night, when in walked the American whose name heads this chapter. As before stated, that was not his name then, but he didn't know it. He squatted by the fire and grunted: "*Bon jour*, Nidjee," a salutation of mixed French and Ojibwa that all those Indians used. Henry returned his salute and said to him in Ojibwa that he was welcome.

"Where did you learn to speak that?" I asked.

"Off up the Wisconsin River with a logging party one winter. Why?"

"Nothing, only I was surprised, that's all. If I'd known you spoke it we could have knocked lots of fun out of your brother Frank on our fishing trips. But you have made this man welcome, and that he will interpret to mean free feeding, perhaps all winter, and as I am camp keeper, McBride will ask questions if we feed too many. He doesn't like an Indian and told me not to have them hanging around camp, so don't do this any more."

"All right," said Henry, "I spoke without thinking. If there's lots of pork boiled let's fill this fellow up and see how much he can hold."

I told him that I had boiled enough pork for all hands to have cold to-night, but if his guest ate half of it I would boil more.

I made all ready, and our aboriginal American announced himself as Ah-mik-wash or "Beaver House." Henry remarked: "He differs somewhat from a beaver house, and as to the last part of his name I'll bet he hasn't washed in ten years."

"Henry, keep quiet!" then tapping my breast I said: "Kego-e-kay," and then touching Henry, introduced him as Ke-tim-ish-ke (He-is-lazy). Old Beaver House grunted, and I served an equal portion of bread, baked beans and pork to each. There was enough for Henry and me at the first serving, and long before we had finished I piled another big chunk on the plate of our guest.

"Henry," said I, "your friend's doctor has recommended him to take something for his appetite, and he s struck the place to get the prescription put up. Just see what he takes at a mouthful, and how he swallows it without sticking a tooth in it! I'll limit him to the pork and bread, for I'll be dingswizzled if I'll boil and bake any more beans."

Henry thought a minute—he was a meditative man and therefore a born angler—and said: "He is filling his beaver house for the winter, but he can swallow chunks of pork that would choke a deerhound. He must have a new name. These Injuns don't get a name early in life as we do, and when they get one it never sticks through as ours do, and we must name him anew. See that last chunk go down! Give him what there is left of the pork and put the rest away, and let's see him get away with what you had provided for six men to-night, in addition to what he has eaten."

I will publicly confess to being a sinner if that Ojibwa, or "Chippewa," as his name has been corrupted into, did not clean up every bit of the pork. There was no such discrimination between the component parts as was made by Jack Spratt and his wife. He removed the plate from his lap and said: "Koo-koosh, nish-ish-shin," or "Pork very good."

While our guest sat by the fire in full enjoyment of physical comfort Henry and I concocted the new name for him, and this is the way we christened him. I said, leaving out as much of his tongue as possible: "You no Beaver House no more, you Tay-bun-ane-je-gay (He-who-takes-so-much-at-a-mouthful). This name, which we evolved in a spirit of ridicule, was accepted by our simple-minded friend as a tribute to his prowess after he had scanned our faces and found no trace of levity; and he was so known, not only by us, but by his tribe.

He had caught Henry's name and smiled as much as an Indian can smile, but seemed in doubt about mine. Perhaps my pronunciation was at fault, for "kego" means fish, and also is a negative, as "do not," "never," "beware of saying," etc. Henry said: "We have many words which mean the same thing, and so have they. Old Swallow-'em-slick is in doubt. Show him your fish lines and he will know that you are a fisherman."

When our guest had seen my tackle he pointed to me in pride at his understanding and touched my shoulder, saying: "Kego-e-kay." Then he proceeded to tell what great pike, "kinoje," could be caught in a small lake a short distance away, and we arranged to try it next day after the men had gone on the line.

The ice was not thick, but would bear us well, for it was about the last of September or the first of October in that cold country, and this reminds me that McBride wanted to know about the winters in that region and asked a half-breed who spoke English how the weather was likely to be. He replied: "October, he pooty cole; November, he cole as de dev'; and December, he col'er 'an —." I had heard the name mentioned as a comparison for heat frequently, and wondered what kind of a place the half-breed thought it might be. The snow had fallen since the lake froze, and we could not see the depth. I asked old Mouthful where there were springs and he showed us one, where we caught a lot of minnows.

We cut holes and rigged about a dozen lines with tip-ups and waited. The holes froze over and we cut them open, but no fish came to our lures. It was noon, and not a pike, big or little, had sampled our minnows. We were like "Ye Sunberrye Fysher," our tackle was correct, but the fish were either absent or—something else. It was time to eat.

I asked Henry: "Do you think that old Mouthful, as you call him in shorthand, has brought us out here on a fool's errand? This lake should contain pike, lake trout, brook trout or perch, but we get no bites. The water is not very cold or the ice would be thicker, the springs below keep the ice from getting too thick. Perhaps our friend is only playing it on us for his grub."

"If I was sure of that," said Henry, "I would advise that we leave him, and go back and eat ours at camp or sit down here and eat, and only give a little bite, so that he could not take so much at a mouthful."

The luncheon was fairly divided. One of the tip-ups showed the flag, and Henry jumped and ran for it. The hook was bare; a minnow had been taken. Old Mouthful had probably divined our thoughts, for he arose and said: "Kego-e-kay-e-mah," there are fish there. We let our lines lower down, but got no fish. It was time to go back to camp to prepare for the hungry linemen. Our new friend went with us; it was evident that he was fond of our company—or our pork—it was not easy to tell which. He saw the men come in and eat their dinner, but got no invitation to join, for our chief did not wish to encourage Indians to hang round the camp. Two such men as He-who-takes-so-much-at-a-mouthful would breed a famine in our commissary in a short time. They would eat more than our six healthy white men who had the abnormal appetite that comes with a life in the woods and active exercise in cold weather. The farmer's expression, "I'm as hungry as a hired man," fell short of our appetites.

We had a tin bake oven made in flat sections for packing on a man's back, which when set up before a campfire flared out so as to reflect the heat from top and bottom on a bread pan in which we not only baked bread, but beans, pork and coons. Imagine a yawning front of 18in. sloping to a back of 5in., in the middle of which was the pan, and you have the idea. Mixing soda and cream of tartar with the flour and then wetting it up—well! If you don't believe that I made the best bread that was ever baked on this planet just write to my *companion du voyage*, Thomas Davies. Mark the letter "private," because Tom has been married since that time and he might not wish Mrs. Davies to see his reply; he is eating her biscuits now. Married men will appreciate this caution.

Four men went on the line—McBride, the chief or compass man; one axe man to clear a place for him to see through and to blaze the line, and two chain men. There was then an extra man to bring supplies from our base, and he was in camp with me a great deal. Henry Neaville did most of this work, because he was a very good woodsman and could find me when I moved camp. Sometimes we stayed several days in a place, and lines would be run in all directions. In the morning I would get an order to "Keep camp here to-day," or to move it. If moved, it might be "two miles east and one mile north," and then before sundown I would clang the cow bell which we sometimes used on the horses when hobbled. We used the horses to pack our camp at first while in the country of solid ground, but sent them to Crow Wing when we got into the swampy country, where the springy swamps were frozen enough to permit a man to travel safely without snowshoes, but would not hold the greater weight of a horse with its smaller foot. It would have been almost impossible to run these lines before the swamps were frozen. I saw all the corner stakes set and "witness trees" marked, and when the man removed his hand from the top of the stake it fell. There were no stones to be found for markers; but the trees told the story, and the exact place of the stake could be found.

I can't say when it was that we met a train of Red River settlers on their way from Pembina,* perhaps it was on our way up, but it was an event. We heard the creaking of their carts for at least ten miles before we met. There were eighteen carts in the train drawn by

* Will the "gentle reader" oblige my educated ear by pronouncing this name with the accent on the last syllable, as Pem-bi-*naw*? I ask this because the tendency is to mispronounce Indian words like this. If they will favor me in this instance they will never say Man-i-*to*-by, but Man-i-to-*bah*, bringing all the force on the ultimate, and they can't slur the first three syllables too much for correct Ojibwa ears. Why not? That's the way the natives speak these names.

ponies, and not a bit of iron in the whole outfit! Not even a nail. The wheels had wooden tires held by wooden pins, and if one gave out there was the forest to furnish material. Some of the carts had a ham rind under the axle, but that was a foolish concession to the god of silence. The others shrieked and wailed like lost spirits, and miles before we met them we were wondering what could make such unearthly sounds. We halted and talked with the priest who was in charge of the expedition and seemed to be the only man in the party who could speak English. The other men were French, Indians and half-breeds, and they spoke such a *patois* of mixed Ojibwa and Canadian French that Crosby couldn't understand a word, and he spoke Boston French fluently. The priest was a jolly old fellow, a well-read man who, it seemed to me, was wasting his life among a very dirty lot; but if he was contented we should be. I listened to him talk of his mission work and of his hope that there would be a weekly mail up from St. Paul into his frozen region before many years. His people had sold their furs; the Hudson's Bay Company had a monopoly of the trade in British America, and they brought nothing to sell. They were going to St. Paul to buy coffee, sugar, clothing, garden seeds and other things; but why they didn't buy of the company I don't know. His great good nature and hopefulness made him very interesting, for he was a good and lovable old man. Ah me! If the camera and dry plates had been invented in those days and I had owned an outfit, what treasures I would have to-day!

Tom Davies went to St. Paul for the rest of the provisions early in October and was gone ten days. Henry froze both his feet by riding on the hind end of the wagon with his feet hanging out after he had met Tom at Crow Wing, for we were still in a country where the wagon could be used. It was night and Henry had told Tom that Crosby was lost in the woods, and he hurried on at once because there were but three men on the line. They reached camp while we were breakfasting, but Henry could not stand. He had foolishly worn leather boots, while the rest had shoe-packs of elk-skin, soft and warm in dry weather. This reminds me to say that the Indians about us wore moccasins of buffalo which cost $1 a pair at Crow Wing, but did not wear well. After the men were gone on the line I took Henry's boots off and put his feet into snow and by chafing them got the blood started. He joked about my cutting his feet off and his missing the dancing that winter, as they swelled so that there seemed to be danger, but in a week he was able to walk and by cutting one boot for a favorite toe he was soon ready for duty.

I kept up half-hourly rifle shots and cow-bell ringing for Crosby and he came into camp, having been out one night without matches or blankets. He had kept from freezing by walking and had got turned around and followed the blazed lines the wrong way. Hunger had made him colder and he had thrown a stick at a bird, probably a Canada jay, hoping to kill it and eat it raw. He had an appetite of great length, breadth and thickness, one worthy of the man whose name heads this article.

Gibbs was very fond of staying in camp with me when Henry went on the line and he could do it. An excuse to mend his trousers or other clothing served. He was the youngest of the party and fresh from school. He knew all about Indians, for he had read about them, but was curious to study them in the woods. He was a gold mine to old Mouthful or any other Indian. When he offered a pipeful of tobacco he handed over a whole plug of Navy or such part of one as he had, and when the Indian cut a pipeful and kept the rest Gibbs thought that he didn't mean to do it, but couldn't ask for its return. He continually gave me advice on the subject of getting on with them, and I enjoyed it. Once as we sat down to a midday bite Gibbs passed the pan of hot biscuit to old Mouthful, who dumped the lot in his dirty blanket. I had frequently told him that an Indian always understood that what you handed to him was his, but there the biscuit were.

"Explain it to him," said Gibbs, "I can't speak his lingo, but we've got to have some bread for our dinner, and I don't really fancy getting it back after he has handled it and had it in that blanket."

"Gibbs," I replied, "there is no need to explain it. You gave them to him; of course you didn't intend to give him the whole output of the bakery, but you did. Now the only thing to do is to go and take what you want without any more ceremony, replevin them; use force if necessary, but get back our biscuit. We need not eat the outside of them, there's a lot of good bread inside which his dirty hands haven't touched."

He looked at the bread and then said: "I don't like to be impolite to him. Why can't you tell him that it's all a mistake; what's the word for mistake in his patter?'

"Oh, just say to him: 'Nidgee, pungee iskoodah wabo,' and it will be all right."*

The red man had not paid much attention to our talk, which he could not understand, but my last words must have had a familiar sound, for he turned his head and looked at me.

Gibbs arose and repeated the words in his purest Chippewa. Old Mouthful also arose, as befitted such an important occasion, grunted, shook hands and replied in fairly good Ojibwa that he "didn't care if he did."

"What's that he says?" asked Gibbs.

"He says that he begs your pardon and hopes that he has not offended; and he begs that you will take the bread and give him such a portion as will not rob yourself."

Gibbs struck an attitude and exclaimed: "Now, by my halidome! Our guest is a gentleman of right courtly manners. I tell you, Fred, you don't know these people if you have been around a few of them long enough to pick up some of their talk. I've read up on 'em, Scoolcraft, Cooper and these authors; have studied, 'em and the noble red man has all the high-bred instincts of the most chivalrous knight, but these men who come among them to trade are not sufficiently educated to see and appreciate it." He then took up the bread, broke off a third of it and gave it to our guest.

Old Mouthful looked surprised. Evidently he didn't mind the bread as long as there was whisky in prospect. After a pause he looked at Gibbs in a way that the Governor of North Carolina might have done at that historic meeting with the Governor of South Carolina, and merely remarked: "Pungee 'scutah wabo?"

"What's that he says?" asked Gibbs.

"He asked you for some whisky, and he thinks you promised him some in exchange for the bread. I begin to think so myself, since I compare your pronounciation of Ojibwa with his and mine. There are some very nice shades of inflection in Ojibwa which make a word mean several things. You have told me how revengeful an Indian is, and you have mortally offended this man, and unless you give him what you have promised it may go hard with you—and in fact with all our party, for we are only six."

"What will I do? I haven't any whisky, and there's none in camp."

"He won't believe that. He has seen a 10gal. keg of molasses, but you don't suppose for a moment he believes it to be molasses? The kegs he has seen with white men have always contained whisky. I don't know how you can square it with him. You've got yourself into this scrape, but I'll help you out if I can."

I told our guest that Gibbs had not understood, "gowin kendun," but that instead of whisky he meant to offer tobacco. That was satisfactory—it had to be—and Gibbs gave up a whole plug of Navy, and there was peace in the land. Gibbs felt that I had successfully arbitrated the case and averted a calamity. What our guest thought was impossible to tell, but Henry and I enjoyed the thing by ourselves, and afterward Henry guyed Gibbs about it at every chance.

We had left civilization early in a presidential campaign. The Democratic party had nominated James Buchanan, and the newly-formed Republican party had named John C. Fremont as its candidate. Our little party of six was divided in its choice and in the evenings the argument waxed warm, but always in respectful shape. The date for the election had passed, but we knew nothing of the result. But what hundreds of bushels of oysters were bet! It would have required several smacks to have carried all these oysters if the stews, fries and raws had all been eaten. The fact is that no records of bets were kept, and each night the old score was forgotten and new bets were made. When we got back in the vicinity of Crow Wing—about Dec. 20—we first heard the result, and the Buchanan men were jubilant. It served us well as a topic of interest, for it was not a jolly crowd, and what it would have done for amusement without the election is a question.

Unless Henry or Gibbs was in camp I did not dare leave it. These Indians might be honest enough, but in our case it was well not to take any risks on our provisions. One day, while out with my rifle, I came to a lake of which I had a glimpse through the trees. Standing awhile, there came a faint whining sound which I at once diagnosed as the talk of a bear. Here was a chance to get a shot at bruin, and perhaps some fresh meat. Carefully looking at the cap on the rifle, I cautiously worked down into the marshy ground and underbrush in the direction of the sound. The marsh was frozen or the passage would have been impossible. The sound came from one direction, but did not seem to increase as I advanced; but it was a bear, sure. Getting near the edge of the lake, as could be seen off to the right, the game must be close, and that creepy, trembling feeling came on. I halted and listened; it was but a few feet away. Through the brush a dark object could be seen on a log, and the whining kept up. If it was a bear I wanted to see how it stood in order to plant the bullet right; but in stepping one side I made a slight noise, and an Indian boy about six years old turned around. He dropped, crawled behind the log, and then jumped into the brush and out of sight. Probably it was the first white man he had ever seen. Then I knew that what I mistook for the whining of a bear was the boy's low singing. The story he told his mother would be interesting, if we knew it.

Getting back to the higher land again, I sat awhile on a log enjoying the clear, cold air and the glimpse of the frozen lake. After awhile there was another sound of life, and I saw a sight which I never have seen recorded by any writer of the woods. Below, in an open spot in the underbrush, perhaps of 20ft. diameter, and not over 20ft. away, came a troop of about thirty ruffed grouse or partridges of the Eastern States, and they were clucking and chattering at a great rate. The males were strutting with tails spread out like turkey cocks, or more like tame pigeons. I was in plain sight, and tried not to breathe for fear of disturbing them, for it was the treat of a lifetime. Among these birds was a male, I had no doubt the same species, which was black. Of course I can't at this late day, and in view of my very slight knowledge of such things at that time, be certain that this was a case of melanism in Bonasa, but I believe it.

Later I saw several ptarmigan, which I then thought to be white ruffed grouse, but did not kill any. Something alarmed the partridges and they flew into the trees, and I picked off three. The shots brought an Indian, a stranger, who begged for a bird, and I gave him one. These men were persistent beggars; they thought every white man was wealthy. They seemed to roam the woods without either gun or bows, and I afterward learned that they lived mainly on fish, which they dried for winter. No doubt they knew how scarce game was, and that it was useless to hunt for it. I was greatly disappointed; I had left the East two years before because of the scarcity of game, and here I was in a primeval forest where there was no game, hardly a rabbit. Disappointed hardly expresses it. Why, we could go out from Albany in that day, in most any direction during the winter, and bag a few ruffed grouse, some rabbits and a squirrel or two; I began to think the far West a fraud; Minnesota was then "far West." The biggest lot of game I saw in northern Minnesota that winter was four young coons that Tom Davies killed with an axe as they huddled near a tree on an extra cold morning. I parboiled and baked them, and—oh, my!

Our friend, who possibly might bite off more than he could chew, but never more than he could swallow, had ceased to be interesting. He found our camp at every move, and seemed to regard himself as part of it, or at least one of the volunteer staff. Neaville and I paid little attention to him, but his eye brightened when he found Gibbs in camp. Gibbs was curious about him, wanted to learn his language, and would touch objects and ask their names by looking up and saying, "Ojibwa?" Then, of course, he could do no less than "divy" on pork and tobacco—a very good arrangement for his friend. Speaking of tobacco, we once found old Mouthful with the native article, the "killi-ki-nic," or inner bark of the red willow. Henry and I tried it once. It was most pungent, and I can only compare it to smoking rattan and elm root, which we schoolboys used before we aspired to tobacco, and it almost burned our tongues off. I think some of the old boys, and perhaps some of the younger ones, will recall their brave attempts to smoke things, no matter how pungent, which did not upset and invert their youthful stomachs. Fifty years ago most boys in America thought it smart to chew tobacco, and they acquired the disgusting habit, but the younger ones would get licorice ball, and spit in imitation of a tobacco chewer, and then some unbeliever would challenge him with, "That ain't tobacco you're a-chewin', it's on'y lickorish!" Yes, I was a boy once.

These Northern Indians must smoke, but tobacco was an exotic which positively declined to grow so far North, and, like the boys, they found a substitute. After they found the Southern weed it was too costly to use alone, and they mixed it with killi-ki-nic merely for economy; but preferred pure tobacco when they could get it.

"This reminds me." In my young days, when I was particularly fond of negro minstrelsy and burlesquing things, and shortly after the time of which I write, Longfellow published "Hiawatha," a poem which I never tire of reading, but one whose meter urgently invites burque; and with hundreds of others I essayed it. Elsewhere I have said that some people seemed shocked at seeing a thing which they love burlesqued. That means that their sense of humor is only partially developed. Then and to-day I regard "Hiawatha" as the great American epic, but I wrote:

"Should you ask me whence I got them,
Got these yarns of old James River;
With their flavor of tobacco,
Of the stinkweed, the mundungus,
And the pipe of Old Virginny,
And the twangle of the banjo;
Of the banjo, the goatskinnit,
And the fiddle, the catgutta,
And the noisy marrow-bonum,
I should answer, I should tell you:
By one John-smith they were written.
John-smith, soldier, sailor and explorer,
Editor of his own adventures
In the land of Po-ca-hon-tas,
In the realm of Pow-ha-tan,
Where old John-smith had a big time,
Filled the red man full of whisky,
Stole his daughter and sailed eastward
To the far-off land of John-bull," etc.

There were yards and yards of this stuff, but we will content ourselves with that. It's easy to write, any boy can do it, and the grandest of themes are the easiest to burlesque. That is a fact that human owls fail to understand. What is easier to travesty than "Chronicles"? And it is often done without intending irreverence; the humor of the thing is the only thought of the writer; but "a jest's prosperity," etc.

Here you see the evil effect of tobacco, how it will lead a man off the track to talk about Pocahontas and other irrelevant things. It's fortunate for some one that my pen did not go off after Sir Walter Raleigh and the story of his weighing the smoke which came from Queen Elizabeth's pipe, but every schoolboy knows all about that.

We found another thing that the Indians used; it was the "man-o-min," or wild rice. This is mighty good feed for wild ducks or Indians, but, as they ate it, there was a grit in it which detracted from its value to men who don't like to eat the hulls of grain. Hardly a night but half a dozen Indians slept by our fire and cooked their wild rice over it, but if they could get our Southern rice they were glad. It's many a day since I ate the man-o-min, but the impression now is that if it had been properly hulled it would have been good.

Along the streams we saw where the wild rice had been tied up in bunches to keep it from bending over and being eaten by the wild ducks while it was in the milky state or after. Then, later in the year the women paddled up the stream, bent the heads of rice over and with a light stick threshed them into a canoe.

Gibbs was always curious to taste their food; he had the true instincts of an investigator and got more information in that line than we, who were more cautious of getting too intimate with the aborigines, for fear of our stock of provisions.

We came out all right on the rations and had all we wished to use, but the story of the winter is too long for one telling.

FRED MATHER.

* These words mean: "Friend, will you have a little whisky." "Iskoodah" is a word meaning a fire, comet, lightning, etc., and "wabo" or "wabah" is water.

New Jersey Trout Planting.

CHIEF FISH AND GAME PROTECTOR CHARLES A. SHRINER reports to the New Jersey Commission for October: The principal features of the work of the past month consisted in delivering trout and in the large number of prosecutions for violations of the fish and game laws.

The trout were obtained from Plymouth, Mass., under an agreement by which the Plymouth Rock Trout Co. agreed to deliver to your Commission 50,000 trout in New York city. Wardens were placed in charge of the trout at this point, and the fish were distributed to persons having applied for the stocking of suitable streams. The work has been nearly completed and has been very successful, the trout in all but one instance arriving safely at their destination. One can, sent to Englewood, contained a large number of dead fish; all the others were delivered without the loss of a single fish or of only a very few. The trout were between 2 and 3in. in length and were shipped in cans each holding 500.

Lake George Pickerel.

NEW YORK, Nov. 12.—*Editor Forest and Stream:* Mr. D. C. Dean, of the American News Company, spent much of his time fishing while at Lake George this summer. He caught a number of bass and some very fine pickerel. One of his pickerel weighed 12lbs. and another 9lbs., while several weighed 7lbs., and a number of 5 and 6lbs. were taken.

Mr. Dean thinks the pickerel deserves a high rating as a game fish and that it should have better protection than it now enjoys. He says that as things are at present hundreds of fish are slaughtered in the early spring at the expense of the summer fishing, and that the interests of the numerous summer visitors are sacrificed to those of a few early fishermen.

B.

ANGLING NOTES.

English Angler in America.

READERS of this journal will remember Mr. Alfred C. Harmsworth, who furnished the sinews of war for the Jackson-Harmsworth Polar expedition that found Dr. Nansen; but he will be remembered by anglers chiefly for the tarpon article which he wrote for FOREST AND STREAM and for the Badminton Library, as he came to this country on a fishing expedition, and after trying the tarpon in Florida waters pronounced it the finest fishing to be obtained anywhere. Lately the New York newspapers have stated that Mr. Harmsworth was about to establish an edition of one of his many newspapers in New York city, and on this subject he writes me from London as follows:

"Your letter explains a mystery. Several letters have reached me asking for work on some proposed journal. Having so far retained my mental equilibrium, I have no intention of rushing in where angels fear to tread, and my eighteen newspapers over here occupy my time fully. I have, however, managed to get a very good ten days' angling this year. I had about four days—single days—with the trout, and did well always. I have just got back from Scotland. But I am not yet a good salmon angler. My best fish was 23½lbs. The tremendous casting and the cold wading of the Tay are more than I can stand. It is veritable labor of the worst kind. I am still trying to get to your side and the tarpon again, and will let you know if I have any chance of getting across."

Mr. Harmsworth has been good enough to offer to send me a collection of English fishes, mounted, of his own catching, trout, pike, roach, perch, bream, etc., for the purpose of comparison with our own fishes, and already some of the fishes have been prepared. It will be a valuable collection and serve as an object lesson, and for this reason I will share it with fellow anglers in some way, perhaps by putting it on exhibition at the New York Aquarium when it is opened to the public. I think English anglers are much more given to mounting specimen fish than we are, although the custom is growing in this country, and it is one to be commended. A young man brought me last year the outline of a yellow perch on wrapping paper. The fish weighed 2lbs. and was by far the largest perch ever taken from the waters of Lake George, where the perch are fine flavored, but do not grow to ½lb. except in rare instances. It was glad of the outline of the fish on paper, but would have been much more pleased to have had the fish for mounting, but it had been eaten. The young man's father once caught what was reported to me to be a record black bass of the smallmouth species. I drove hastily to his house only to find the fish in the oven being cooked for dinner.

Fish Distribution in New York.

The State of New York during the year ending Sept. 30, 1896, hatched and distributed in the waters of the State 190,519,218 fish of all kinds. In addition the U. S. Fish Commission contributed to the waters of the State a total of 27,417,533 fish, so that the State waters received during the year a grand total of 217,936,751 fish.

In 1895 the total distribution of fish in the State amounted to about 191,000,000, of which the United States Fish Commission contributed about 17,000,000 (these figures are from memory), so that for the year ending Sept. 30, 1896, the State hatched and distributed from its own hatching stations nearly as many fish as the total from its own stations and the United States combined for the previous year. The fish hatched and distributed by the State from its own stations were as follows: Trout, 7,675,060; pike perch, 41,315,000; mascalonge, 1,815,000; black bass, 43,458; ciscos, 27,500,000; whitefish, 11,250,000; frost fish (round whitefish), 9,700,000; shad, 8,690,200 (probably twice as many as ever before hatched in one year by the State from eggs taken in the Hudson); bullheads, 1,500; tomcods, 44,000,000; smelts, 34,000,000; lobsters, 4,414,000; fresh-water shrimps, 115,000. From these figures it is plainly to be seen that the Fisheries, Game and Forest Commission is devoting its attention more to the so-called food or commercial fishes than to the so-called game fishes. Many of the fish contributed by the United States Fish Commission were contributed in the form of eggs, which were hatched and planted by the Commission and do not appear in the table given above, which consists of fish hatched and planted from eggs taken from stock fish at the hatching stations, or from eggs taken in State waters. For instance, the total plantings of shad in the Hudson amounted to 13,285,200, the grandest plant ever made in this river since the beginning of fishculture in the State. The Commissioners erected a new shad hatchery at Catskill, where the eggs were hatched in jars under cover instead of the old-fashioned shad boxes operated in the river with the sky for a roof, but I presume they will describe this work in detail in their annual report.

Bullheads.

There was a note in this column about bullheads recently, since which time I have learned something new concerning them. I was visiting a friend who has a camp on a trout lake which he owns in the Adirondacks. The time was during the last of the month of September. Bullheads were schooling at the surface of the lake, "bulling," the natives called it; when a school of the fish were seen at any part of the lake a rap with a paddle on a boat would cause the school of bullheads to jump from the water. It was not necessary to see the fish, for a blow on the timbers of the boat landing would cause the fish to jump in the middle of the lake. One sharp blow on the gunwale of boat, canoe or boat landing, the timbers of which run down into the water, was all sufficient to cause the fish to jump if they were at the surface, and the whole school jumped as if frightened.

Silkworm Cocoons.

Dr. Theodatus Garlick, the "Father of Fishculture in America," gathered the cocoons of American silkworms, reared the worms, and from them drew gut that was "9ft. long and equal in size and strength to the best salmon gut"—that is, such gut as is used in salmon fishing. Gut from the Chinese worm is not 2ft. long in the size used for salmon fishing, and if leaders could be produced in one price, free from knots, it would be a boon to anglers. Mr. C. F. Orvis has reared the worms and drawn the gut, but it lacked strength, probably because the worms were not furnished with suitable food. No one seems to know what the food of the worms should be to produce strong gut from the silk sacs, although Dr. Garlick and Dr. Sterling both mentioned to me that the button bush was the natural food of the worm in Ohio. It remains for some one to discover the proper food of the American silkworm to produce the requisite strength in the gut when the silk sacs are drawn.

Some time ago I cut from a New York *Tribune* an article describing a cocoon hunt, from which a collector could distinguish the cocoons of the different moths, and resolved to quote from it when the time came to gather the cocoons, hoping to interest some one who has the time and inclination to experiment in producing long gut for angling purposes.

The moths producing the greatest amount of silk are *Atticus cecropia, Polyphemus* and *Prometheus*, although the *Atticus luna* may produce a large strand of gut; but it is a rarer moth than the others, as a rule. The article I have mentioned says of the *luna:* "The caterpillar of this moth lives on the walnut and hickory, on which it may be found, fully grown, toward the end of July and during the month of August. It is of a pale and very clear bluish-green color: there is a yellow stripe on each side of the body, and the back is crossed between the rings by transverse lines of the same color; on each of the rings are about six minute pearl-colored warts, tinged with purple, and furnishing a few little hairs, and at the extremity of the body are three brown spots, edged above with yellow. When about to retire for its winter sleep it draws together with silken threads two or three leaves of the tree, and within the hollow thus formed spins an oval and very close and strong cocoon about 1¾in. long, and immediately afterward changes to a chrysalis. The cocoons fall from the trees in the autumn with the leaves in which they are enveloped, and the moths make their escape from them in June.

"A moth whose caterpillar is much like that of the *luna* both in coloring and habits is the *Polyphemus*. He makes his cocoon in the same manner and drops to the ground in the autumn. To find the cocoons the searcher must turn over the dropped leaves of the oak and birch.

"The caterpillar of the *Atticus cecropia* anchors his winter home longitudinally to the side of a twig. It is on an average 3in. long and 1in. in diameter at the widest part. Its shape is an oblong oval pointed at the upper end. It is double, the outer coat being wrinkled and resembling brown paper in color and thickness; when this tough outer coat is cut open the inside will be seen to be lined with a quantity of loose, yellow-brown strong silk, surrounding an inner oval cocoon composed of the same kind of silk, and closely woven, like that of the silkworm. The caterpillar feeds chiefly on the apple, cherry and birch trees, as well as on currant, alder and barberry bushes, and its cocoons may be found where they grow.

"The caterpillar of *Atticus prometheus* has a particular love for the leaves of the sassafras and wild cherry, though he may also swing his hammock from the twigs of the elder bush, the azalea, the swamp pink and the buttonball. A few brown and curled leaves may frequently be seen hanging from a tree or bush when all the other leaves have fallen off. If one of these leaves is examined it will be found to be retained by a quantity of silken thread which is wound around the twig to a distance of ½in. or more on each side of the leaf-stalk, and is thence carried downward around the stalk to an oval cocoon which is wrapped up by the sides of the leaf. The cocoon itself is about 1in. long, and so strong is the coating of silk that surrounds the leaf-stalk and connects the cocoon with the branch that it cannot be severed without great force, and consequently the chrysalis swings securely within its leaf-covered envelope through all the storms of winter."

There is another moth, the caterpillar of which spins silk, which is comparatively new to this country. Like those already mentioned, which have been called American silkworms (although the writer I have quoted says of the *cecropia* that the cocoon is "composed of the same kind of silk, and closely woxen, like that of the silkworm," as though the worm were not a silkworm), it is a large moth and may produce as much gut as any of the worms mentioned. This moth is the *Atticus cynthia* and came to America from Japan with the ailanthus tree, on which it feeds exclusively and on which it spins its cocoon. The cocoon is larger than that of the *Prometheus* and is spun with a whiter silk. "Like the *Prometheus*, the cocoon is chained, if not to the rock, at least to the twig, and a hurricane would only rock the chrysalis into a lullaby. The moth expands from 5 to 5½in., has pale olive-green wings, bordered by a pale lilac and white streak on its upper and lower wings."

I have a friend who is an enthusiastic collector of cocoons and he gathers many of them, but I cannot induce him to rear the worms and draw gut from the silk sack, for he is not an angler, and he prefers to impale the moths on pins and put them in a case. It is not unusual to find the moths about the electric street lights, but the *luna* is rare as compared with the other big moths. However, it is not the moths that the collector must seek if he desires to experiment with silkworm gut. When the moths escape from the cocoon they mate and live but a short time after depositing their eggs, which hatch into caterpillars.

Birch Bark Cup.

Birch bark serves many purposes in the woods, and this year one of my guides in Canada made a drinking cup from birch bark that was to me entirely new in form. Coming over a portage, the men took the canoes first, leaving the pack with all the drinking vessels behind. A cup was needed, and one of the guides procured a piece of birch bark, made a cornucopia of it, cut off the pointed end, split a green twig, inserted the lower end of the cornucopia in the cleft, pinched the open ends of the cleft twig together with his fingers and presented it to me. It was better than a hat or your hand, and almost as good as a tin cup.

A. N. CHENEY.

Transporting Crayfish.

IN last week's FOREST AND STREAM Mr. Cheney suggests for transporting crayfish to place them in water, changing the water occasionally, etc. My experience has been that many will die when kept in water, and that the greatest success is attained by placing grass sod in a box, with a cover having holes bored in it; moisten the sod somewhat and keep the cover on the box to prevent crayfish from crawling up and out. I have kept a supply for several weeks in that way with no loss. The crayfish will be found when wanted by pulling the sods apart. They can be transported any distance if kept cool.

SPENCER M. NASH.

New Jersey Coast Fishing.

ASBURY PARK, N. J., Nov. 14.—The destruction of the fishing pounds along the coast has brought a season of conditions which give joy to the angler. Surely not in years has fishing been better than for the past two weeks. The catches of plaice or fluke have been something enormous; tons have been taken by rod and reel, while weakfish, ling and what is something of a phenomena, the codfish, are taken directly from the beach. Never before have I known the cod to be so close inshore; they are attracted by the sand eel or sand lant, which is a favorite food for all fish at this season of the year, and they are now on the coast in enormous schools. They are distinctly a cold-water fish, rarely sojourning further south than Cape May, where they apparently leave the coast and pass out to sea, where they are pursued and greedily fed upon by the cod and other carnivorous fish. Their place in nature is quite similar to that of the menhaden, being a bait fish. I have frequently known the weakfish to scorn all other baits and take the sand eel greedily at every cast. If there is any better sport than taking weakfish from the surf when they are in a biting mood I have never yet discovered it.

LEONARD HULIT.

Sunapee Saibling for New York Waters.

LAST week State Fish Commissioner A. N. Cheney brought from Lake Sunapee, N. H., forty-five saibling which were put out in Lake George, with ten for the Caledonia hatchery and four for the New York Aquarium. He germed also 6,000 saibling eggs, which went to Caledonia.

This is the first time saibling have been taken out of New Hampshire for stocking purposes; it may be regarded as the beginning of an important enterprise of adding the formed fish to many of the waters of this State.

The saibling has always been claimed by New Hampshire as an unique possession, shared by none of her sister States. It will be remembered, however, that some years ago Mr. James Annin, Jr., the present Superintendent of Hatcheries of New York, suggested that there might be saibling in Sterling Lake, which is in Orange county, fifty miles from New York city.

Florida Fish and Game.

BROOKSVILLE, Fla., Nov. 12.—In the bay at Bay Port, Fla., last Wednesday, a fisherman caught in his net a tarpon measuring 4ft. Three fine deer were killed near Brooksville by Col. Martain and A. N. Chef. Quail are in abundance in this county.

J. WATKINS LEE.

The Kennel.

FIXTURES.

BENCH SHOWS.

Dec. 1 to 4.—City of the Straits Kennel Club's local show, Detriot, Mich. R. H. Roberts, Sec'y.

Dec. 8 to 11.—Augusta, Ga.—Georgia Poultry and Pet Stock Association. J. W. Killingsworth, Sec'y.

Dec. 15 to 18.—Central Michigan Poultry and Pet Stock Association's show, Lansing, Mich. C. H. Crane, Sec'y.

1897.

Feb. 2 to 5.—New England Kennel Club's annual show, Boston.

FIELD TRIALS.

Nov. 23.—Newton, N. C.—U. S. F. T. Club's fall trials. W. B. Stafford, Sec'y.

Dec. 14.—Athens, Ala.—Dixie Red Fox Club's second annual trials J. H. Wallace, Sec'y, Huntsville, Ala.

1897.

Jan. 11.—Tupela, Miss.—Continental Field Trial Club's quail trials. P. T. Madison, Sec'y.

Jan. 18.—West Point, Miss.—U. S. F. T. C. winter trials. W. B. Stafford, Sec'y, Trenton, Tenn.

Nov. 8.—Carlisle, Ind.—Union Field Trials Club second annual trials. P. T. Madison, Sec'y, Indianapolis, Ind.

DOGS IN TOWN.

HARTFORD, Conn.—*Editor Forest and Stream:* I read with some pleasure the contemplated action of the Board of Health of the City of New York in the matter of dogs running at large in the streets of the city. Although I am a dog owner myself, I realize that those who are not dog owners have rights which are bound to be respected, and those who are dog owners have rights too—of which they have a right to the enjoyment of their property in dogs, but they have no right to make their dogs a nuisance to others or the public at large. Many people are so blinded by their personal affection for their dogs that they seem to consider any objection to them as a personal affront aimed at themselves and resent it as such. They do not consider that their dogs may be an annoyance or intrusive or even a nuisance to others.

In the great cities especially are dogs a great nuisance, and their offensiveness is greatly aggravated by the doings of the owners, either from neglect on their part by allowing their dogs to run at large and thereby giving them an opportunity for all kinds of offensive liberties, or by turning them into or leading them in the street for the sole purpose that they may relieve their animal needs.

It is not an uncommon occurrence for dogs to soil ladies' or gentlemen's garments in the streets if the wearers are stopped in conversation, and the soiling of food and groceries displayed in front of stores and markets is a very common occurrence, a most exasperating imposition and a cause of direct loss to the tradesmen.

Many people take their dogs with them when they go shopping or to market, giving the dogs the freedom to overrun the place and in a way presuming on the tradesman's fear of the loss of trade to restrain him from resenting the gross imposition. The proper treatment would be to kick the offending dog into the street. No tradesman, however, cares to take such initiative, as not only would force make a spectacular disturbance of his business, but there would be such a gross perversion of the facts and such an exaggeration of its importance that it really might make a scandal and a consequent serious disturbance to his business.

It is a strange phase of human nature that so much of imposition will become almost a custom when those who are imposed upon cannot resent it. Suppose that the tradesman in delivering his goods to his customers was to take his dog with him and let him overrun the house, soiling such articles as pleased his fastidious fancy, stick

ing his nose everywhere in cupboard and kitchen, the customers would soon be in a state of rebellion, an appropriate action, and yet what are their rights are also ours, and we should have them by the courtesy which is supposed to be accorded to all in society.

However, strange as it may seem, some of the most constant offenders are people of wealth and breeding, who know better than to let their dogs become a nuisance, but take advantage of the tradesman's dependence on their custom to inflict the imposition upon him. It is ungenerous, unkind, wrong and injurious, and I for one will welcome the day when the law will interpose and afford us a protection which we now cannot obtain.

That the abuse of the public rights is widespread is proved by the contemplated action of the Aldermen in the city of New York. That it is an intolerable nuisance to tradesmen I know to my personal loss and my personal indignation. That the public health is menaced by making a sewer of the public streets is too apparent to need argument to maintain it. If the dog owners will not respect the rights of the public (and experience proves that they will not), then the public, by virtue of legal enactment, should force them to do so, and thus secure for the public the rights which the dog owners are so insistent upon for themselves whenever their rights are invaded to the slightest degree.

I write this to FOREST AND STREAM, of which I am a constant reader, in the hope that it may tend to bring about a spirit of decency among those who own dogs; and I assure them that they will be much better liked by their grocers, their butchers, their marketmen and their neighbors, if they will keep their dogs at home or even kill them on any pretext.

It may be said that the tradesman derives a benefit from the greater purchases made in behalf of the dog. Such trifling gain is of a thousand times less importance than the annoyance, even if there were such gain; but as in most instances dogs are fed on the scraps that would otherwise go into the garbage box, or on the scraps which are begged from the butcher or wheedled from him as a make-weight to a trade, the tradesman cannot charge himself with much ingratitude to the animal, which he detests as a most unmitigated nuisance.

The tradesman suffers all the loss. Be the injury what it may, the dog owner affects obliviousness of it. He or she will affect the greatest urbanity and evidence of good faith in making a purchase by way of diversion from the dog's offense, and at last concluding with some trifling purchase of a value whose total is less than the injury inflicted by the dog, to say nothing of the irritation of mind produced by such gross imposition.

I hope others will take up this subject, and so hold up the offenders to public opinion and exposure that it will accomplish what a sense of decency has so far failed to do.

AFFLICTED TRADESMAN.

ALBANY, N. Y.—*Editor Forest and Stream:* I understand that it is proposed to procure such legislation as will prevent the appearance of dogs, under any circumstances or restrictions, on the streets of New York. Will you allow me an additional suggestion? Namely, that horses should also be prohibited. It is well known that now electrical conveyances of various kinds can be procured, and certainly horses do more toward the defilement of the streets than dogs. Also, would it not be well to have such laws enacted that would prevent the fall of snow in New York during the winter?

CLARENCE RATHBONE.

THE PENINSULAR FIELD TRIALS CLUB'S TRIALS.

OUR trials began here, at Leamington, Ont., on Tuesday, Nov. 10. There were three stakes: a Breeders' Stake, a Derby and an All-Age Stake. Major J. M. Taylor, the well-known field trial authority, judged and gave good satisfaction, though there was not the ready finding of birds which we would like to have seen; no fault of the dogs entirely if at all, for the birds were not plentiful enough for the dogs to make plenty of points and finds upon, and the grounds not proving up to expectations.

The Breeders' Stake.

The trials opened with the Breeders' Stake, five starters, and the winners were: Brighton Joe, first; Blacksie won second; Heather Bloom, third; and Joe Handy won fourth.

The first two dogs were Brighton Joe and Heather Bloom, the first a white pointer owned by T. G. Davey and handled by James McGregor, and in breeding by Plain Sam—Beppo's Mollie. The other was a black, white and tan setter bitch (Dash Antonio—Bly), owned by H. Marshall Graydon, handled by J. Spracklin; and they began the heat a few minutes before 9 o'clock, and the weather was raw and cloudy. They were running only a short time when Joe flushed a bird and in a moment he flushed the rest of the bevy. They were taken then to the scattered birds in the woods, and Joe made a very good point on a single bird and Bloom made a flush. They were then sent on to find a new bevy, and after working out a few fields Joe found one and pointed it in grand style and Bloom did the backing honors. The bevy was flushed close by the fence and the dogs were then worked on scattered birds, and Joe got two very nice points on them, and this work ended the heat. Time was about 9:40. Joe was the best hunter and his point work on birds was excellent. There was not very much difference in their speed and range. Bloom had some good opportunities to make a good score on points, but did not take advantage of them.

The next brace was Leamington Pointer Kennels' liver and white pointer dog Joe Handy (Plain Sam—Blondie), handled by H. Milliken, and N. Stewart's black and white dog Blacksie, bred the same as Joe is, and handled by his owner. They got the word at 9:45. They were not successful in finding game for a long time, nearly an hour. They came to a bevy and both made game, Joe discovering the scent first; but they seemed to be uncertain, not to say inefficient, in locating the bevy, which was in a good place for pointing, near a fence; but they did make a poor point where they ought to have made a good one, for they had the wind of the birds and were not far from them. Then on the scattered birds Blacksie made a point, but they seemed to be poor workers on the scattered birds, for they went time and again where the birds were without getting a point. They were under good control, but were different in their ways of hunting; for Blacksie was more cunning in beating out his ground, though not so pleasing in his way of ranging. Blacksie made another point, but did not hold it long enough, and when he moved the bird flushed. The heat ended at 10:59.

The bye dog, J. B. McKay's Irish setter dog Drenagh (Finglas—River Rose), handler, James McGregor, started about 11 o'clock, and the judge gave him a good trial of an hour and he had good opportunities to point on a bevy and some scattered birds, but he made all flushes instead and the grade of his work was very poor.

Second Series.

Four dogs were taken in to try further for the prizes, and after lunch Joe Handy and Heather Bloom started at 1:28. There were some marked birds on which the dogs were worked with no good results, Joe in particular losing a chance or two to point single birds. They ran nearly an hour.

Brighton Joe and Blacksie ran the concluding heat. After Joe made a false point both made game, Blacksie first; Joe first to the birds, for he was the quickest in locating. Blacksie did not respect the point, for she went by and the birds flushed. They started at 2:22 and ended at 3:01.

The Derby.

This stake was practically a repetition of the Breeders' Stake, and there was not a keen interest to see the same dogs run over again. There were four starters: Joe Handy and Brighton Joe and Drenagh with Heather Bloom. The cloudy and threatening weather settled into a rain toward night, about 4:30, and stopped the work sooner than was expected; but as it was near night not very much time was lost.

Drenagh and Heather Bloom started at 3:05. There were some marked birds kept in mind and the dogs were worked on them. The work of both was poor, for though they seemed to be able to recognize the scent they were poor at locating, and flushed instead of pointed. They were given about an hour's trial and then were ordered up.

Brighton Joe and Joe Handy were put down at 4:03 and they were run an hour, and had the misfortune to find nothing, though they were busy workers. The rain then stopped the work.

Conclusion of the Derby.

Wednesday opened bright and pleasant, but there was a lot of water standing on the ground as the result of the floods which had poured down through the night. The result was that only five bevies of birds were found during the Derby running and in the All-Age Stake, so that the merits of the dogs had to be determined from what they did aside from pointing.

The third series began with Heather Bloom and Joe Handy. These were put down at 3 P. M., when a large bevy flushed from Marygold took to the woods. The only bird flushed by the dogs was a single one put up by Joe, although the puppies hunted faithfully. They were ordered up at 3:30. Heather Bloom did the best work and covered most ground.

Brighton Joe and Heather Bloom were put down for five minutes at 4:42. This wound up the Derby, and at supper the awards were announced as follows:

Brighton Joe first, Heather Bloom second, and Joe Handy third; Drenagh the diploma.

The All-Age.

First Series.

The entries in the All-Age stake were:

LUCY—MISFORTUNE.—Thomas G. Davey's liver and white pointer bitch Lucy (Ridgeview Faust—Peggy), handled by owner, and Marshall H. Graydon's black, white and tan English setter bitch Misfortune (Cincinnatus—Canadian Queen), handled by Joe Spracklin.

LOCK—BRIGHTON DICK.—Richard Bangham's black, white and tan English setter dog Lock (Locksley—Liddersdale), handled by Joe Spracklin, and T. G. Davey's black and white English setter dog Brighton Dick (Brighton Tobe—Brighton Lady), handled by owner.

DASH ANTONIO—LUKE.—Richard Bangham's black, white and tan English setter dog Dash Antonio (Antonio—Lady Lucifer), handled by Joe Spracklin, and W. B. Wells's black, white and tan English setter dog Luke (Toledo Blade—Cambriana), handled by A. Wells.

COBWEB—MARYGOLD.—A. Harrington's b. and w. tic. pointer dog Cobweb (Plain Sam—Pope's Trixey), handled by owner, and Leamington Pointer Kennels' liv. and w. pointer bitch Marygold (Count Graphic—Beppo's Mollie), handled by H. Millken.

The first of the eight went down at 8:15. They were Lucy and Misfortune. Both went well and the birds were being flushed by the judge and scattered, the dogs were worked along a fence row, where Misfortune made a strong point, but Lucy refused to honor it. In the open field Lucy pointed a single, and subsequently put it up. Then in the woods Misfortune flushed a single, after which both dogs pointed, but without locating the game. Both showed good training and obedience; Lucy made the best impression, for she covered more ground and was superior in range and speed.

Lock and Brighton Dick were put out at 9:22 and ran for an hour and a quarter, finding nothing, although both worked and covered the ground thoroughly. Dick appeared to be the better of the two in his hunting, although they were practically equal in speed and range.

Dash Antonio and Luke ran from 10:48 to 12:10. Luke started the ball by flushing a bevy into the woods, where he followed, but although the dogs made strenuous efforts only one bird could be found, the ground being wet and difficult to make any record on. Afterward Dash did better work on dry ground, finally passing into the woods and disappearing for thirteen minutes. Luke was hunted on open ground until 12:10, when he was ordered up. Shortly after his handler brought in Dash.

Cobweb and Marygold were hunted for some time after lunch before anything was done. Millken claimed a point for Marygold, although she was not seen at the time of claiming the point. Moving in the direction four birds had taken, one of these she flushed. Subsequently in new ground Cobweb pointed two pigs, although Marygold knew better than to honor such a point. Subsequent to this there was a claim put in by Millken that Cobweb was sitting down. The judges did not accede to this, but took the ground that the dog was standing and in good position. In a field of corn Marygold, having gone through the standing rows to the lower end, again started around into the corn and flushed a large bevy, although the wind was favorable to her. The brace was ordered up at 2:01, and the second series followed.

Second Series.

Lady and Lock went down at 3:20, Lock soon making game along a weedy fence. Lady working off into the corn. Afterward Lock pointed a single and then following it up pinned the rest of the bevy, Lady also making game, but scoring a flush. The brace was taken up at 3:47.

When Dash Antonio and Brighton Dick were sent out after a bevy which had settled in a wood near by, Dash scored the first point on a bevy and again pointed on a blank or a bird, it could not be determined which. He showed a superiority in range, pace and general hunting, and won the heat. They were taken up at 4.18.

Then Luke and Misfortune worked for twenty minutes without any result, although Luke showed good hunting, particularly in pace and range. The awards were Dash Antonio first, Brighton Dick second, Lock and Luke equal third.

BEESWAX.

E. F. T. C. TRIALS.

The Members' Stake.

THE stake devoted to the competition of the members was run Saturday, Nov. 14, and there were six starters, drawn to run in the following order:

Dr. G. G. Davis's red Irish setter Lou (Finglas—Currer Bell), handled by F. H. Fleer, with Dr. Spencer Brown's b., w. and t. bitch Mollie B. (Roderigo—Lillie B.), owner, handler.

Mr. Pierre Lorillard, Jr.'s, b., w. and t. setter dog Shad (Eugene T.—Lou), owner, handler, with Prof. Edm. H. Osthaus's liv. and w. ticked pointer dog Watt (———— ————), owner, handler.

Theo. Sturgis's b., w. and t. setter bitch Vivian (———— ————), owner, handler, with Mr. Pierre Lorillard, Jr.'s, b., w. and t. setter dog Loris, owner, handler.

Mr. S. C. Bradley judged all classes, and all were thoroughly pleased with the judging.

LOU—MOLLIE B. were put down at 10:55, and ran till 11:35. In about five minutes Lou pointed a bevy; Mollie backed; on the scattered birds Lou made two points and Mollie one; both steady to wing and shot. Lou next pointed a bevy in ragweed field, and was held on point for Mollie to back; birds flushed wild. Mollie made a single bird point and Lou flushed and chased. Sent on, Mollie was found on a point; no birds. In cornfield near ragweeds Mollie again was found on point; Lou backed; the birds were not found then, but were flushed after the dogs were put on chain. Lou had better range and speed, showed good judgment, and her work was of a good class.

SHAD AND WATT were put down at 11:45 and ran 45 minutes. It was a bad time of day for work. Several fields were searched without finding. A bevy was flushed by spectators and marked down in cane. Watt flushed and broke. Shad made a point and the bird flushed wild. Both ranged close at times and took casts at times. The pointer was better in speed and style.

VIVIAN AND LORIS began at 12:50 and ran till 1:45. After some time a bevy was flushed by a handler. On the scattered birds in pines, Vivian and Loris each scored a good point. Sent on in pines, Loris pointed; rabbit probably. On birds marked down in cane and ragweed Loris pointed, and both were steady to shot. The rest of the birds flushed wild and were followed. Vivian made a good point on one; next Loris pointed and Vivian backed.

Lunch was next in order.

MOLLIE B. AND WATT were put down at 2:50. In open fields Watt made a good point on a bevy. They were marked down in open brown sedge. Both made a point at the same time on different singles and were steady to shot. Sent on down in a cornfield, Mollie made a good point on scattered birds. Next Watt made a good point on a single. They ranged about equal, Mollie the better in speed.

VIVIAN AND LORIS were given a better chance as to time of day; time 3:32. Both flushed a bevy together on dry leaves. On the scattered birds Loris made a point, and a few steps further on Vivian made a point also. Next Vivian flushed, and shortly after the dogs were ordered up. 3:50.

LOU AND WATT were cast off at 4:00. Lou flushed a feeding bevy scattered about, then moved on, whirled to a point on footscent and Watt backed. In pines she made three points in quick succession, and Watt made a point on a single. Up at 4:15.

MOLLIE B. AND VIVIAN started at 4:20. Vivian pointed in pines, and a short distance further in open ragweeds Mollie was found on point on a bevy. Both were steady to shot. Sent on, Mollie dropped to two good single bird points. Vivian pointed a single. Sent on, both in pines were found side by side on point on a wounded bird. Down about 15 minutes.

LORIS AND WATT were started about 4:45 in a large stubble field. Neither showed much disposition to hunt. Down about 15 minutes.

The winners were: Lou first, Mollie B. second, and Vivian third.

Lou has a merry way of going; head up and good tail action; has an easy stride, good range and speed; is well broken.

Mollie B. is a diligent worker, good tail action and a sweet disposition; is under good control, and on point she is very snappy.

Vivian is a moderately good ranger, good style on point; was short of conditioning; good speed, moderate range, pleasant disposition.

Mr. Lorillard's dogs showed the effects of hard work, they being a little stale from hard field work prior to the trials.

The handling was excellent. All felt that it was a most pleasing, enjoyable day, and the stake one of the best of the meeting. Mrs. Dr. Brown followed the trials throughout.

It was a sweepstake, $10, 35, 15 and 10 per cent.; first receiving also a water color—a game scene donated by Dr. Brown, a beautiful work of art.

Mr. H. T. Payne, editor and proprietor of *Field Sports*, made FOREST AND STREAM a pleasant call on Thursday of last week. He reports kennel and shooting interests on the coast as being of steady growth and with encouraging prospects. Mr. Payne will attend the field trials at Newton, N. C., thence returning to California to continue the good work.

WESTERN MASSACHUSETTS ANNUAL.

THE ninth annual hunt of the Western Massachusetts Fox Club opened auspiciously at Westfield, Wednesday, for despite the showers that fell during the afternoon a vast amount of excellent sport was enjoyed. In fact, it was one of the most successful and thrilling hunts ever held by the club, even though the number of brushes secured has perhaps been exceeded. The pelts brought in number six. The finest sport of the day was enjoyed in the morning, and the hills about Pochassie, when the dogs were set loose, resounded all the morning and during a portion of the afternoon with the excited tones of a score or more of hounds intent upon running down the sly creatures. The morning was quiet and the ground was just damp enough to hold well the scent of the foxes. The territory hunted over is an ideal one and the foxes shifted about all day within a radius of a few miles, so that the sport did not become tiresome. As soon as one fox was bowled over another would soon be started and the "driving" would begin. In some instances only one or two hounds would be on the scent, while at other times over a dozen would be running together on the scent. The noise of a dozen or fifteen hounds in full cry after a fox must be heard to be appreciated. It is exciting and almost terrifying to the novice, for the jumble of yelps, snarls, barks, whines and the baying makes one almost believe they have gone mad and are engaged in a free fight among themselves. A dozen will make noise enough to cause the uninitiated to be ready to swear there are no less than fifty in the pack. To the old hunter, however, the noise is a pleasant one, for he knows that there is sport ahead and that with such driving the fox cannot be far away.

The start was made yesterday morning at 6 o'clock after bugler Fowler had routed out the hunters by a trip through the streets. The grounds were reached at 7 o'clock, and the teams and 'buses were cared for at the hospitable farm house of William Moore, where dinner was also served. The blood of the hunters was at the boiling point, for on the way to the grounds a fox passed only a few rods in front of the first 'bus, and Charles Brace, of Lee, and his dog Hilda went in hot pursuit. The hunters separated and chose points of advantage both in the valley and on the hill tops. Favorite positions near what were thought to be "runways" were sought, and there all waited for the dogs to get at work. The animals knew well what was going on, and in ten minutes several of the sly reynards were on the run. The popping of guns began, and if all the reports heard meant a dead fox there would have been several score to record. There were many disappointed ones who missed fire and then witnessed some other fellow get the much-desired brush and bear his trophy to the headquarters. It is a fact that nearly all of the hunters yesterday either had a shot at a fox or else saw one or more on the run.

The first pelt was secured by Harry Stiles, of Westfield, at 7:15, but the honor of getting the largest number of "brushes" went to out-of-town guests. As usual, Ben Babb, of Southwick, was on hand and of course got a fox. Others who shot them were A. B. F. Kinney, of Worcester; John M. White, of Millbury; Charles Owen, of Granby, Conn.; and Charles S. Davis, of Meriden, Conn. One fox was shot at by at least half a dozen persons, and it is believed still retains his hide. O. M. Ball, of Worcester, injured a fox on the mountain, but did not follow it up to see if the dogs run it down. In shooting he barely missed a cow. However, Logan, the famous Worcester hound, followed up the fox and must have killed it, for he returned showing the effects of a hard tussle. He was well besmeared with blood and marks on his nose showed where the fox had once had a good grip. The hounds ran splendidly, and of course every man that had a dog in the hunt tells with assurance that "several" foxes were killed before his dog or dogs.

Among the hounds in the field were Logan, Buck, Rock, Fly and Sprague, of the celebrated Kinney-White pack, of Worcester; Burt R. Holcomb's Prince, Betsey, Ben, Fancy and Spot; C. H. Bryant's Buck, Ben Babb's Jack, Tom Montjoy's Fanny and Sancho, Ned of the Chicopee Fox Club; Peter Robinson's Queen and Bingo, of Chicopee Falls; Rock and Rye, Hunter and Trixie, belonging to E. L. and W. N. Walling, of Auburndale; W. W. Holmes's Tolland and Ranger, of Waterbury, Conn., and Charles Brace's Hilda, of Lee.

The annual banquet was served at 6:30 o'clock in Beethoven Hall, and about 125 sat down to the repast that had been prepared by caterer Tyler. An excellent programme of music was furnished by the theater orchestra. Suspended from the chandeliers were three of the foxes that had been shot during the day. The toastmaster of the occasion was E. W. Dickerman, of Westfield. The speaking was the best ever heard at Westfield on a similar occasion. Among those who responded to toasts were: George W. Roraback, of Westfield; Charles L. Holmes, of Waterbury, Conn.; President-elect John T. Way, of Westfield; A. B. F. Kinney, Congressman J. H. Walker, O. M. Ball and E. S. Knowles, of Worcester; W. H. Jones and J. H. Willey, of Boston; H. B. McNulty, of Rochester, N. Y.; Charles L. Holmes, president of the Waterbury, Conn., Fox Club; M. L. Fuller, of Chicopee Falls; D. F. Allyn, John F. Chase and Mark Carpenter, of Holyoke; and F. M. Dillon, of Fitchburg; Charles L. Young, of this city; James H. Bryan, A. S. Kneil, H. W. Ely, L. F. Thayer and William H. Foote, of Westfield; and Charles F. Davis, of Meriden, Conn. Mr. Holmes presented Mr. Roraback with a specially engraved Waterbury watch; and Mr. Dickerman, the toastmaster, was presented with an immense wooden gavel, and a vote of thanks was passed for his services as presiding officer.

Among the out-of-town guests present were: Leander Herrick, G. A. Goddard, Fred Coulsar, Arthur Estabrook, G. W. Barnes, A. B. F. Kinney, of Worcester; John M. White, of Millbury; E. S. and W. N. Walling, of Auburndale; Charles Thompson, of Chicopee; M. F. Slattery, of Lenox; Henry F. Rice, of Sutton; Bradford S. Turpin, of Roxbury, secretary of the Brunswick Fox Club, and representative of the *American Field;* Charles S. Davis, of Meriden, Conn.; Judge Huber Clark, of Willimantic, Conn.; W. W. Holmes, of Waterbury, Conn.; Charles Owen, of Granby, Conn.; W. H. Perkins, of North Grafton, and Gurdon Bill, of this city.

The bugler did not make his appearance Thursday morning and consequently the townspeople were not notified of the start in the second day's hunt. Not as many ventured out as on Wednesday, but there were enough to make things lively and plenty of dogs to rout out the foxes. The sport was rather tame in the morning, but in the afternoon there was some good driving. The success of the last day was small compared with the first, for only one brush was secured. This went to A. B. F. Kinney, of Worcester, who also got one Wednesday. It was reported last night that a second fox had been shot, but this could not be verified. Several foxes were shot at, but escaped, while one or two went into their burrows for safety. The present officers of the club are: President, John T. Way; Vice-Presidents: N. A. Harwood, of Chester; Thomas Hazelton, of Westfield; Secretary, C. M. Goodnow; Treasurer, L. P. Lane.—*Springfield Republican, Nov. 12 and 13.*

POINTS AND FLUSHES.

The following taken from the Chicago *Tribune* may be of more than passing interest to our readers: A pathetic incident occurred on the North Side last Wednesday which gave a curious illustration of the friendship animals sometimes have for each ether. In the neighborhood of the corner of Dearborn avenue and Erie street two very common-looking little dogs might have been seen any day for the last month or two romping and playing with each other or lying in the sun. Wherever one was the other could be found close by. Apparently they shared each other's joys, sorrows, bones and everything else. Some time on Wednesday morning one of the little dogs came to an untimely end. At noon its dead body might have been seen lying in the gutter on the east side of Dearborn avenue, just north of Erie street. From the marks on its head and neck it had doubtless been run over by a wagon. The body lay in the street until Thursday afternoon. During all the time the dog that had been its companion never left the spot. All day long the faithful little cur sat beside its dead playmate. Occasionally it got up to lick the dead face, whining pitifully. It looked the picture of misery. All the coaxing of the people in the vicinity failed to induce the animal to leave its dead friend. At midnight it might have been seen curled beside his dead companion. In this manner the poor little dog remained until about 4 o'clock, when a garbage wagon came along and the carcass was thrown in. The misery and rage of this faithful little animal knew no bounds when it saw its playmate taken away. It had to be driven away by force before the body could be touched. It followed the wagon for some distance, but finally returned to the spot where the body had lain. Ever since the faithful little creature has wandered back and forth, returning always after a short time to the same spot, a very miserable, woe-begone looking little cur. There was something almost human in the whole episode, and nearly every one in the block took a deep interest in it.

Mr. E. Hough, FOREST AND STREAM'S Western correspondent, writes that the beagle trials of the Northwestern Beagle Club were declared off, there not being enough support to make the trials of sufficient interest to run them.

Mr. W. H. Ritchie desires that we mention that the loving cup offered by him for competition in the forthcoming Brooklyn show is not restricted to the competition of members of the Metropolitan Kennel Club, but is open to all.

Wheeling.

Communications for this department are requested. Anything on the bicycle in its relation to the sportsman is particularly desirable.

TANDEM NOTES.

Why is it that tandem cranks are commonly placed so that the riders pedal in unison? No doubt it is because it looks better to see them keeping step than if their legs were in different positions at the same time. But is not a material advantage sacrificed to this adherence to consideration of appearances? With one set of cranks attached at right angles to the other, the dead point that bothers new riders who lack ankle motion and old ones on bad hills would disappear, and the actual work of propulsion would probably be lessened. On engines with more than one set of driving wheels the centers to never correspond.

Which rider should do the steering on a tandem? Frequently the responsibility rests with the rear rider. One reason for this is that when ladies ride they generally occupy the front seat, and it is natural that the man should look after the safety of both. Where two equally skilled riders go out together, however, it would seem as if the steering should devolve upon the front one, as he is in the best position to judge of the road and has a clearer view of wagons and obstacles. We should like to have the subject discussed by those who have had practical experience.

A question of interest to tandem riders is the proper construction of combination machines. In America we are accustomed to place the lady in front, while on the continent her position is generally in the rear. Some of the more recent models here are constructed on the European plan, and it seems that certain riders prefer the arrangement. The advantages of the European method are that all responsibility for steering, signaling with bell and manipulating the brake rests with the man, and in case of collision he also takes the brunt of the shock. On the other hand, it is a fact that a tandem runs better with the heaviest rider in the rear, and this is especially noticeable in hill climbing. Under similar conditions, a tandem also steers easier, on the same principle that an ordinary wheel can best be ridden "hands off" when the rider throws his weight as far back as possible. It is an advantage also to have the stronger rider of the two behind, as he seems to be able to apply his force better in that position, and as it is human nature for the rear rider to do most of the work. Then too this arrangement is easier on the machine, as the chains and crank hangers are saved the work of transmitting the major part of the power.

But most potent of all reasons in favor of our present custom is the fact that the lady likes to ride in front, and naturally chooses that position. In summer she gets most breeze and least dust there, and she also sees better than if the broad shoulders of her friend or lover cut off the view. Her shoulders do not interfere with his view, and if she wears a suitable hat he has no cause to complain in this regard, and if a stray lock of her hair once in a while floats round behind and brushes his face he thinks tandem riding all the better for it.

It seems good and fitting that the lady should ride in front. There she can see and be seen. If she is pretty people coming toward her want to have a look at her, and her companion also feels a little easier to have her where he can keep his eyes on her than riding in his rear along with the flying dust. It is more companionable too to ride that way, and you feel, to quote a writer on the subject, as if you were "taking her out," whereas if she rode on the rear seat you would be merely "letting her go along."

TOURING ON THE CONTINENT.

AT some of the European watering places bicycles are not allowed on the roads at the particular hours of the day when it is customary to visit the springs. Restrictions, especially in Germany, are very rigorous, and the public roads are only open to wheelmen under fixed regulations.

For the benefit of tourists, United States Consul Sawter, at Glauchau, cites some of the stricter rules which wheelmen are called upon to observe throughout the empire.

Particularly in Saxony cycling on public streets and roads is subject to minute and carefully enforced police regulations, and in many cases the use of brakes is obligatory.

Every machine must have an open plate or shield affixed to the brake rod or handle bar, and be provided with a spring lid on which is engraved in clear lettering the name, profession or rank, and residence of the rider.

This rule is mandatory, but for convenience the Consul suggests that the rider's card with address be attached to the handle bar, which would comply with the law and temporarily answer all requirements.

The alarm bell is of course demanded everywhere.

The law requires that the lamp be rather highly placed on the wheel and be kept lighted from within half an hour after sunset to half an hour before sunrise. Furthermore, that the light must shine through uncolored glass.

The brake attached to the bicycle must conform to a certain type, capable of being applied quickly and powerfully. Cycling on roads intended exclusively for pedestrians or on the elevated footpaths and highways is strictly prohibited.

Two bicyclers may ride side by side when it can be done without blocking the thoroughfare or annoying other riders or vehicles; otherwise, single file is the rule.

More than two machines abreast are not permitted under any circumstances. When meeting other bicycles or overtaking them, or when approaching passages of the road where it is not possible to see a long distance, or when reaching a steep descent, the cycler is obliged to give frequent signals with his bell as a matter of strict precaution in avoiding collisions.

Moderate speed must be maintained at all times. Scorching is forbidden on all German highways. At very steep down grades the cycler must dismount and guide his wheel until the descent is passed before remounting.

Cyclers are also required to dismount at any time if called upon by police officials to do so, and are obliged to give such officials any information they may demand. For disregard of any of these regulations a fine not exceeding sixty marks, or $14.28, with imprisonment in jail for not more than two weeks, or both, may be inflicted for each offense.

Consul Sawter says that the German roads are as a rule perfect, and that wheeling is smooth and easy. On account of the rainy weather which prevails most of the year, however, he advises the use of gear cases.

Riding under Difficulties.

NEW YORK, Nov. 11.—*Editor Forest and Stream:* On the last day of October a forest fire burnt over a large part of the Palisade woodlands lying back of Tenafly, N. J. Such fires are of common occurrence in this locality and do little damage besides killing off the smaller underbrush. They start in the carpet of fallen leaves either in the late fall or early spring, and, unlike similar fires in pine or evergreen forests, do not eat their way into the ground and consume the fibrous stratum of decomposed vegetable matter. Consequently they do little or no damage to the trees, and are apparently of more benefit than harm, for they kill out the weeds and leave the woods clean as a lawn for the time being.
